As a field of empirical academic research and legal practice, comparative constitutionalism suffers many of the methodological challenges that have encumbered the fields of comparative law and politics. Apart from the more obvious difficulties of language and the different legal traditions that plague the comparative law project, the sociological and economic contexts as well as each country's particular political history require attention when one is studying the origins and meanings of particular constitutional forms. More recently, the increasing comparative jurisprudence of constitutional and supreme courts in a number of countries has broadened the scope of comparative constitutional law and raised questions about the theory and practice of constitutionalism in the context of a globalizing world. On the one hand, there is a growing attempt to formulate constitutional theories to throw light on the "increasingly cosmopolitan character of constitutional interpretation" (Choudhry, 1999); on the other hand, there is a call for Anglo-American lawyers to recognize the need for a broader legal theory of the state or civil law type *Staatslehre* (Dyzenhaus, 1998) as an essential step toward the formulation of an adequate theory of the relationship between law and political power. It is this relationship that is at the heart of the idea of constitutionalism and the object of research and practice in the growing field of comparative constitutionalism.

Abstract

A constitution is a set of fundamental principles, norms, and laws that govern a political or other organization. The term can refer either to a body of rules and practices that establish the elements of government and allocate government power, or to a foundational written document designed to do the same. Modern national written constitutions generally contain several key elements, including a bill of rights, a division of powers between government entities, and a claim to supremacy over other sources of internal law. The primary functions of constitutions may include intra-government coordination, rule pre-commitment, solidifying power, articulating national identity, and signaling to international audiences.

Introduction

A *constitution* is a set of fundamental principles, norms, and laws that govern a political or other organizational entity. The term 'constitution' can refer either to a body of rules and practices that constitute, allocate, and limit government power, on one hand, or to a written document designed to do the same, on the other. Modern national written constitutions generally contain several key elements, including a bill of rights, a division of powers between government entities, and a claim to supremacy over other sources of internal law. Commonly, either the constitution itself or historical practice mandates that one or more governmental bodies interpret and enforce the constitution's provisions. The primary functions of constitutions may include intra-government coordination, rule pre-commitment, solidifying elite power, articulating national identity, and signaling to international audiences. Though constitutions are most commonly associated with national governments, many sub-national entities and social organizations, such as country clubs and pirate ships (Leeson, 2007), are also governed by constitutions. This article focuses on national constitutions.

Definitions and Conceptual Approaches

Two Meanings

The meaning of the term *constitution* has evolved over its roughly two-thousand-year history. Aristotle (350 BC) termed a constitution 'the way of life' of a polity's citizens. Under modern parlance, the term commonly denotes one of two related concepts, to which scholars often apply the respective terms 'small-c' constitution and 'large-C' constitution.

A *large-C* constitution denotes one or more adopted written documents, often specifically designed, drafted, and ratified over a short period. The term is often associated with a *written constitutional text*. In some cases, the large-C constitution comprises multiple documents, such as with Sweden's and Israel's multi-part constitutions. The large-C constitution usually sets out to define the nature of the government, to identify branches and other actors, to allocate powers, and to limit government power generally. This last objective can be accomplished by stipulating policies, by enumerating rights guaranteed to its citizens or members (a list often referred to as a *bill of rights*), or both. Typically, large-C constitutions assert supremacy over other forms of domestic law. To operationalize this supremacy, written constitutions often, but not always, stipulate that amendments or replacement requires approval from supermajorities of the legislature or electorate, and/or a consensus of sub-national entities.

In contrast, the *small-c* constitution (so-named because it is normally used as a common noun, not as a document title) is generally broader and less formal. It denotes "all rules which directly or indirectly affect the distribution or the exercise of the sovereign power" of the state (Dicey, 1915: 22). Put another way, it includes the "body of rules, practices, and understandings" within an organization that "determines who holds what kind of power, under what conditions, and subject to what limits" (Law, 2010: 377). The small-c constitution therefore encompasses constitutional text, constitutional interpretations by judicial and other bodies, informal conventions, and other precedents. The term is sometimes used synonymously with the term *constitutional law*, as both denote constitutional norms distinct from a strict reading of a written text. Notably, constitutional law can change without formally amending the constitutional text. As a result, a small-c constitution often contains provisions not present in the large-C constitution, and sometimes, the converse is true (Schauer, 2010).

After the American and French revolutions of the late eighteenth century, a global trend began in which states increasingly codified their bodies of constitutional norms with a single written document (Lane, 1996), thereby giving those states both small- and large-C constitutional forms. Despite this trend, notable exceptions exist to this day. For instance, Great Britain has never merged its core laws into a single writing. Instead, the British characterize a collection of unwritten conventions and fundamental documents – including, for example, the Magna Carta and the Human Rights Act 1998 – as their 'constitution.' Notwithstanding Great Britain and a few other countries, most countries today have both forms of constitutions, as do many sub-national entities, such as states, provinces, and municipalities.

Conceptual Approaches to the Written Constitution

Beyond these broad definitions, scholars have struggled to reach consensus on the conceptual parameters of the constitutional text: that is, how to determine which of an entity's written legal provisions comprise its 'constitution,' and which are mere ordinary statutes, aspirational declarations, or the manifestos of autocrats, for instance. Given the important symbolic and identity functions of constitutions, whether or not a set of laws is 'constitutional' is more than a semantic question; among other consequences, it can have meaningful policy implications for a polity's citizens. Especially where corpora have non-constitutional labels, where they lack key common elements, or where they can or are frequently amended or replaced, their statuses as constitutions may be doubtable, and may turn on the conceptual approach applied.

There exist at least two such approaches to defining the parameters of a constitutional corpus: a *nominal* approach and a *functionalist/essentialist* approach. Under a nominal approach, a constitution consists of whatever elements a polity's citizens and policy-makers understand to be its 'constitution' (or the closest native-language translation of the word) (Versteeg and Zackin, 2014). Relative to other approaches, this meaning is both theoretically and practically inclusive; nearly every nation-state now self-identifies some set of its laws as 'constitutional.' To comparative scholars, a nominal approach is attractive because it defers to those arguably best positioned to assess the contours of a constitution: its own creators and subjects. On the other hand, a nominal approach faces practical challenges. Because it places semantics over form, applying a nominal approach can award similar legal corpora constitutional status in one country but not another, possibly frustrating meaningful attempts at comparison. For example, an over fifty-year-old American statute, the Civil Rights Act of 1964, protects fundamental minority rights from both public and private actors. It is considered a deeply entrenched element of American human rights law, making it effectively immune to all-out repeal (Eskridge and Ferejohn, 2001). In those respects, the British Human Rights Act 1998 is similar. But because Britons consider their human rights statute to be constitutional but Americans do not consider theirs as such, a nominal approach would give the two substantively similar statutes different constitutional statuses. This approach could lead the unwary to the false conclusion that only Britons enjoy entrenched legal protection from certain common forms of discrimination.

An alternative, a *functionalist/essentialist* approach, seeks objective, universal standards by which to identify a constitutional corpus. Under this approach, only bodies of law that accomplish certain traditional constitutional functions, or that include certain higher values, are constitutional.

This functionalist/essentialist approach can be divided into functional and normative variants. The functional variant requires a constitution to contain certain traditional functions to be recognized as constitutional. While not all agree on what those traditional functions are, they normally include at least two: empowering principle organs of government, and limiting government power vis-à-vis the citizenry. Other traditional functions include constitutional supremacy and constitutional entrenchment (that is, elevated procedural hurdles to amendment or replacement). Because this approach foists a set of global values on diverse legal traditions, it is vulnerable to the critique that it constitutes a kind of ideational constitutional imposition. The fact that one notion of constitutionalism has attained greater acceptance, critics may say, cannot justify imposing it on societies who prefer alternative versions. In response, defenders might insist that without a universal working definition, it is impossible to make useful comparisons between governmental systems.

The normative variant of the functionalist/essentialist approach applies a form of natural law or some other higher normative criteria to define constitutionality. Under this perspective, there exist certain liberal values, such as equality, personal dignity, and the protection of political minorities, which are fundamental to any constitutional order. This approach takes the view that only constitutions that embody those values are valid constitutions (Dworkin, 1997). While this approach is championed by some noted political philosophers, it has not gained wide acceptance outside of that circle; most comparativists consider even constitutions that oppress minority rights and that recognize few personal liberties (e.g., South Africa's pre-1994 constitution) to be valid constitutions, despite their lacking liberal values (Hardin, 2013).

Common Components

Even under a nominal definition, modern national constitutions display considerable similarity in both their substance and their structural characteristics. First, constitutions tend to share several key substantive similarities. At an abstract level, almost every national constitution contains a bill of rights that recognizes a set of protected higher values. These provisions constrain government by restricting the choices available to government actors. Even so-called positive rights limit the range of choices available to policy-makers by forcing government to undertake certain actions (Zackin, 2013). Nearly every constitution also organizes government functions, usually by establishing a judicial, legislative, and executive branch. In this sense, a constitution enables a government in conducting its political affairs (see Section Constitutional Functions below).

Similarities are also found at a more detailed level. For example, 83% of all countries today task a judicial branch with the power of judicial review (Ginsburg and Versteeg, 2015). Likewise, certain 'generic' constitutional rights, such as the freedom of religion or a right to private property, are adopted by at least 90% of all modern constitutions (Law and Versteeg, 2011: 1200). In some cases, moreover, entire bills of rights are copied from a common source. Most notably, all of the former British colonies in Africa and the Caribbean adopted bills of rights that were largely verbatim copies of the European Convention on Human Rights (Parkinson, 2007). Indeed, empirical research has shown that bills of rights are typically standardized documents (Law and Versteeg, 2011).

Many modern constitutions also share important organizational attributes. First, national constitutions tend to exhibit similar levels of stability. Globally, national constitutions

adopted since 1781 have, on average, been replaced altogether every 19 years (Elkins et al., 2009). Coincidentally, this period is precisely that which Thomas Jefferson believed that constitutions should last. Jefferson argued that "the earth belongs in usufruct to the living," and therefore, that each generation (which he considered to last 19 years) should create its own constitution (Jefferson, 1958: 392). In addition to being overhauled roughly every generation, constitutions are even more frequently amended: every 5 years on average. Another common organizational feature of modern constitutions is that they typically contain a large number of detailed provisions, and they have been growing longer over time. National constitutions comprise 21 960 words on average; the longest national constitution is that of India, with over 170 000 words (Versteeg & Zackin 2014, 113). Many sub-national constitutions also contain numerous detailed provisions. The U.S. state of Alabama, for example, is over 340 000 words long. Yet not all constitutions fit this model. One of the shortest national constitutions is that of the United States, which contains just 7762 words. Notably a constitution's stability and length are related: one study has found that among national constitutions, longer constitutions in OECD countries are amended more frequently than shorter ones (Nardi and Tsebelis, forthcoming 2015).

Constitutional theorists have commonly treated the U.S. Constitution of 1789 as the prevailing constitutional model. Often, they have effectively fused the constitutional tradition of the United States with notions of 'constitutionalism' generally, meaning that constitutional theory has centered largely on American constitutional law. But as the figures above reveal, the U.S. Constitution is in many ways an outlier among national constitutions. With its mere 27 amendments, its over two-hundred-year lifespan, its brevity, and its general omission of positive rights, the U.S. Constitution differs markedly from those of most other countries in several respects. This disparity suggests that constructing constitutional theory chiefly around the U.S. Constitution is an overly parochial approach, which may lead to a distorted view of the global constitutional picture (Versteeg & Zackin 2014).

Constitutional Functions

In light of the now-widespread popularity of written national constitutions, scholars and policy-makers have grappled with the related questions of what functions constitutions can serve and why government actors are motivated to adopt them. Comparative legal scholars and social scientists generally accept that most modern constitutions serve several primary functions. The most common functions likely include intra-government coordination, rule pre-commitment, solidifying elite power, articulating national identity, and signaling to international audiences. Each of these functions may serve the interests of one or more groups, including the governed citizenry, domestic government officials, domestic interest groups, foreign nations, international organizations, and the drafters themselves. Most constitutions are a product of multiple functions, and these functions supplement each other. Together, these functions partially explain the modern universalism of written national constitutions.

Pre-Commitment

One function of constitutions is as a *pre-commitment* device. That is, by promoting legal rules to constitutional status, written constitutions encourage a state to uphold those rules, even as the cost of doing so increases (Elster, 1984). The central premise of pre-commitment theory is that, although governments later may recognize the theoretical benefits of protecting civil rights and other higher values, many governments succumb to opportunism, abandoning rules that become inconvenient. According to pre-commitment theory, constitutions can address this time-inconsistency problem. They do so by creating procedural barriers that raise the cost of changing the rules. Unlike ordinary legislation, changing constitutional rules in most systems requires supermajorities from multiple political entities. Moreover, in systems with judicial review and an independent judiciary, courts nullify new non-constitutional rules that conflict with constitutional ones. Where such mechanisms succeed, constitutional commitments become more credible, thereby preventing a government from reneging on its constitutional promises. This can yield various economic and political benefits for the country (North and Weingast, 1989).

In this sense, constitutions can be likened to the metaphorical ropes with which Homer's Ulysses bound himself to the ship's mast, thereby preventing him from wreaking havoc when the sirens' song drove him insane (Elster, 1984; Homer, 1967). Likewise, a constitution enshrines counter-majoritarian values and creates mechanisms to uphold them, binding society to those values even when popular passions tempt leaders to abrogate them (Elster, 1984). As Stephen Holmes has famously put it, the constitution is "Peter sober," while ordinary legislation is "Peter drunk" (Holmes, 1995: 135).

A notable weakness of constitutional pre-commitment theory is its difficulty explaining why constitutionalizing legal rules have a stabilizing effect, in other words, to explain the nature of the mechanism that renders constitutions self-enforcing (Levinson, 2011). After all, procedural constraints on constitutional change are fallible; supermajorities can amend constitutions, and officials looking to undermine constitutional rules can appoint judges sympathetic to that cause. Indeed, it was exactly this concern that was on James Madison's mind when he noted that the bill of rights provisions in the U.S. Constitution would amount to mere 'parchment barriers' (Federalist No. 48, 1787).

Coordination

The *coordination function* of constitutions helps government actors to synchronize on a single fixed set of rules in order to facilitate more effective government (Hardin, 2013). This function is sometimes analogized to competitive rowers, who must row in-sync to move the boat efficiently, or to automobile drivers, who must all drive on the right (or left) to avoid logjam or collision. To operate effectively, government organizers must likewise agree on how many branches the government will have, how many legislative houses to establish, and how the polity will choose its representatives. Even autocrats and officials with little respect for constitutional rules benefit from the efficiency gains produced by a single set of rules. As Montesquieu

observed, if monarchies were to govern without rules of succession, "the vacancy of the throne [would] always [be] attended with a horrid civil war" (Montesquieu, 1748: 146).

According to some constitutional theorists, the coordination perspective explains leaders' inclination not only to adopt constitutions, but also to comply with them. In this sense, it addresses the 'why constitutions restrain' question with which pre-commitment theory struggles. Coordination theory holds that the constitutional constraints endure in part because they establish conventions that, once created, are costly to change. After a nation has successfully coordinated upon a set of conventions to conduct its political affairs, the cost of deviating from those conventions rises. As Russell Hardin notes, constitutional conventions "raise the costs of doing things some other way" and form "an obstacle to re-coordination" (Hardin, 2013: 60). Though political actors may dislike a given constitutional rule, they nonetheless recognize that having the rules facilitates better government coordination and allows them to exercise power more effectively. The existence of these conventions thus benefits power-holders, rendering the constitution partially self-enforcing.

Citizens are likewise more likely to acquiesce in an imperfect existing set of rules, in part because retaining the status quo is less costly than attempting to re-coordinate on a different set. Citizens recognize that internal conflict, sectarian violence, disruption of government services, and other insecurity can be the price of abandoning an existing legal order. Indeed, according to Hardin, this logic explains why even after the U.S. presidential election of 2000 (in which George W. Bush was elected with a minority of the popular vote), the country never abandoned the unpopular Electoral College method for selecting the president (Hardin, 2013: 60). Thus, unless the costs of maintaining the current order are higher than transitioning to a new one, citizens will acquiesce in existing constitutional arrangements, despite their flaws.

Power-Solidifying

Another potential function of constitutions is to serve constitution-making elites and dominant coalitions by helping them to solidify and consolidate power. Comparative theorists have increasingly applied a strategic-realist approach to explain constitution-making. Under this view, constitution-making is "politics by other means" (Hirschl, 2013: 163–170), in that it reflects the bargains, interests, and self-dealing of domestic elites and interest groups. As Ran Hirschl observes, "strategic behavior by politicians, elites and courts plays a key role in explaining the tremendous variance in the scope, nature and timing of constitutional reform" (Hirschl, 2013: 168). Given that one of the primary goals of a constitution is to create and channel power, it is unsurprising that political actors often take a sharp interest in constitution-making (Cope, 2013a).

In particular, the strategic-realist constitution-making approach posits that constitution-makers push for constitutional arrangements that maximize their personal interests or their institutions' post-ratification utility (Ginsburg et al., 2008: 211). Ran Hirschl has described constitutions as a product of "hegemonic self-preservation." (Hirschl, 2013: 11–12). According to Hirschl's theory, constitution-makers who anticipate losing power may attempt to lock-in values that favor their interests in the constitution and protect them with judicial review, fearing their ouster from office will prevent them from obtaining those benefits through ordinary politics. In a related theory, Ginsburg has posited that constitutional reform is like purchasing "political insurance" that protects ruling coalitions from losing out in the political process after the constitution has been adopted (Ginsburg, 2003, 55–57). This phenomenon may have materialized in South Africa in the mid-1990s, where white elites consented to relinquishing some of their power, but insisted on constitutional protection of property rights from public taking by an African National Congress–controlled majority (Ginsburg, 2003: 55–57).

Symbolism

In most cases, constitutions not only reflect the values and interests of elites, but also proclaim the highest values of the nation generally. In that sense, constitutions can serve an important symbolic function and articulate the nation's identity (Jacobsohn, 2010). By setting out a nation's "core, constitutive political commitments" and with aspirational and historical statements (King, 2013: 81), written constitutions can signal a national identity to audiences in and outside the country.

Both preambles and substantive provisions can accomplish these objectives. Preambles, in particular, present an opportunity to express the distinctive aspects of a country and its people (Cope, 2013a; Galligan and Versteeg, 2013; Tushnet, 2006). According to one commentator, preambles are akin to "mission statements"; they set out the nation's future goals in light of its past experiences (King, 2013). National history can also inspire constitutions' more substantive provisions. For example, as Galligan and Versteeg (2013) note the 1996 South African constitution aims to overcome its apartheid past by emphasizing international rights and authorizing its constitutional court to take account of foreign and international law. Likewise, the 1949 German constitution, enacted in the wake of the Third Reich and the Holocaust, proclaims "human dignity" as one of its basic principles (1949 Basic Law of Germany art. 1). In this sense, constitutions often tell "the stories of the nation's development through many centuries" (Holmes, 1881: 1). (Versteeg, 2014).

International-Signaling

Written constitutions can also serve to signal a willingness to engage with foreign states and the international community. For new countries, for instance, the very act of writing a constitution signals the country's independence. New countries promulgate constitutions for some of the same reasons that they "design[] a new flag, national anthem and postage stamps," that is, to take their distinct place in the international community (Brown, 2002: 10; Duchacek, 1968).

Written constitutions can also serve more strategic international goals. Many constitutions contain provisions written strategically to attract international benefits, such as foreign direct investment, foreign aid, or reputational benefits. For example, some drafters attempt to attract foreign investment by including provisions that protect rights and respect the rule-of-law, thereby using their constitution as a means to

signal good faith intentions (Farber, 2002; Law, 2008). Other constitutional provisions are the product of coercion by foreign donors, who condition aid on the provisions' inclusion (Goderis and Versteeg, 2015). Indeed, both foreign aid donors and international financial institutions often make their assistance conditional upon respect for human rights. To appease donors, then, a country might enshrine such rights in their constitution. Aid donors have also offered technical assistance for rule-of-law reforms that affect the constitution (Hirschl, 2004: 47).

Finally, some studies suggest that written constitutions are used to bolster a country's international legitimacy. A body of sociological literature has demonstrated that the international community is increasingly characterized by standardized models of statehood, including standardized constitutional templates (Meyer et al., 1997; Law and Versteeg 2014, 104; Goodman and Jinks, 2013). A formal constitution that embodies certain values and principles has become a statement of conformity to the values of "world society" (Meyer et al., 1997: 159). To win the acceptance of the international community, states must replicate a standardized script in their national constitutions. Thus, it is possible that states strategically adopt international norms in part to reap reputational benefits.

As a result of such processes, constitutions have increasingly come to resemble one another. For example, there is evidence that for much of the nineteenth century and the early twentieth century, the U.S. Constitution of 1789 served as a model for national drafters, particularly in Latin America (Billias, 2010). Since World War II, however, national constitutions, particularly bills of rights, have increasingly moved toward alternative templates (Law and Versteeg, 2012). Specifically, some evidence suggests that by acting as paradigms of universally accepted rights, post–World War II international conventions were partly responsible for this trend (Elkins et al., 2013). Some authors have observed that the constitutions of Canada and South Africa may also have served as global examples.

Design Efficacy

Though an important constitutional function is binding governments to their promises, it is self-evident and empirically well-documented that constitutional rules are often opportunistically modified or interpreted, or simply not upheld. This concern traces back to at least James Madison, who, as noted above, postulated that constitutions would offer mere "parchment barriers." A constitution can be amended, courts can neglect to enforce constitutional provisions, and officials may ignore those rulings the courts do produce. Some countries simply possess what some comparativists have called 'sham' constitutions (Law and Versteeg, 2013), that is, constitutions whose rules are upheld so infrequently that the constitutions lose any pretext of legitimacy as binding law. Conversely, a few countries, such as Australia, provide relatively robust rights protections despite having no constitutional bill of rights. Such examples of wide disparities between constitutional law and reality raise the question of whether constitutions really 'matter,' that is, to what extent they meaningfully affect the behavior of nations and governments. To date, very few studies have addressed this question empirically (see, e.g., Chilton and Versteeg, work in progress), and those that have, struggle to distinguish correlation from causation. Thus, the question of to what extent constitutional design truly impacts government performance remains largely unanswered.

Despite the lack of evidence that constitutional design matters, there exists a long tradition of constitutional functionalism that involves a searching for the 'best' constitutional principles (Tushnet, 1999; Lutz, 2006). This tradition dates back to the enlightenment era, and its optimism about man's people's ability to use the constitutionalism to shape a better society. Thomas Paine's famous statement that "a constitution is a thing antecedent to government; and a government is only the creature of a constitution" characterizes the belief that constitutions can create government and a more desirable social order. (Paine, 1791). From a functionalist perspective, the constitution is like the nation's operating system for a nation: to perform optimally, a country needs the most up-to-date, technically superior operating system available (Kreimer, 1999). Under this perspective, constitution-makers are engineers with technical expertise to design optimal constitutional solutions. Through constitutional design, constitutions can promote desirable goals such as economic welfare, a lasting respect for rights and liberty, stability, democracy, and conflict mitigation in divided societies.

In recent decades, however, the optimism of the functionalist tradition has waned. Among those involved in constitution-making in different countries, there appears to be a growing consensus that a general constitutional 'recipe' does not exist, and that what works well for one country and time may not work well in others. Indeed, numerous constitutional designs with good track records have failed to constrain governments when implemented elsewhere. Many scholars now agree that "[m]odern constitutionalism cannot be reduced to any particular form or any specific identity or difference" and that "[c]ross-cultural transplantation of constitutional provisions is always dangerous, as an unreflected generalization from experience in a single culture is always likely to be wrong" (Rosenfeld, 1994: 35).

As a result, recent years have seen a growing constitutional focus away from substance and toward procedure. For lack of clear substantive recipes, popular participation has become the new mantra in constitutional design (Aucoin, 2010: xiii). Emboldened by the reputed success of the 1996 South African Constitution, which was drafted with broad public input, there is a growing consensus in the international rule-of-law community that constitutions must be written with widespread popular input, and the people who know what works best for a nation are its citizens. As U.S. Institute of Peace president Richard Solomon summarized the new prevailing wisdom, "there are no one-size-fits-all formulates or models," but "well-conducted processes can … contribute to building stable, peaceful states, whereas poorly conducted processes most certainly undercut such efforts" (Solomon, 2010: xi). Indeed, the last two decades have seen a surge in popular participation in constitution-making, starting with the South African Constitution in 1994, followed by the Ugandan in 1995, the Eritrean constitution in 1997, Thailand's constitution in 1997, the radical populist constitutions in Latin America, and the 2011 crowd-sourced constitution of Iceland.

Constraint-Satisfaction Models

László Egri and Thomas R Shultz, McGill University, Montreal, QC, Canada

Abstract

Constraint satisfaction is the art of finding values for variables in a way that satisfies various constraints. Many everyday problems can be usefully couched in these terms. This survey of constraint-satisfaction models covers both symbolic approaches from artificial intelligence (AI) and neural network approaches from psychology and cognitive science. Initial symbolic AI approaches attempted to solve constraint-satisfaction problems in a hard fashion – either the constraints were perfectly satisfied or there was no solution. Due to its limited modeling capacity, this approach was not particularly appealing to computational modelers in psychology who intuited that the problems people face often have no perfect solutions that satisfy all constraints. Hence, psychological approaches more often turned to the soft constraint satisfaction of artificial neural networks. Newer AI work on constraint satisfaction has made considerable progress in building systems that optimize solutions to hard problems even when it is impossible to satisfy all constraints. The most dominant trends in constraint satisfaction are reviewed and integrated, and forecasts are made for future research and modeling applications.

Introduction

In daily life, regulations, restrictions, and requirements are all constraints that humans must take into account in certain decision processes. For example, staff rosters in hospitals must satisfy restrictions on team composition, personnel regulations, and perhaps preferences. In schools, timetables must be generated in such a way that no teacher will teach two different classes at the same time in two different places. Loosely speaking, a constraint-satisfaction problem (CSP) is a problem in which a search space is given and the objective is to find a solution subject to certain constraints.

Constraint satisfaction has been addressed within two quite different traditions – the symbolic and the neural. The field of artificial intelligence (AI) has mainly adopted a symbolic approach, devising algorithms that manipulate symbols and analyzing the computational properties of these algorithms. The field of psychology has mainly adopted artificial neural network techniques to simulate a wide variety of psychological phenomena. We review both traditions here, identifying their similarities and differences and their respective strengths and weaknesses. We end by suggesting the advantages of greater integration of these two traditions, both for understanding the nature of constraint satisfaction and for implementing successful computer simulations of constraint satisfaction in humans.

Symbolic Algorithms for Constraint Satisfaction

CSPs have been intensively studied in computer science since the 1970s, especially in the subfield of AI. One of the most popular formal versions of the CSP, classical CSP, has the following formulation. A CSP instance is given as a set of variables, a finite domain for each variable, and a set of constraints on the assignment of values to variables. The domain of a variable contains all values that the variable can take. A constraint is composed of a constraint scope and a constraint relation. The constraint scope is a list of variables, for example x_2, x_5, x_7. The constraint relation specifies those value combinations that the variables in the scope can take on at the same time. For example, the relation $\{(a, a, b), (d, c, b)\}$ indicates that the variables x_2, x_5, and x_7 can be assigned either $x_2 = a$, $x_5 = a$, $x_7 = b$, or $x_2 = d$, $x_5 = c$, $x_7 = b$.

A Natural Way to Solve CSPs: Local Consistency Checking

Arguably, the most natural method to solve CSPs is to employ some version of local consistency checking (Lecoutre, 2009). We demonstrate this method in the context of solving a type of crossword puzzle (see Figure 1). Each cell of the puzzle must be assigned a letter from the English alphabet, and therefore we associate a variable with each cell as indicated in the figure.

The domain of each variable x_i is D_i, which in this case is the English alphabet. There are four constraints. The first one is $C_1 = [(x_1, x_2, x_3, x_4), \{(D, R, U, G), (D, O, V, E), (F, O, U, R)\}]$, where (x_1, x_2, x_3, x_4) is the constraint scope and $\{(D, R, U, G), (D, O, V, E), (F, O, U, R)\}$ is the constraint relation. The remaining constraints are

Figure 1 A crossword puzzle. Each column and row corresponds to a constraint scope.

$$C_2 = [(x_7, x_8, x_9, x_{10}), \{(G, O, A, T), (T, O, A, D)\}],$$
$$C_3 = [(x_1, x_5, x_7), \{(C, A, T), (D, O, G)\}],$$
$$C_4 = [(x_3, x_6, x_9, x_{11}), \{(V, E, A, L), (D, E, A, L)\}].$$

The goal is to find a solution, that is, to reduce the domain of each variable to a single letter in such a way that each constraint is satisfied. One strategy is to repeatedly detect and eliminate values in the variable domains that cannot participate in a solution because of some 'local inconsistency.' For example, initially all values of D_1 can be assigned to x_1. Looking at the constraint C_1, we see that if we set $x_1 = A$, then there are no possible values for x_2, x_3, and x_4 such that C_1 is satisfied. Therefore, we remove A from the domain of x_1. Repeating this procedure using the constraint C_1, we can eliminate all values from the domain of x_1 except for D and F. We next look at another constraint that involves x_1, constraint C_3. If we assign $x_1 = D$, we can find values for x_5 and x_7 such that C_3 is satisfied, so we cannot eliminate D. However, when we set $x_1 = F$, there are no values for x_5 and x_7 such that C_3 is satisfied, and therefore we can eliminate F. At this point we know that, in any solution of the puzzle, the only value x_1 could take on is D. Repeatedly reducing the possible values of the variables in this fashion results in the solution shown in Figure 2.

The algorithm we applied belongs to the class of local consistency-checking algorithms. There are many specific algorithms in this class but they all follow the same general principle: they forbid assigning certain values or combinations of values to a bounded number of variables because a certain subset of the constraints cannot be satisfied otherwise, and they repeat this until no more variable assignments can be discarded. A popular local consistency-checking algorithm, the arc-consistency algorithm, is discussed in the next section.

Arc Consistency

One of the most well-known consistency-checking algorithms is the arc-consistency algorithm developed in 1975. The origins of arc consistency go back to Waltz's filtering algorithm designed to automatically generate three-dimensional representations from line drawings of scenes. For simplicity, we restrict our attention to binary constraints, that is, we assume that the scope of all constraints consists of precisely two variables, and that every pair of variables is the scope of precisely one constraint. We say that a variable x is arc consistent with another variable y, if for every value a in the domain of x, there is a value b in the domain of y such that (a, b) is in the constraint relation of (x, y). The arc-consistency algorithm removes values from the domains of variables until all pairs of variables are consistent or the domain of a variable becomes empty.

In Figure 3, we demonstrate how this algorithm works. The CSP instance is shown to the left (stage 1). The variables are x, y, and z, each having domain $\{a, b\}$. The three constraints, one for each pair of variables, are indicated by the edges. For example, the constraint relation for (x, y) is $R_{xy} = \{(a, a), (b, a)\}$. We start by checking if variable y is consistent with x. It is not because if we set $y = b$, there is no value v for x such that (v, b) belongs to R_{xy}. Therefore, we remove b from the domain of y and observe that this is sufficient to make y consistent with x. At stage 2, we make z consistent with x by removing b from the domain of z, resulting in stage 3. At stage 3, we make z consistent with y by removing a from the domain of z. Because the domain of z is now empty at stage 4, we can conclude that there is no solution. This process of removing inconsistent values is often referred to as constraint propagation.

In general, arc consistency is established if the algorithm reaches a point where no domain reduction is possible. At that point, there are a few possibilities. If there is a variable for which the domain is empty, then there is no solution. If each domain has a single value, then there is a unique solution. Otherwise, there might or might not be a solution, and other techniques could be used to make further progress (e.g., search). Other well-known local consistency-checking algorithms are node consistency, path consistency, hyper-arc consistency, and so on.

Complexity and Applicability

CSPs are NP-complete in general. For example, the NP-complete *three-satisfiability problem* can be written as a CSP. In a nutshell, a problem is NP-complete if, given a solution, it can be verified efficiently (i.e., in polynomial time) whether that solution is correct, and the problem is among the 'computationally hardest' ones with this property. It is widely believed that NP-complete problems, and CSPs in particular, cannot be solved in polynomial time.

Local consistency-checking algorithms run in polynomial time, and therefore, as the previous paragraph suggests, they cannot solve every CSP. In fact, these algorithms suffer from a particular one-sided error. If a local consistency-checking algorithm discovers an inconsistency in a problem, then there is obviously no solution. The reverse is not true, however. Once local consistency is established, it is still possible that the given CSP has no solution. For example, consider the CSP in

Figure 2 A crossword puzzle solution, that is, a variable assignment such that variables are assigned values that satisfy each constraint.

Figure 3 Constraint satisfaction by checking binary arcs.

Figure 4 A CSP with local arc consistency, but no solution.

Figure 4, where the variables are x, y, and z, each with domain $\{0, 1\}$, and the constraints are indicated with the edges. This CSP is arc consistent (i.e., every variable is arc consistent with every other variable), and yet it has no solution. If we set $x = 0$, we must set $y = 1$, $z = 0$, and then we are forced to set $x = 1$, but we already set $x = 0$. If instead we set $x = 1$, we can obtain a contradiction in a similar way. It is not difficult to connect this example to the Möbius strip.

From a theoretical point of view, the power of local consistency-checking methods is relatively well understood. A popular variant of the CSP is when a list Γ of possible constraint relations is fixed in advance, and any given CSP instance must use relations only from Γ. Based on some technical properties of Γ, it is known whether CSP(Γ) can be solved using only local consistency-checking methods.

Backtracking Search

Backtracking search is an exhaustive search algorithm (depth-first search) that systematically assigns all possible combinations of values to the variables and checks if these assignments constitute a solution. Unlike the previously discussed algorithms, backtracking search is complete in the sense that it is guaranteed to find a solution if one exists. On the downside, the worst-case running time of backtracking search is exponential. From a practical point of view, there are numerous techniques for improving the efficiency of backtracking algorithms: nogood recording, backjumping, heuristics for variable and value ordering, constraint propagation (enforcing some sort of local consistency during exhaustive search to reduce the search space), and so on. The best combinations of these techniques often result in algorithms that can routinely solve large, difficult instances that are of practical importance in a reasonable amount of time. An excellent survey on backtracking algorithms is Chapter 4 of Rossi et al. (2006).

Local Search Methods for Classical CSPs

Local search is a metaheuristic method for solving hard optimization problems including CSPs. The intuition behind a local search algorithm is starting with an imperfect solution and then iteratively improving it until progress halts. For example, assume that we have to schedule exams subject to various space and time constraints. One strategy to obtain a valid schedule would be to start with a reasonable but conflicting schedule, and then to repeatedly change the time and location of those exams that cause the most conflicts.

More generally, a local search algorithm for CSPs initially assigns values to all variables, and then iteratively improves the solution by changing the value of a (few) variable(s) at a time. A natural heuristic to change the value of a variable in an iteration is the min-conflicts heuristic (Russell and Norvig, 2009). Two variables conflict if they violate a constraint (for simplicity, we are assuming that constraints are binary). The min-conflicts heuristic chooses a variable that conflicts with some other variable(s), and assigns it a value that minimizes the number of conflicts. We demonstrate the algorithm with the well-known n-queens problem, which can be easily stated as a CSP. The n-queens problem requires placement of n queens on an n by n chessboard such that no queens attack each other. In Figure 5, a two-step solution for an 8-queens problem using the min-conflicts heuristic is illustrated. For simplicity, we assume that each column contains a single queen and a queen can be moved only within its column. To get from state a to b, we observe that the chosen queen conflicts with the queen in the first and second rows, so it participates in two conflicts. The numbers in the squares indicate the number of conflicts that would result from moving the queen to the given square. There are three squares

Figure 5 Solution of an 8-queens problem in two steps from left to right, using the min-conflicts heuristic. The queen selected for moving is outlined in black.

in which the queen would cause only one conflict. We move the queen to one of those three squares, arbitrarily the square just below its present location. In state c, we obtain a perfect solution.

Local search is very efficient for some classes of problems. For example, even if n is a million, this method solves the problem in about 50 steps. Nevertheless, just like local consistency methods, local search methods also exhibit a one-sided error: they may find a solution, but they may fail even if the problem is solvable due to getting stuck in a local minimum. To remedy this, local search algorithms often involve some sort of randomization to escape local minima. For example, if a state is reached where no local improvement is possible, the algorithm could be restarted with a fresh, randomly chosen initial state in the hope of obtaining a better solution. Simulated annealing is a more sophisticated way of locating a good approximation to the global optimum, briefly discussed in the Neural Constraint-Satisfaction section.

More Flexible CSP Variants

Classical CSPs treat constraints as hard, meaning that any constraint is either completely satisfied or completely violated, and in any solution, all constraints must be satisfied. In certain situations, however, it is desirable to have more flexibility. For example, given an unsolvable CSP instance, we could ask for a solution in which as many constraints are satisfied as possible. This variant of the CSP is called MaxCSP (Freuder and Wallace, 1992). Some other generalizations of the classical CSP that use soft constraints instead of hard ones are, for example, weighted CSP, probabilistic CSP (Fargier and Lang, 1993), valued CSP (Schiex et al., 1995), and semiring-based CSP (Bistarelli et al., 1997). The weighted CSP framework is useful when the satisfaction of some constraints is deemed to be more important than the satisfaction of some other constraints. Here, constraints are associated with weights, and the goal is to find a solution that maximizes the sum of the weights of the satisfied constraints. Note that the MaxCSP is a special case of the weighted CSP.

The probabilistic CSP framework is applicable when the presence of some constraints is uncertain. For example, suppose that a dinner party is to be organized, and some of the invited guests might be willing to eat red meat only with red wine, some of them might be vegetarian, and so on. In this way, the guests impose certain constraints on the dinner menu. However, some guests are unsure whether they will come, and therefore it is uncertain whether they should be taken into account in planning the menu. To model a situation in which the presence of some of the constraints is uncertain, we assign a probability to each constraint (these probabilities are assumed to be independent). The probability that a given variable assignment is a solution to the (unknown) real-life problem can then be computed by multiplying the probabilities that all the violated constraints are not present in the problem. The objective is to find a solution that maximizes this probability.

A powerful generalization of the classical CSP is the valued CSP (VCSP). In fact, all the above CSP variants can be thought of as special cases of the VCSP. For simplicity, we present a restricted version of the VCSP (see Chapter 9 of Rossi et al., 2006 for the general version). A restricted VCSP instance is similar to a CSP instance except that constraint relations are replaced by more general cost functions. A cost function f assigns a nonnegative numerical value or infinity to each tuple. The cost of a solution is

$$\sum_{[(v_1,\ldots,v_m),f]\in C} f(\phi(v_1),\ldots,\phi(v_m)) \qquad [1]$$

where $\phi(v)$ specifies the value of variable v, C is the set of constraints, and $[(v_1, \ldots, v_m), f]$ denotes the constraint with scope $(v_1, \ldots, v_m)$ and cost function f. A solution is an assignment with minimum cost. A model that is even more general than the VCSP is the semiring-based CSP (Rossi et al., 2006).

One approach to solve soft CSPs is to perform a type of exhaustive search referred to as depth-first branch-and-bound (DFBB) search. Other methods are based on inference (e.g., bucket elimination, soft local consistency, etc.) or on a combination of search and inference. An excellent survey on soft CSPs and how to solve them is Chapter 9 of Rossi et al. (2006).

Neural Constraint-Satisfaction

Each unit in a constraint-satisfaction neural network can represent a hypothesis that is interpreted as true when the unit is active and false when the unit is inactive. Connection weights between the units can represent implicational constraints between the hypotheses, whether positive or negative. These connections can be exhaustive, bidirectional, and symmetrical. There can also be external input to some units, reflecting external evidence, and a bias input, reflecting a priori tendencies. The relative importance of these various constraints is implemented by the sizes of weight, input, and bias values. The degree to which the network satisfies all the constraints can be computed as goodness.

In a generic constraint-satisfaction algorithm, the goodness contributed by a particular unit i is defined as

$$\text{goodness}_i = \sum_j w_{ji}a_ia_j + \text{bias}_ia_i + \text{input}_ia_i \qquad [2]$$

where a_i is the activation of receiving-unit i, a_j is the activation of sending-unit j, w_{ji} is the weight from unit j to unit i, bias_i is the bias of unit i, and input_i is the external input to unit i (Rumelhart et al., 1986). Goodness increases when units connected by positive weights achieve similar activations and units connected by negative weights achieve dissimilar activations, and as unit activations come to resemble their biases and their external inputs. Goodness over the entire network is defined as the sum of individual goodness values across all receiving-units i in the network:

$$\text{goodness} = \sum_{i=1}^{N}\left(\sum_{j=1}^{N} w_{ji}a_ia_j + \text{bias}_ia_i + \text{input}_ia_i\right) \qquad [3]$$

Such functions go by different names in different fields: Hopfield networks in cognitive neuroscience, Lyapunov functions in dynamic systems, Hamiltonian functions in statistical mechanics, cost functions in optimization theory, and fitness functions in evolutionary biology (Hertz et al., 1991).

Unit activations are updated so that overall goodness increases or eventually stays the same. The update rules employ net input to a unit i, defined as

$$\text{net}_i = t(\text{int}(\sum_j w_{ij}a_j + \text{bias}_i) + \text{ext}(\text{input}_i)) \quad [4]$$

where int and ext modulate the relative influence of internal and external factors, respectively, and net_i is a function of t. To ensure that net input stays within bounds $[-1, 1]$, t can be further defined as

$$t(x) = \begin{cases} x, & \text{if } -1 \le x \le 1 \\ -1, & \text{if } x < -1 \\ 1, & \text{if } x > 1 \end{cases} \quad [5]$$

If $0 \le \text{net}_i$, the activation of a unit i is computed as

$$a_i(t+1) = a_i(t) + \text{net}_i(\text{ceiling} - a_i(t)) \quad [6]$$

where $t+1$ indexes the updated activation, t indexes the previous activation, and *ceiling* is the highest activation that units can achieve. Equation [6] specifies that, before being added to the previous activation, net input is scaled by distance to the ceiling, thus preventing unit activations from rising above the ceiling. If $\text{net}_i < 0$, unit activation is updated by

$$a_i(t+1) = a_i(t) + \text{net}_i(a_i(t) - \text{floor}) \quad [7]$$

where floor is the lowest activation value. In eqn [7], activations are kept from falling through the floor by scaling net input by distance from the floor before adding to the previous activation. Overall goodness in the network continues to increase until units reach their extreme values or net inputs fall to 0. Keeping net_i within the bounds of $[-1, 1]$ was not in the original formulation of activation updates (Rumelhart et al., 1986), and its absence may not always pose a problem, but we add it here as a precaution. Note that this algorithm is a hill-climbing algorithm and is therefore a form of local search (see section Local Search Methods for Classical CSPs).

Algorithmic Variations

There are many possible variations on this basic algorithm. Activation values can be continuous or binary. Activation updates can be synchronous or asynchronous, deterministic or stochastic, and can minimize energy or maximize goodness. Energy is the negative of goodness.

The dynamics of network behavior can be conceptualized within a multidimensional space in which the activation of each unit is represented as a particular direction. Each point in this space, an activation vector, represents a possible state of the network. Over time, these networks tend to settle into a stable state, and such stable states are referred to as attractors. Attractors can be points, lines, rings, or planes, and their behavior can be stable, cyclic, or chaotic (Eliasmith, 2007). The hypothetical energy landscape of a hypothetical network with multiple fixed-point attractors is shown in Figure 6. Any input pattern in a particular basin of attraction will tend to make the network settle into the attractor state for that basin, similar to a marble rolling downhill. Such fixed-point attractors can simulate memory retrieval, generalization (or assimilation), pattern completion, categorization, and noise reduction.

Initial activations can start at 0 or be preset to other values. Unit biases, inputs, decay, self-connections, and internal and external modulators are optional. Weights can be symmetric or asymmetric. They can be determined by conventional learning algorithms, such as the Hebb rule or the delta rule (Hertz et al., 1991), or be set by a programmer, perhaps on the basis of psychological principles. Recurrent activation updating can also be incorporated into multilayered feed-forward networks that learn with back-propagation of error, in a technique called recurrent back-propagation. This allows for the inclusion of hidden units, enabling the learning of nonlinear functions. Boltzmann machines can also use hidden units, to the same advantage.

Constraint-satisfaction neural networks are not guaranteed to maximize goodness or, equivalently, minimize energy; they are only guaranteed to settle into a local optimum. In networks with stochastic binary units, search for a global goodness maximum can be facilitated by simulated annealing, a process of gradually lowering the temperature (or gain) of the activation update function in order to move networks out of local optima (Hinton, 2007). Stochastic binary units turn on with a given probability. Such networks are called Boltzmann machines because the probabilities of the states are characterized by the Boltzmann distribution in statistical mechanics. If the annealing schedule decreases the

Figure 6 Hypothetical energy contour map with four attractors. An input anywhere in a basin moves toward that basin's attractor.

temperature in proportion to the inverse log of time, then simulated annealing is guaranteed to almost always converge to the globally optimal solution (Geman and Geman, 1984). Unfortunately, following this slow schedule usually exceeds the time required for a complete search of the solution space. In practice, faster cooling schedules may be employed with varying degree of success.

Modeling with Neural Constraint-Satisfaction

A variety of psychological phenomena have been simulated as fixed-point attractors with constraint-satisfaction neural networks. Content-addressable memories are stored and retrieved from cues containing part of the memory content (Hopfield, 2007). For example, provided with cues about a Japanese car company whose name begins with *M* and ends with *i*, many people can retrieve the Mitsubishi brand and recall details of some of its cars.

Values for particular slots in schemas are completed in a way that satisfies constraints imposed by external and internal information (Rumelhart et al., 1986). For example, provided with the cues of stove and refrigerator, other features of a generic kitchen can be accurately filled in.

Two important steps in analogical reasoning concern the retrieval and the mapping of an analogy. Analogies can be retrieved from memory by the parallel satisfaction of semantic, structural, and pragmatic constraints. For example, in trying to find a way to use an X-ray to destroy a tumor, an analogy about using a laser to fuse a filament in a light bulb is more likely to be retrieved than an analogy about using ultrasound to fuse a filament. This is because X-rays are more like lasers than like ultrasound devices. In addition, analogies are mapped onto new problems by satisfying constraints imposed by similarity, structure, and purpose (Holyoak and Thagard, 1989). For an example of purpose, if one is asked to compare Nicaragua with Cuba, any aspect of the two-memory representations may be relevant. However, if one is asked to assess likely political trends in Nicaragua in comparison to Cuba, then only political aspects, such as the characteristics of political leaders or the form of government, need to be mapped.

Favored explanations are those that maximize coherence among hypotheses and evidence. Thus, Darwin's theory of evolution of species is favored by scientists over a creationist account because of superior coherence. The two main evolutionary hypotheses (that species are subject to natural selection and thus evolve) explain many facts that creationism cannot, such as the geographical distribution of similar species and presence of vestigial organs. Moreover, the hypothesis of natural selection explains that of evolution. Further still, natural selection is explained by an exponential increase in population growth coupled with a slower increase in food supply, and there is a close analogy between natural and artificial selection, wherein farmers breed plants and animals to favor certain characteristics. A constraint-satisfaction network simulation confirms that this large difference in explanatory coherence strongly favors evolutionary theory over creationism.

Philosophical analyses can be treated in the same fashion. For example, belief in other minds is supported by providing the best explanation of behavior and by analogies between self and others.

Decisions and plans maximize coherence among goals, subgoals, and actions. In considering legal cases, for example, not only does evidence influence a verdict but a verdict also influences evaluation of the evidence. In both networks and people, this increases the coherence of understanding a case by resolving ambiguities and discrepancies.

Postdecisional cognitive dissonance is reduced as constraints imposed by attitudes, beliefs, and their implications are employed to increase consonance among these mental representations (Shultz and Lepper, 1996). For example, after making a difficult decision, the dissonance created by discovered shortcomings of the choice is reduced by increasing the valuation of the chosen item.

Forming impressions of people involves reconciling information about their behavior and characteristics and the stereotypes held by the perceiver. For example, in a story about a Mafia nun, there is pressure to reconcile the apparently conflicting information.

Attitudes change in a way that increases consistency across attitudes and beliefs. In addition, attitudes become more extreme merely by thinking about them, because neuronal activation change takes time. The more time spent updating activations, the more extreme they become. Moreover, stronger and more supported attitudes better resist persuasive attempts to change the attitude. Persuasion is an input constraint, but its power can be countered by other, interior constraints.

Objects are recognized by matching visual scene information with model features in a consistent way. An input string of letters is transformed within a recurrent feed-forward network into an attractor representing a pronunciation of the corresponding word. Damaging the units or connections of such recurrent feed-forward networks alters the basins of attraction, simulating several neuropsychological deficits such as dyslexia and prosopagnosia.

Oculomotor control has been modeled with line-attractor constraint-satisfaction networks. Ring attractors have been used to model cyclic control of head direction.

Constraint satisfaction also influences the understanding of sentences. Sentence parsing is faster when a sentence is more consistent with a verb's preferred subcategory structure. For example, the verb *claimed* can be used transitively as in sentence 1 or with a complement clause as in sentence 2. Because the latter use is more common than the former, sentence 2 is quicker to parse.

1. The boy claimed the prize.
2. The boy claimed the prize was big.

The constraint-satisfaction neural-network models of such phenomena typically involve a programmer-constructed network in which units can represent beliefs, evaluations, hypotheses, or evidential facts, and the weights between units represent constraints. Positive constraints, such as implication, are implemented by excitatory weights while negative constraints, such as contradiction, are implemented by inhibitory weights. After repeated updating of unit activations with equations such as 2–7, a network settles into a stable state, for which highly active units are interpreted as being believed or wanted, while those with low or negative activations are interpreted as disbelieved or unwanted.

For example, the belief that physical exercise combats obesity, coupled with a negative evaluation of obesity, could lead to a positive attitude toward exercise. Goodness increases with a positive triple product, in this case a minus obesity activation times a minus connection weight times a plus exercise activation. Despite the lack of guaranteed success, computational models using neural constraint-satisfaction routinely produce sensible and useful results and accurate simulations of human performance on simple CSPs.

In some cases, model predictions have subsequently been confirmed by further psychological research. For example, traditional dissonance theory predicted a spreading apart of the evaluation of chosen and rejected alternatives. Interestingly, the constraint-satisfaction model of dissonance reduction predicted a more refined version: a difficult choice between less desirable alternatives would produce a large increase in the evaluation of the chosen alternative, whereas a difficult choice between desirable alternatives would yield a large decrease in the evaluation of the rejected alternative. These more precise predictions were confirmed in a subsequent psychology experiment.

Future Trends in Constraint-Satisfaction Research

Current activities can be extrapolated to predict some near-future trends in research with constraint-satisfaction models. With a few early exceptions (notably, Waltz line labeling and crypt-arithmetic), computational models of constraint satisfaction have focused almost entirely on neural, rather than symbolic, algorithms. This may have been partly due to the inability of early (hard) symbolic algorithms to optimize constraint satisfaction when it was impossible to satisfy all the specified constraints. In contrast, the neural network approach optimizes naturally as an inherent part of processing. However, with the emergence of optimizing symbolic algorithms, perhaps it is time for cognitive modelers to revisit symbolic constraint-satisfaction algorithms. Some of these symbolic frameworks may have more expressive power than neural constraint-satisfaction techniques, and it could be worthwhile to explore their ability to simulate human problem solving.

As of this writing, research on finding efficient algorithms to solve classical CSPs is in a very active phase. In particular, tremendous progress has been made during the last 20 years on identifying all constraint relations Γ such that CSP(Γ) is solvable in polynomial time, and this quest is ongoing. (We note here that polynomial-time solvability of CSPs can also be guaranteed by imposing certain structural restrictions on the inputs and allowing arbitrary constraint relations.) For soft CSPs, current experimental studies indicate that certain algorithmic techniques did not yet reach their full potential, and furthermore, the study of polynomial-time-solvable soft CSPs is still in its infancy. On a different note, an important issue is how soft constraints are obtained, and in particular, there is a demand for appropriate learning or elicitation tools to transform user-specified preferences into soft constraints. Finally, preferences are more variegated than those that can be expressed with current soft constraint formalisms, and therefore further extensions of these frameworks are likely to emerge.

It is quite probable that neural constraint-satisfaction models will be extended to other psychological phenomena. These might include cognitive-balance theory, belief maintenance and perseverance, problem solving, and additional neuropsychological deficits that have not yet been explored.

For both new and current domains, it can be expected that constraint-satisfaction models will be run, not only to cover existing psychological phenomena but also increasingly to predict new phenomena that could guide empirical research.

Efforts might continue to expand the limited memory capacity of current neural constraint-satisfaction networks. For example, the number of patterns that Hopfield networks can store and accurately retrieve is only 13.8% of their number of units (Hertz et al., 1991). Even an entirely local representation scheme, with one unit per item, is more efficient than that. In addition, most multilayered feed-forward neural networks, using distributed representation schemes, are far more efficient than local representation schemes.

Neural network modelers might use some of the heuristics discovered in symbolic constraint-satisfaction research to enhance the power of neural models when faced with more difficult problems. There may also be some deeper relations between symbolic and neural constraint satisfaction that could be explored.

As the complexity of computational models increases, constraint-satisfaction neural networks could form important modules in these more complex models. Their robust ability to memorize, categorize, reduce noise, integrate, and so on makes them promising candidates as building blocks in complex models. An important challenge is to understand how such networks can be controlled in larger models. Such control could involve shifting the network state to another point on an attractor, or possibly require changing from one attractor type to another (Eliasmith, 2007).

The neurophysiology of constraint satisfaction could be more fully explored to the mutual benefit of both modeling and brain research (Wills et al., 2005). Evidence has been found for attractors in the olfactory system of rabbits and cats and in the visual cortex of monkeys. Brain imaging of humans suggests that the anterior cingulate cortex is involved in the monitoring of cognitive conflict and interference, and this can be modeled by neural-network energy. If the human brain is capable of soft, symbolic constraint satisfaction, it should be possible for realistically powerful neural networks to implement such processes. This could require an interesting three-way collaboration of AI, neuroscience, and constraint-satisfaction neural networks.

We conjecture that constraint satisfaction is more common than most cognitive modelers realize. Many of the issues that people struggle with on a daily basis can be usefully construed as CSPs. In this context, we recommend that researchers consider using powerful constraint-satisfaction algorithms as tools for humans. Successful models could possibly become useful adjuncts to human CSP solving by extending, rather than modeling, human abilities. Automating memory-intensive aspects of constraint satisfaction could be particularly helpful.

Abstract

Despite their diversity, constructivist and social constructionist methods share a common concern with revealing the personal or 'local' meanings that characterize an individual or group, and strive for pragmatic utility rather than objective veracity in the usual sense. To exemplify this approach, this article reviews representative constructivist methods, including repertory grid technique, the coding of narrative processes, discourse analysis of public rhetoric, and focus group methodology. Each is shown to have broad applicability and special relevance for research and practice in psychotherapy.

What makes a particular research method 'constructivist' or 'social constructionist' in orientation? In a sense, the answer lies less in the method or technique itself than in the philosophy with which the technique is used. For example, an interview can be conducted to count the number of positive self-statements in the interviewee's verbal output, or to classify him or her according to some extant diagnostic system. However different these aims might be from one another, both could be considered to express traditional research goals associated with applying or creating universally 'true' or valid categories for human experience. In contrast, other interviews might be conducted to tease out a network of personal meanings unique to a particular respondent, to reveal his or her shifting reliance upon different narratives over the course of therapy, to raise questions about the apparent coherence of a particular line of political discourse, or to grasp more clearly processes of consensus or dissent in a group focused on a particular issue. Such interview methods might well be constructivist, as they focus on distinctive patterns or processes of constructing (or deconstructing) meanings in a given personal or social context, without the presumption of universality that attends traditional knowledge claims in psychological science.

More specifically, a research method might be classified as constructivist or social constructionist to the extent that it (1) elucidates 'local' as opposed to 'universal' meanings and practices, (2) focuses upon provisional rather than 'essential' patterns of meaning construction, (3) considers knowledge to be the production of social and personal processes of meaning making, and (4) is more concerned with the viability or pragmatic utility of its application than with its validity per se. This emphasis on local, provisional, and pragmatic assessment of (inter)personal meanings can be illustrated by a closer consideration of four core techniques associated with a constructivist or social constructionist approach, each of which encompasses many different variations. These include repertory grid technique, analysis of narrative processes in spoken or written 'text', discourse analysis, and focus group methodology.

Repertory Grid Technique

Developed within personal construct theory, the repertory grid technique represents a widely used method for studying personal and interpersonal systems of meaning. Because of their flexibility, repertory grids (or repgrids) have been used in literally thousands of studies of a broad variety of topics, ranging from children's understandings of physical science principles and consumer preferences to formal structures of self-reflection within cognitive science and the mutual validation of belief systems between friends. However, their most consistent area of application has probably been in the clinical domain, where grids have been used to assess the meaning systems of clients in psychotherapy, and how these change over the course of treatment. The 'reptest' was initially designed by George Kelly, the author of personal construct psychology, as a means of assessing the content and structure of an individual's repertory of role constructs – the unique system of interconnected meanings that define his or her perceived relationships to others. In its simplest form, the reptest requires the respondent to compare and contrast successive sets of three significant people (e.g., my mother, my father, and myself), and formulate some important way in which two of the figures are alike, and different from the third. For example, if prompted with the above triad, a person might respond, 'Well, my father and I are very self-reliant, whereas my mother is very dependent on others.' This basic dimension, self-reliant versus dependent, would then be considered one of the significant themes or constructs that the person uses to organize, interpret, and approach the social world, and to define his or her role in it. By presenting the respondent with a large number of triads of varying 'elements' (e.g., a previous romantic partner, best friend, a disliked person, one's ideal self), the reptest elicits a broad sampling of the personal constructs that constitute the person's outlook on life and perceived alternatives. These constructs can then be interpreted impressionistically, used as the basis for further interviewing of the respondent, or coded using any of a number of reliable systems of content analysis, conducted either manually or using available computer programs.

Although the analysis of construct content is often revealing, most contemporary users prefer to extend the method beyond the simple elicitation of constructs by prompting the respondent subsequently to rate or rank each of the elements (e.g., people) on the resulting construct dimensions. For example, a respondent might generate a set of 15 constructs (e.g., self-reliant vs. dependent, hardworking vs. lazy, emotionally controlled vs. out of control), on which 10

important elements (e.g., my mother, father, self, partner) could be rated, yielding a matrix of 150 specific ratings that would then be amenable to a wide range of analyses. Although the repgrid was originally devised as an interview-based or paper-and-pencil measure, most contemporary users rely on any of a number of computer programs for their elicitation and analysis, such as the popular WebGrid 5 program available via the Internet.

Although analysis of the grid can focus on simple element ratings (e.g., observing that the respondent views himself or herself as self-reliant, hardworking, emotionally controlled, etc., on a sample of his or her personal constructs), it is typically more helpful to conduct a comprehensive analysis of the grid to discern larger patterns. This might involve correlating and factor analyzing the matrix of ratings to see at a glance which constructs 'go together' for the respondent (e.g., self-reliance is associated with being psychologically healthy, whereas dependence implies weakness), or to learn what people are most and least alike in the respondent's view. These linkages among constructs often suggest why people remain 'stuck' in symptomatic patterns, as when a client resists viewing himself as happy instead of depressed, because the former is associated with being superficial as opposed to deep, or selfish as opposed to selfless. Similarly, patterns of identification among elements in a grid can be clinically informative, with some of these (e.g., degree of correlation between actual self and ideal self) providing useful indices of progress in psychotherapy, while others suggest the person's psychological closeness or similarity to others.

At the most general level, grids can be useful for identifying how 'tightly' or 'loosely' a given person's meaning system is organized, as revealed, for example, by the average degree of correlation among the constructs that comprise it. Like most constructivist methods, repgrids focus on personal or local (e.g., family or organizational) systems of meaning, with no assumption that these generalize to other people. Moreover, repgrids measure construct systems at a particular moment in time, demonstrating meaningful sensitivity to variation across education, psychotherapy, or industrial organizational consultation, rather than presuming to reflect invariant psychological traits or essences. Finally, most users of repertory grids consider the ultimate hallmark of their value to be the degree to which they prompt relevant insights for the respondents who complete them, although some investigators have also demonstrated their validity and reliability in more conventional terms. Assessment methods having some affinity to the grid technique include the laddering technique, which elicits the higher order value implications of the respondent's constructs of behaviors and social roles, and the self-confrontation method, which evaluates an individual's sense of agency and communion with others through an analysis of important life events. A common feature of these methods is their focus on personal structure, viewing meaning in systemic terms that can be depicted visually to enhance its comprehension and discussion by clients or research participants.

Narrative Analysis

Narrative psychology considers thinking processes to be guided by the structures and elements of which stories are composed. Instead of viewing logic as the guiding force behind information processing and meaning making, narrative psychologists view people as organizing life events into plot structures and creating themes that give them significance. This model of organization can be classified as constructivist due to the agentic, creative processes involved in the formation of narratives.

Individuals create stories to help them comprehend and communicate their experiences and interactions in the world. Narratives are generated through the use of language, common scripts, and symbols derived from different cultures and traditions, and therefore are necessarily context dependent. Stories produced are seen as reflecting truths unique to their individual authors and contexts and as rooted within distinctive lived histories.

The narrative perspective has become popular over the last 30 years, and has grown rapidly into a movement in psychology, partly due to its broad relevance across cognitive, developmental, and clinical areas of research. In the cognitive domain, investigators have demonstrated that people inherently organize ambiguous experiences using story schemas and have studied the way that narrative formation structures memory as well as perception of events. Developmental researchers have traced the emergence of children's storytelling competencies, and their progressive shift toward accounting for the perspective of listener versus narrator. Clinical psychologists study how people construct stories to account for difficult life events, such as traumatic life experiences and the death of a loved one, and in so doing find meaning in them. In the domain of psychotherapy, researchers have developed methods for mapping the topical and thematic shifts that characterize client accounts of their experience, relating these to good and poor outcomes. The Narrative Process Coding and System illustrates the use of constructivist methods to identify and characterize narratives from transcribed psychotherapy sessions.

First, an investigator using the system segments the session dialogue into topic units that are identified through shifts in protagonists and themes. For instance, a client might begin a session discussing a conflict he or she is having with a colleague and then shift to examining a marital issue. The identification of topic segments can allow researchers to consider how themes are maintained or changed through discussion and how the interpersonal psychotherapeutic process can act to facilitate narrative development. Second, the researcher codes these topic segments into one of three narrative processes. External narrative sequences are dominated by event description. The recounting of the steps entailed in registering for university would be an example of this narrative sequence type. Internal narrative sequences focus upon emotional and experiential states. For instance, a portrayal of the different feelings present on the first day of classes would exemplify this narrative process. Finally, reflexive narrative sequences entail analysis and interpretation of events and internal reactions in order to understand their significance. An exploration of the meaning for the student of attaining a higher education would be classified as reflexive. Within different psychotherapy orientations, research has suggested specific patterns of narrative process associated with positive outcome. For instance, a shift between internal and reflexive exploration has been associated with successful humanistic psychotherapy.

Like other methods, whether or not the narrative process coding system is 'constructivist' depends on the epistemic intent that guides its use. For example, the system can be used within an objective, experimental model of science to compare the distribution of narrative sequences within different transcripts. Within such a model, results can be tabulated and statistical arguments for generalization of findings can be developed that aspire toward more universal implications. Although useful in some respects, such an application departs from the emphasis on individuality that characterizes most constructivist research. Alternately, this narrative tool can be used in a discovery-oriented framework, and themes identified that represent local, provisional truths. For instance, dominant narrative themes could be identified within the speech or writing of women with eating disorders on the topics of food and body image, and these themes could be explored in relation to the lives of these individual women and their social contexts.

Other narrative coding methods include the identification of core conflictual relationship themes implicit in client accounts of problems with other people; the innovative moments coding system, which tracks moments of change in a client's self-narrative across treatment; and the coding of interviews to establish the degree to which the narrator experiences himself or herself as an origin or pawn in connection with important events. In each case, the epistemic framework within which findings are presented and interpreted will dictate whether or not a method is being used in a constructivist spirit.

Discourse Analysis

Constructivist methods tend to focus on the meaning-making efforts of individuals, families, and small groups, whereas social constructionist methods shift attention to the broader systems of 'languaging' that characterize public speech, disciplinary discourse, or cultural contexts. Thus, the repertory grid method and its ability to uncover an individual's thematic constellation of meanings cogently follows the premises proposed by George Kelly's personal construct psychology, whereas social constructionist methods use social interactions as their unit of analysis and typically follow theoretical work initially presented by Berger and Luckmann. These two sociologists proposed that the study of 'everyday' or 'commonsense' knowledge should be the primary focus of any attempt at studying the social structures that guide individual as well as collective thought and action. Their proposal that knowledge is created and transmitted through social interaction argued for an ontological stance (that is, a claim about the nature of our world) that required an interpretivist epistemology that probed for the idiosyncratic interpretations and negotiations of meaning resulting from everyday practices using common language. Even when applied to individual language users, such methods tend to have a critical thrust, such as when careful 'deconstructive listening' is used to bring to light the hidden assumptions that constrain a speaker's view of what positions are permissible for self or others. Social constructionist methods are in this sense more politically radical than constructivist methods, attempting to uproot oppressive and marginalizing forms of thinking and speaking that have dehumanizing consequences.

An example of social constructionist methods is provided by discourse analysis, the critical evaluation of social 'texts' to reveal their concealed constraints and contradictions. For example, analyses of published debates in the South African parliament in the early 1980s have elucidated the shared assumptions about the superiority of whites held by both liberal and conservative Members of Parliament. Likewise, feminist discourse of the 1970s has been 'deconstructed' to expose the ways in which 'butch/femme' lesbians were marginalized to support a politic that advocated lesbian androgyny. Interestingly, discourse analysts have been especially active in undermining traditional assumptions in psychology, such as the largely unexamined convictions that people ideally function as rational 'selves' and that psychotherapy involves a move toward greater 'reality contact.' As a method, discourse analysis appears to be more an art than a science, borrowing from deconstructive and critical literary theory in order to understand and resist 'dominant narratives' that limit the terms of debate or the permissible range of human variation that is considered 'normal.' It is therefore sometimes used by psychotherapists concerned with helping clients free themselves from the oppressive narratives of their lives, and recover a sense of themselves as the authors of their experience.

Its social constructionist underpinning situates discourse analysis as a potent methodological choice for sociologists as well. By examining the threads of speech acts among individuals, sociologists uncover the metanarrative language patterns that weave together to negotiate societal meanings and group identities as well as maintain institutional power. Through a social constructionist lens, identity is viewed as relationally formulated and coordinated via discourse. It is therefore seen as more fluid than stable and best recognized as a contextualized performance on the social stage rather than the manifestation of an internal and idiosyncratic psyche. Through identity performance, individuals enact social values and communicate membership. Discourse analysis has thus aided sociological researchers in examining how groups such as certain Native American tribes construct norms for being a 'recognizable Indian' or how subcultures such as 'nerd girls' in high school negotiate their gender and societal identity through particularly defining speech acts. Social theorist Michel Foucault's view of discourse as an organizing structure that ultimately imposes rules and limits on what can and cannot be said has influenced many sociologists to examine power and status relations via language. Medical and mental health institutions have been widely studied in this regard.

The social constructionist effort to undermine traditional assumptions within psychology in a seemingly more 'artistic' than 'scientific' manner culminates in the use of the ethnodrama, a dramatic performance scripted from field data such as qualitative interviews, participant observation, and artifact collection. Embracing the critical spirit of deconstruction, ethnodrama aims to disrupt the 'researcher–subject' dichotomy. As performance, immediate and transitory, ethnodrama challenges the latent notions of power and privilege afforded to the researcher, who is otherwise left unchallenged to interpret the lives of those under study. In a performative space, meaning is synergistically spoken and embodied. For example, the

ethnodramatist might coach a group of Hispanic young people to enact their own story of life in their barrio, preserving and amplifying their voices, frustrations and aspirations, rather than dominant stereotypes of their lives, in a way that makes these more audible to observers. Scripts are prepared to be performed as written or left open so that performers can improvise. Actual text from interviews creates dialogue; thematic analysis of field setting data creates plot and structure. Although it is the researcher who writes the script, it is the performers who give it life. Thus, ethnodramatists attempt to bring individuals from both sides of the divide, researcher and participant alike, closer to the multiple meanings contained within the data. In this way, the methodological rationale is informed by the conceptualization of 'self' as proposed by more radical social constructionists: although an individual's ability to feel emotion or think a thought is not questioned, it is argued that the comprehensibility, meaning, and thus 'existence' of any affective or cognitive response are directed by a larger social discourse. Notions of 'self' materialize through repetitive acts sanctioned by cultural norms. We are all performers navigating meaning through our social roles. The researcher is only distinguished from the participant by title, and there is no privileged voice. The ultimate goal of the ethnodrama is to create a space that will empower and promote self-reflection and possibly subversion of oppressive metanarratives.

Something of an exception to this trend toward literary/dramaturgical rather than conventionally scientific methodology is the refinement of conversational analysis, which involves detailed transcription of dialogue between two or more speakers to capture not only the content of the exchange but also points of overlap in speech turns, pauses, lengthening or abbreviation of utterances, and other verbal and coverbal features of oral exchange. Such analyses have been applied, for example, to the negotiation of novel prompts in therapy, as when therapists invite their clients to consider how life would be different if a miracle occurred and their problem disappeared overnight, yielding a clearer understanding of how the two collaborate to open new possibilities for client change. Related social constructionist methods include the analysis of rhetoric, the tropes or moves used to advance a persuasive argument, and textual analysis, which reveals the way in which authors skillfully position themselves and others within the moral discourse of an account, so as to present themselves to best advantage.

Focus Groups

Focus groups first appeared in the 1930s and were used to investigate public reaction to propaganda messages. The methodology was subsequently picked up and propagated by market researchers. It was not until many years later that such groups were used by social scientists. Through its long history the methodology has remained essentially the same: a focus group brings together a small group of people, all of whom share a particular characteristic (e.g., all are registered Democrats or bereaved parents), and engages them in a focused discussion on a particular topic. For example, a researcher might decide to put together a focus group comprising middle-aged adults whose parents have Alzheimer's dementia to better understand the emotional coping strategies used by grown children when taking care of their parents.

Many researchers use focus groups as a cost-effective methodology capable of collecting a wide scope of responses in a single session. When used for this purpose, the focus group is akin to something of a group interview and the resulting data set is regarded as a compilation of discrete responses. However, the methodology's inherently social nature and its ability to engage individuals in deep, sustained discussion make focus groups particularly useful to researchers adhering to a social constructionist view of the meaning-making process, which is seen as occurring through the relational processes of language and culture. Through agreement and disagreement, affirmation and challenge, question and comment, and verbal and nonverbal performance, participants create a social dynamic through which meaning is personally negotiated and socially agreed upon. Thus, from a social constructionist stance, group interaction, in its totality, is the relevant unit of analysis, and not just individual, isolated commentary. The patterns of discourse and interaction shed light on larger sociocultural process of knowledge acquisition for a particular group.

A successful focus group engages participants, encouraging them to share their views and consider the perspective of the others. To this end, careful pregroup planning is crucial. Researchers must consider group size and membership. The recommended group size is between 4 and 12 participants, large enough to include diverse voices but small enough to allow each participant to speak. Group membership considers heterogeneity or homogeneity for personal characteristics such as age, status, etc. Although group membership is usually shaped by the research question, some researchers consider generalizability in their selection process and maximize demographic diversity. Because constructionist researchers embrace the notion of multiple, localized truths and eschew representing their findings as an exhaustive and definite presentation of the phenomena, they are more willing to work with 'biased' groups. Working with an existing group like a gang, for example, allows the researcher access to their slang and mannerisms. Similarly, working with a group others would consider too heterogeneous and thus likely to decline full disclosure, such as a group comprised of teachers and students, allows the researcher to examine nonverbal gestures, pauses, silences, etc., in order to understand how authority negotiates what can and cannot be discussed openly.

Although a rich data set relies on participant interaction, the group facilitator's presence influences group outcome as well. First, much like group size and membership, the script must be thoughtfully prepared and rehearsed in advance. Open-ended questions are the typical preference. Once participants begin to respond to the questions and to each other, the facilitator's role turns to that of a traffic controller, directing discussion and maintaining a sense of order so that all comments and exchanges remain audible and intelligible. Social constructionist researchers acknowledge that the facilitator's presence and style affects group interaction. Rather than attempting to control 'noise' or 'bias,' researchers of this ilk engage in reflexivity, a self-reflective process by which they clarify their own biases and subjectivities and their effect on the data collection process. Reflexivity allows qualitative researchers to properly situate themselves when interpreting their findings.

There are various strategies at a researcher's disposal for analyzing focus group data. The most common strategies employ text analysis of focus group transcripts, while others examine nonverbal data. Analysis may be time consuming, as it can involve transcribing recordings and coding data. Nonetheless, use of focus group methodology is increasing in the social sciences because of the rich data set it offers.

In summary, constructivist and social constructionist methods in psychology are multifaceted in form and diverse in application, but tend to express a shared commitment to revealing the structure of personal and collective meanings and the processes by which they are constructed. Given their convergence with postmodern trends in the human sciences, it is likely that their influence will continue to grow in the future.

Constructivist Theory and Psychotherapy

Abstract

Constructivist psychotherapy is not so much a single model of therapy as it is a metaperspective that informs many contemporary approaches to psychological treatment. This article reviews several traditions of clinical practice that are informed by a constructivist emphasis on meaning-making in personal, family, social and linguistic domains, and notes their extension in the work of numerous international contributors to this perspective.

Introduction

Joined by a shared epistemology emphasizing the active, form-giving role of the mind and language in constructing reality, constructivist psychotherapies encompass a broad range of contemporary clinical perspectives. Beginning with personal construct theory, (Kelly, 1955/1991) which focuses on the idiosyncratic ways in which individuals construe themselves and others, constructivism has grown to influence therapy traditions ranging from the psychodynamic to the cognitive behavioral, and from the humanistic to the systemic. Among the chief contributions of constructivism are its attention to the dialectical processes of identity development, procedures for illuminating the tacit or nonconscious dimensions of lived experience, and methods for studying and facilitating the human penchant toward meaning-making through the construction of narratives. Although external critics express concerns about constructivism's erosion of the idea of objective truth and internal critics dispute the individual versus social basis of the construction of meaning, the growing coalition of constructivist approaches has contributed a fund of novel methods to psychotherapy research and practice.

Constructivist Philosophy

As a philosophical position that emphasizes both personal and social processes of meaning-making, constructivism has influenced several contemporary traditions of psychotherapy (Neimeyer, 2009). For this reason, it is more accurate to consider constructivism as a general approach to understanding people, conceptualizing psychological distress, and fostering human change than to view it as a distinctive 'school' of psychotherapy associated with a particular theorist, preferred method, or specific set of problems requiring treatment. Thus, constructivism is best viewed as a 'metatheory' that has influenced many late twentieth century and early twenty-first century developments in clinical theories as diverse as psychoanalysis, existential-humanistic psychotherapy, cognitive-behavioral therapy, and family systems approaches. In addition, a number of novel psychotherapies have been devised along avowedly constructivist lines, from personal construct psychotherapy, derived from a theory that was formally set forth in the 1950s, to narrative and dialectical therapy approaches that have become prominent only in the last 15–20 years. Appreciating the contributions of these diverse models, therefore, requires a consideration of their core philosophic similarities and the range of concepts and strategies that shape their expression at the level of clinical practice.

If there is a unifying theme that links constructivist forms of psychotherapy, it is at the level of their epistemology, or theory of knowledge. As might be expected, there are alternative forms of constructivism, which vary in the extent to which they acknowledge that a 'real world' exists outside of human consciousness or language. Nevertheless, they are all much more interested in the nuances in people's construction of the world than they are in evaluating the extent to which such constructions are 'true' in representing a presumably external reality (Neimeyer, 2009). This emphasis on the active, form-giving nature of the mind dates back at least to the Italian rhetorician and historian Giambattista Vico (1688–1744), who traced the development of thought to the attempt to understand the world by projecting upon it human motives, myths, fables, and eventually linguistic abstractions. The German philosopher Immanuel Kant (1724–1804) likewise emphasized the transformative character of the mind, which necessarily imposes spatial, temporal, and causal order on the phenomena of experience. From these philosophers, constructivists borrowed a model of knowledge as an active structuring of experience, rather than a passive or receptive assimilation of a reality of 'things in themselves,' uncontaminated by human knowing.

At the threshold to the twentieth century, these themes were elaborated by the German analytic philosopher Hans Vaihinger (1852–1933), whose *Philosophy of 'As If'* asserted that people develop 'workable fictions' (e.g., of mathematical infinity or God) to order and transcend the hard data of experience, and establish distinctively human goals. A similar emphasis on the distinction between our linguistic 'map' of experience and the 'territory' of the world was made by the Polish intellectual Alfred Korzybski (1879–1950), whose system of general semantics focused on the role of the speaker in assigning meanings to events. From these thinkers, constructivists drew the implication that human beings operate on the basis of symbolic or linguistic constructs that help them navigate in the world without contacting it in any simple, direct way. Moreover, they suggested that such constructions are viable to the extent that they help us live our lives meaningfully and find

validation in the shared understandings of others in our families, communities, and societies. 'Postmodern' thinkers who follow in this constructivist vein further stress the extent to which we live in a world constituted by multiple social 'realities,' no one of which can claim to be 'objectively' true across persons, cultures, or historical epochs. Instead, the constructions on the basis of which we live are at best provisional ways of organizing our 'selves' and our activities, which could under other circumstances be constituted quite differently.

Constructivist Psychotherapies

The first person to develop a thoroughgoing theory of psychotherapy along constructivist lines was the American clinical psychologist, (George Kelly 1955/1991). Working in the relative isolation of rural Kansas in the 1930s and 1940s, Kelly confronted the overwhelming psychological needs of farming communities that had been devastated by the twin crises of the Dust Bowl and the Great Depression. This prompted Kelly to design efficient psychotherapeutic procedures in which clients were coached to enact fictional identities in their daily lives for a fixed period of time (usually only 2 or 3 weeks). Working from a 'self-characterization' written by the client, the therapist and a consulting team first drafted an 'enactment sketch' of an imaginary person whose way of construing life differed from, but did not necessarily contradict, the client's own. The client and therapist then practiced this novel role in a series of therapeutic enactments with the therapist playing various acquaintances, authority figures, and family members, while the client simultaneously generalized the role to the actual relationships in his or her life. At the end of this period, the role was consciously set aside, and the therapist and client discussed the extent to which the client's sense of self and social world were permeable and provisional constructions that might be lived out quite differently if viewed in alternative ways. Kelly's 'fixed role therapy' was therefore the first form of brief therapy, and it foreshadowed the use of dramatic and narrative strategies of change incorporated in many contemporary constructivist therapies (Winter and Viney, 2005).

Eventually, Kelly drafted a comprehensive psychology of personal constructs that placed these procedures in a rigorous theoretical context, and suggested diagnostic, therapeutic, and research methods targeting the unique meaning systems that individuals devised to structure and anticipate the themes of their lives (Kelly, 1955/1991). He was the first clinician to make explicit use of a process of case formulation, in which the therapist uses 'professional constructs' in an attempt to understand the client's view of the world, and as a basis for planning therapeutic intervention. Moreover, he originated repertory grid technique to map the client's network of personal constructs, helping both therapist and client identify areas of the client's meaning-making that warranted closer therapeutic attention. Subsequently, repertory grid methods have been greatly extended, implemented in user-friendly computer programs, and applied to a vast range of topics in clinical, personality, social and organizational psychology, through the efforts of an international network of contributors such as Richard Bell, Devi Jankowicz, Finn Tschudi, and David Winter (Winter, 2003).

Interest in Kelly's work remains strong throughout North America, Europe, and Australasia, with contemporary personal construct theorists challenging, broadening, and applying his initial theory to a range of current problems and disorders. The methods that they have developed include brief therapies that aim to facilitate specific changes in an individual's construing, such as the resolution of dilemmas, as developed by Guillem Feixas and his colleagues in Spain; experiential approaches that pay greater attention to the therapeutic relationship, championed particularly by the American psychologist Larry Leitner; group therapy techniques, for example as developed by Kelly's student, Al Landfield; procedures that focus on the shared construct systems of couples, families, or broader social systems, as pioneered by the British personal construct psychologist Harry Procter; narrative elaborations of the personal construct approach, such as that developed by the Italian psychotherapists Gabriele Chiari and Maria Laura Nuzzo; and nonverbal techniques, many inspired by the British educational psychologist Tom Ravenette, but as applicable with adults as with children (Caputi et al., 2012; Chiari and Nuzzo, 2010). Finally, several contemporary scholars have mined the implications of a personal construct view for specific counseling contexts, such as the American psychologists Mark Savickas's (2011) approach to career counseling and Robert Neimeyer's (2012) meaning reconstruction model of grief therapy. A significant feature of this newer work is that it characteristically links classical Kellian themes of personal meaning systems, human agency and a creative, experimental approach to therapy to other trends in humanistic, systemic and social constructionist thought in a way that has fostered the emergence of a more integrative constructivist approach to therapy.

A second tradition of constructivist therapy began to gain momentum in the late 1970s, as an outgrowth of cognitive-behavioral therapies emphasizing the role of the person's interpretations of events in a range of disorders. Michael Mahoney, an American pioneer in the cognitive trend, began to critique its reliance on rationalistic epistemologies that presumed that emotional adjustment was a straightforward matter of making one's cognitions realistic and in line with an observable world. In particular, Mahoney (1991), along with colleagues such as the Italian theorist Vittorio Guidano (1991), began to turn attention to the 'core ordering processes' by which persons construct and maintain a sense of self in a social field. This gave rise to more developmental forms of constructivist psychotherapy, which focused on the periodic perturbation of an individual's conscious identity through confrontation with difficult or traumatic live events. With the creative linguistic contributions of American psychologist Donald Meichenbaum, these therapies began to develop a variety of procedures for enhancing clients' self awareness, empowerment, and adaptability, while helping them reconstruct an emotionally coherent sense of their identities across time. Significantly, this emphasis on identity construction redirected attention to the often tacit, intuitive, and nonconscious processes by which people organize their experience of self and others, extending the more common focus of cognitive-behavioral therapies on people's conscious 'inner dialogue' or 'automatic thoughts.' Finally, the incorporation of Buddhist mindfulness techniques into some 'third

wave' cognitive-behavioral approaches dovetails with the constructivist turn since, as American psychologist Spencer McWilliams points out, there are metatheoretical compatibilities between Buddhism and constructivism in the notion that what we take to be the 'self' and 'reality' are human constructions that are best held in a flexible and provisional fashion.

As the philosophy of constructivism became widespread, it began to permeate even long-standing traditions of psychotherapy, such as psychoanalysis. One harbinger of this trend was the American analyst Donald Spence, who argued that analysis could not unearth the historical truth of the patient's life, but only constitute a procedure for disclosing its narrative truth in the eyes of its author – the client. In keeping with the psychoanalytic tradition, however, constructivist analysts still tend to emphasize the usefulness of accessing and reviewing emotionally significant memories of one's early life, but view these less as veridical 'insights' than as inventions subject to the demand for narrative 'smoothing,' that is, the tendency to rewrite our remembered history in a way that corresponds to our dominant model of who we are.

Although it would not properly be considered a psychodynamic therapy, the coherence therapy developed by American psychologist Bruce Ecker shares with psychodynamic approaches a focus on unconscious meanings that can subvert a client's conscious intentions. Therapy in this vein uses a procedure of *radical questioning*, probing to reveal the deep purposes served by a client's symptoms or difficulties, to reveal the hidden *prosymptom position* that makes the problems important to perpetuate, despite the very real pain associated with them (Ecker et al., 2012). Like other contemporary constructivist approaches, this integrative model of therapy relies more heavily on experiential exploration of the client's meanings (e.g., using visualization exercises and direct statements of the client's 'emotional truth,' those meanings of the problem that account for his or her resistance to change), rather than on the interpretive stance preferred by classical psychoanalysts.

Another long-standing tradition to be influenced by a constructivist position is humanistic-existential psychotherapy, whose emphases on human choice and phenomenology or the study of experience converged with core themes in personal construct theory and related forms of constructivist theory. One outgrowth of this convergence is the *self-confrontation method* devised by the Dutch personality theorist, Hubert Hermans, which uses open-ended questions to elicit those 'valuations,' or important units of meaning that a person uses to structure a sense of her or his past, present, and future (Hermans and Hermans-Jansen, 1995). The client then rates critical life experiences on a standard list of affect terms, which yields measures expressing the degree of self-enhancement, union with others, negative emotions, and positivity associated with each, providing a basis for self-reflection or a method for mapping therapeutic changes in meanings over time. This approach ultimately has grown to integrate the postmodern notion of a 'dialogical self' (Hermans and Dimaggio, 2004) consisting of multiple voices, as in an earlier metaphor of 'community of self' used by the British personal construct psychologist Miller Mair. Therapy aims for the development of coalitions between these different voices or selves, and is a more general example of approaches that facilitate greater coherence in clients' narratives, the stories that they tell about themselves.

A second example of the infusion of constructivist themes into humanistic therapy is the emotion-focused approach of the Canadian psychologist Leslie Greenberg, which emphasizes the role of personal experience and internal conflict in the creation of subjective meaning. For example, therapy might attempt to synthesize two strongly felt and mutually contradictory internal experiences, such as self-contempt and self-prizing. This could involve helping the client vividly experience both stances through the use of a 'two chair' technique, in which the client successively speaks from each position and fosters their integration into a new structure (e.g., self-acceptance). In keeping with constructivist themes, the 'selfhood processes' that are the focus of these approaches are viewed as continually evolving and provisional, rather than a static 'essence' to be simply discovered or actualized.

In a similar way, a social constructionist perspective has revolutionized family systems therapies, as they have adopted a view of therapy as conversation whose goal is to alter the family's 'problem determined system.' In the work of American contributors Harlene Anderson and Harry Goolishian, the therapist functions less as an expert dispensing answers, than as a conversation manager who promotes the sort of exchanges among family members that 'dissolve' old problems by 'languaging' about them in a new way. That social constructionist approaches such as this may be usefully extended to people diagnosed as psychotic, if their psychotic symptoms are regarded as meaningful, has been demonstrated by Jaako Seikkula and his colleagues in Finland. The Italian clinical psychologist Valeria Ugazio has a somewhat different focus, emphasizing the semantic polarities, or polar opposite positions that characterize family conversations, including those with the therapist, and which she considers to be distinctive in different disorders (Ugazio, 2013).

Other family therapists have adopted the constructivist metaphor of lives as stories, and have devised novel means of helping clients free themselves from the 'dominant narratives' that originate in particular families and cultures, and that keep them from feeling like the authors of their own lives. For therapists such as Michael White in Australia and David Epston (1990) in New Zealand, externalizing the problem by reconstruing it as something separate from the client's 'self' provides a useful first step toward recognizing its destructive impact on clients and the relationships in which they are engaged. Therapy can then turn toward recognizing and validating those exceptional moments when a person begins to resist the dominant narrative, and rewrite his or her life story along more hopeful lines. A common theme in these systemic variants of constructivism is their emphasis on the resourcefulness of individuals, families, and communities in resolving problems in living. Accordingly, clinical work is cast as a search for solutions, rather than a diagnosis of dysfunction.

Finally, constructivist influences are apparent in some integrative approaches, such as cognitive analytic therapy, developed by British psychiatrist Anthony Ryle, who drew particularly upon personal construct theory. Indeed, constructivism can be

the basis for a 'theoretically progressive integration,' combining different therapeutic approaches that share constructivist meta-theoretical assumptions.

Critical Perspectives

Despite the creative contributions of constructivism to contemporary clinical practice, challenges to this perspective have been raised by philosophic realists who question what they view as its 'anything goes' relativism. From the vantage point of these external critics, the constructivist emphasis on multiple realities risks undermining conventional understandings of 'truth' as well as 'objective' procedures of research into therapy process and outcome. However, constructivists like American Jonathan Raskin have responded that a respect for the ways in which various people and cultures construe life differently accords well with the diversity and multiculturalism of contemporary life, and actually provides a psychological basis for twenty-first century ethics. Likewise, constructivists have carried out literally thousands of empirical studies, on topics as diverse as the structure of personal meaning systems and the intricacies of change in the process of psychotherapy. As a result, there is a growing evidence base for some forms of constructivist therapy, such as personal construct psychotherapy and emotion-focused therapy, with studies demonstrating comparable effect sizes to those in nonconstructivist therapies, a therapeutic process that is distinctively different from that in more rationalist therapies, and major differences in philosophical beliefs between practitioners of these contrasting approaches to treatment (Metcalfe et al., 2007). Significantly, these efforts have often required the development of new tools for revealing individual and conversational meaning-making, such as the role construct repertory grids and other innovative methods devised by personal construct theorists (Caputi et al., 2012; Neimeyer, 1993), inventories for measuring meaning-making in relation to troubling life experiences, and the narrative process (Angus et al., 1999) and 'innovative moments' coding schemes validated by psychotherapy process researchers (Gonçalves et al., 2010). Thus, it seems unlikely that constructivism will erode the disciplined study of psychological phenomena in an uncritical attempt to embrace all knowledge claims as equally valid.

Tensions also arise *within* the constructivist camp, particularly between personal construct theorists who champion the individual's role in meaning-making and social constructionists like American psychologist Ken Gergen and British theorist John Shotter, who emphasize the extent to which meanings reside in systems of culture and language that precede any given individual. Indeed, such debates are likely to continue, as they challenge the straightforward depiction of the self-as-agent endorsed by constructivists with more humanistic leanings. This same emphasis on the social and discursive construction of reality, however, has sensitized constructivism to issues of familial, ethnic, and cultural meanings, thereby enhancing its relevance and inclusiveness. Ultimately, the challenges faced by constructivist theories and therapies can be viewed as the predictable 'growing pains' encountered by a significant new perspective that promises to help shape the future, as well as the present, of psychotherapy.

Consumer Policy

Christoph Strünck, School of Arts and Humanities, University of Siegen, Siegen, Germany

© 2015 Elsevier Ltd. All rights reserved.

Abstract

Consumer policy aims at protecting and empowering consumers. Consumers are a very large group but they suffer problems of collective actions. This is why governments, consumer organizations, and companies apply tools such as bans, regulations, advice, litigation, or self-regulatory standards. Relations between companies and consumers are asymmetrical, with consumers lacking vital information. Additionally, behavioral economics reveal striking biases: habits, norms, and irrational attitudes shape everyday consumption. Governance of consumer policy is different, however, resting on different ideas and ideologies, as comparative politics shows. Complex digital markets, the service industry, and the quest for sustainable consumption are core challenges to consumer policy.

Introduction

Companies need consumers to sell. Consumers need companies to deliver. The relation between companies and consumers is not as adversarial as between employers and employees. Neoclassic economics holds that markets will provide whatever individual consumers long for: good quality, low prices, and choice at every level. Why consumer policy, then?

Consumers stand on the weak side of an asymmetric relationship. Struggling with information overload and short on time, comparing products is messy. Lots of information biases as well as behavioral biases shape consumption. This is why collective action of consumers is necessary to maintain effective markets. Supposing, mass of consumers buy products with minor flaws. No single consumer will take up efforts to complain or even to sue. This collective behavior leads to economic inefficiency. More fundamentally, people expect governments to safeguard against dangerous products and hazards. Last but not least, consumers also bear political responsibility because buying comes with price tags for others. This is why collective action is necessary.

Consumers are among the largest social groups in society, spanning all categories of social status, gender, age, and cultural attitudes. Consumption is both the basic need and symbol of expression. To consume is not only to buy a good, but also the way consumers use and recycle those goods is at least as important as purchase. Consumption is both individual choice and social behavior, it is deeply rooted in group thinking, norms, and tradition, and it is mostly embedded in households. Yet, consumers are not as well organized as employees, professions, or business groups. Their collective action problems exceed those of most other groups.

Consumers are a large and heterogeneous group that suffers a fundamental dilemma of free riding. Consumers neatly fit in what Mancur Olson called 'diffuse and weak interests' (Olson, 2003): nobody is willing to join collective action because everyone will benefit from it. This is why governments often support and subsidize consumer organizations, especially in Europe. In the United States, foundations and public interest law firms act as political entrepreneurs.

Additionally, governments act on behalf of consumers: they ban dangerous products, they enact safety and quality standards, and they regulate markets to protect consumers. Consumer policy cuts across different realms. As for the United States, agencies such as the Federal Trade Commission, the Environmental Protection Agency, or the Food and Drug Administration are in charge.

Consumer policy is not just government action and collective action of consumer groups. Companies pursue consumer policy, too. A classic example is self-regulation. In most advanced economies, there are self-regulatory bodies of industry. They monitor markets and blame competitors for wrongful practices.

Summed up, consumer policy aims at protecting consumers and empowering them to make informed choices. Governments, associations, and companies carry out consumer policy. Policy tools include bans, standards, obligations, education, information, and litigation. Consumer policy is mainly regulatory policy; it is less distributive or redistributive. Thus, costs and benefits are usually spread quite evenly. You might expect consumer policy to be a cherished subject for politicians, then.

However, consumer policy has to cope with a classic dilemma of cross-cutting policies (Stone, 2012). Most policies have clear boundaries in which government, business, and interest groups are separated from other constituencies. This is the case with social policy, environmental policy, or agricultural policy. With consumer policy, things are different. Consumer issues cut across a whole range of policies. On the one hand, regulatory capture is less likely because there is no 'iron triangle' of vested interests. On the other hand, comprehensive policies are less likely, too. Additionally, when costs are spread evenly it might provoke resistance from all sectors of business. Thus, similar to redistributive policies, consumer policy is shaped by conflicts and ideologies.

Are Consumers Rational: Ideas and Ideologies in Consumer Policy

Every policy faces cleavages that affect collective interests. As for consumer policy, it comes with a price tag for companies. They might have to disclose information on products and yield certain rights to consumers. Lawmakers argue that rules apply to everybody in order to maintain fair competition. Business

groups argue that consumers are sovereign to decide on their own. However, business groups are split over goals and instruments of consumer policy. Companies with high quality standards even support stronger rules to single out lemons.

Yet, the core conflict is about rational consumption. Do consumers act rationally; do they bear full responsibility for what they are doing? The paradigm of rational consumers is rooted in neoclassic economics. Equivalent to perfect markets, consumers are well informed and sovereign. However, institutional economics has hinted that transaction costs for consumers can be high. Additionally, institutional economics highlight asymmetrical relations between companies and consumers, as the famous 'market for lemons' by Akerlof has shown (Akerlof, 1970): buyers of used cars cannot correctly asses the quality of what they are buying. This problem systematically undermines effectiveness of markets. Only institutional rules can guarantee that consumers benefit from markets whose products they cannot compare as easily as textbook wisdom suggests.

Institutional economics paved the way for the 'information approach': consumer policy has to provide special information to make up for disadvantages of consumers. More recently, behavioral economics has cast doubt on the 'information approach.' Experiments show that framing, anchor effects, and habits shape consumption predominantly. Most consumers lack time and knowledge to compare, being stuck in routines and habits. Rational 'choice' is rare; often it is impossible (Albanese, 2006; Hantula, 2012). There are even effects of information overload that confuse consumers.

Additionally, there is no such thing as the average consumer. Social science has detected different types: confident consumers, responsible consumers, and vulnerable consumers (Gronow and Warde, 2001). Instruments and strategies of consumer policy need to be tailored to the needs of different forms of behavior.

These findings undermine conventional arguments on consumption. They also fuel ideological struggles in consumer policy. Should consumer policy just provide information or should it guide consumers? Does soft paternalism clash with individual choice and free markets? Should consumer policy focus on individual consumers or should it support group action? Is the general notion of 'consumers' in line with complex and heterogeneous societies?

Conflicts about ideas and ideologies have unfolded in different countries, embedding different approaches toward consumer policy. Ideas and ideologies not only include assumptions about consumers but also stretch to regulatory devices like the much debated precautionary principle.

Convergence or Divergence: Governance of Consumer Policy in Advanced Economies

For a long time, policies in the United States seemed to be more risk averse when it came to protecting consumers. Research reveals that the tide turned in 1990: since then it was rather the European Union and its member states that invented strict regulatory standards (Vogel, 2012). When it came to pharmaceuticals, chemicals, or food safety, US standards were strictest before 1990. Business groups complained about 'drug lags' and red tape. Deregulation and Reaganomics in the United States boosted cost–benefit analysis as a tool for risk regulation during the 1980s. Lobbying by business groups scaled back the precautionary principle further.

In the European Union, the common market brought about change. Following the Single European Act of 1986, regulatory competition unfolded in Europe. It often came with a 'California effect' (Vogel, 1997): influential countries with high standards of consumer protection served as blueprints. Subsequently, a race to the top went off. It also gave legitimacy to policies of deregulation. The European Commission championed these rules worldwide in order to achieve comparative advantages.

Theoretically and empirically, the precautionary principle is ambiguous. The rule of thumb 'better safe than sorry' can avert risks yet it can also deprive consumers of innovation (Sunstein, 2008). Anyway, the precautionary principle is not just meant to spare consumers risks. It might also serve as an equivalent for old school protectionism.

The history of the precautionary principle proves that motives and hidden agendas of consumer policy are manifold. Consumer policy can also boost the market position of national business. Yet governance is never rationally constructed. It results from a mix of culture, political institutions, lobbyism, and economic structure.

Existing modes of governance treat consumers as citizens, as buyers, or as social groups (Trumbull, 2006). Citizens with their rights shape the 'protection model,' whereas buyers are linked to the 'information model.' Consumers as social and political group nourish the 'negotiation model.' The United States came close to the 'protection model,' Germany largely represents the 'information model,' and most Scandinavian countries have enshrined the 'negotiation model.'

Historically, governance of consumer policy has been shaped by regulatory tradition, legal systems, and other institutional factors. The protection model in the United States emerged because regulatory agencies, common law, and judicial activism paved the way for mobilizing consumers (Vogel, 2012). Vice versa, public interest groups achieved new rights that could be enforced through litigation.

In Germany, ordoliberal tradition of economic policy considered competition to be the key for consumer policy (Kelemen, 2011). Government created a unique endowment, the *Stiftung Warentest* (product testing). It is supposed to provide neutral testing and information that serves all consumers.

In contrast, Scandinavian countries like Sweden have invented institutions like the ombudsman that consumer groups and business groups can turn to. This model does not treat consumers as anonymous buyers but as an organized group that can deal with conflicts. However, the relation is not considered adversarial – as in the case of the United States. Instead, procedures are supposed to mitigate cooperative relations.

In the meantime, there are signs of convergence. Sweden has invented class action for consumer issues, adding some elements of the 'protection model.' Regulatory agencies in Germany will get a mandate of consumer protection, resembling patterns in the United States and the United Kingdom. In addition, the European Union is still planning to bolster

public interest litigation. Consumer rights seem to be a tool of creeping convergence in consumer policy.

Fighting for Rights: Public Interest Litigation and Consumer Policy

Litigation has shaped consumer policy for a long time. Institutional differences between Europe and the United States are still striking. Class action is widely unknown in Europe. Instead, government agencies or associations take the lead in public interest litigation. Contingency fees and tort damages are still much more a feature of US adversarial legalism (Strünck, 2008).

As for the United States, consumer policy got a boost by judicial activism in the wake of the civil rights movement (Epp, 1998). Ralph Nader figured prominently as an early consumer advocate, running 'Public Citizen' as a powerful public interest group (Eisner, 2000). He picked General Motors as his first prominent adversary: his paper "Unsafe at Any Speed" depicted the popular car Corvette as a most dangerous vehicle.

Public interest litigation helped to raise safety standards, to ban hazardous products, and to protect vulnerable groups against risks such as smoking. On the other hand, public interest litigation in the United States averted more comprehensive legislation (Kagan, 2007). There are signs that the European Union officials jump on the bandwagon of class action (Kelemen, 2011). However, national legal systems still restrict the scope of public interest litigation in Europe.

Currently, there is no clear picture in European class actions on the opt-in and opt-out arrangements. Sweden has famously switched to an opt-in system, whereas countries as diverse as Portugal, Spain, Denmark, Norway, the United Kingdom, and Germany have introduced opt-out clauses, at least in consumer protection law (Cafaggi and Micklitz, 2009). Traditionally, European countries pursue opt-in strategies due to their legal tradition of individually authorized lawyers.

The US tradition of opt-out not only raises questions of accountability but also increases the pressure to settle cases prematurely. Contingency fees show the same effect. Interestingly enough, opt-in clauses have the effect of producing lead plaintiffs who are committed and credible toward their members. Most public interest groups can handle opt-in cases better than private attorneys.

Another institutional device that affects the activities of public interest groups is the role of government agencies (Strünck, 2008). In Sweden, for instance, government agencies lead public interest litigation despite its corporatist tradition. In Austria, the federal consumer organization dominates public interest litigation. The role of government touches on the issue of funding of the public interest litigation, as well. Third-party financing is an underestimated factor whenever the scope of representation is at stake. Above all, 'loser pays' rule is predominant in Europe and for public interest groups, it means that cases they are likely to win will not pose any financial burden to them (Hodges et al., 2009).

The 'loser pays' rule also results in high predictability, compared to punitive damages in the United States. It renders legal expenses insurance a predictable business, too. Thus, conditions for external funding are good. This does not necessarily mean that public interest groups can rely on funding from third parties. Some European governments delegate litigation to public interest groups and provide sufficient funding, as well. In Austria, the Ministry of Consumer Protection regularly assigns litigation to the federal consumer organization to carry out (Micklitz and Stadler, 2006).

In other countries like France, membership fees are a vital source of funding of litigation. This, however, creates negative incentives to sue. The same is true for the German *Act Against Unfair Practices*. It allows for skimming of the profits if corporate misconduct can be proven. Consumer organizations are entitled to act on behalf of consumers before courts. Injunctions are almost a standard routine operation for consumer organizations and self-regulatory bodies of business in Germany. The business-based center for competition issues 7000 injunctions every year.

To consumer groups litigation is an ambiguous tool. Depending on funding, they face a time-consuming and very sophisticated legal process. Whether litigation brings in new opportunities to frame public discourses depends on subjects and claimants that are affected. Some types of public interest groups are small, understaffed organizations that run campaigns. They are just not experienced enough to undertake ambitious legal efforts. In addition, campaigning gets quicker media attention for less effort. Thus, it is a strategic choice for public interest groups whether to embark on legal venues at large scale.

Certainly, outcomes for diffuse and weak interests are different when private parties or lawyers act instead of public interest groups. In the European setting, effects are mostly restricted to parties involved in the litigation. It might lead to policy changes if the case is highly salient and expensive and the fear of future litigation may deter the market participants from certain behavior. However, even smaller damages to consumers might harm public interests. In this case, third-party funding and standing rights are crucial factors in whether public interest groups pick up litigation as a strategy.

Litigation aims at enforcing law. Additionally, law firms and consumer groups can call attention to loopholes in legislation, mobilizing political clout to change the law. Historically, litigation has brought about social change, especially in the United States. Attitudes have changed (smoking), and power relations have been affected (abortion). Social change is the main topic of activists who champion 'political consumerism.' This trend revives concepts of collective action in consumer policy.

Fighting for a Better World: New Patterns of Political Consumerism

Empowering consumers is a crucial goal of consumer policy. However, some consumer groups need not to be empowered; they would rather empower other people and the public. Political consumerism is on the rise, not only in the industrialized world. The range of ideas is broad. There are movements that are fundamentally critical on mass consumption and the business of branding (Galvagno, 2011). Others target companies and monitor their activities. They claim that companies are not just businesses but bear political responsibility. Boycotts

and *buy*cotts are launched to change corporate behavior. At the same time, activists want consumers to see the broad picture. In their perspective, consumption is not just to buy and use something; consumption affects life of people everywhere.

Some of those activities have resulted in policy change: governments enacted new standards, a whole range of labels have emerged, and some companies have revamped their codes of conduct (Stolle and Micheletti, 2013). Does this trend increase political participation; does it bring consumers to act as political group?

New forms of political consumerism are 'individualized forms of collective action' (Holzer, 2006). Consumers do not engage as group but act individually. This kind of market-based activity makes up for problems of free riding. If consumers are difficult to organize it is another option to nudge them individually. This is why political consumerism is often equated with voting. In globalized economies with trust in traditional politics waning, 'political shopping' might be an alternative tool of participation.

The figures are striking: people in Sweden and Switzerland seem to be extraordinarily sensitive toward consumption, whereas people in South European and East European countries seem to care least about political consumption. In Sweden and Switzerland, 50% and more people asked had used positive buying in the last 12 months, and more than 30% had boycotted products. In Greece, Portugal, and Hungary figures did not exceed 10% (Koos, 2012).

It is not just postmaterialist attitudes that drive political consumerism. Political and economic variables matter, too, which is why countries show different forms of activism. Several variables account for these differences: The more affluent a society, the more likely are people to use consumption to express political values. Highly concentrated markets in retail services seem to trigger backlashes, too. Additionally, more decentralized political institutions ease political consumption. However, nongovernmental organizations and social movements do not significantly increase the level of political consumption. Apparently, their campaigns still much more focus on other issues that do not translate into critical consumption.

Technology has fundamentally changed opportunity structures. Social media make companies vulnerable to attacks on their reputation. Codes of Corporate Social Responsibility (CSR) are an answer to new waves of political consumerism (Stolle and Micheletti, 2013). Consumer policy indirectly contributes too. The more labeling, the better the opportunity structures (Koos, 2011). Vice versa, labeling results from campaigning.

Social scientists fret over whether critical consumption really resembles political participation. Some stress that people act as 'consumer citizens,' using economic tools for political reasons. Others decry the volatile behavior of consumers. Whatever the motivation for political consumption, environmental risks and labor standards in the developing world are often targets. Thus, consumer policy in advanced economies might help to improve those conditions. Thus, critical consumers primarily care about employees in developing countries.

Political consumerism calls attention to side effects of global production. This also sheds light on risks that consumers in developing countries are facing. Small producers might be exploited to serve the needs of Western consumers. On the other hand, consumers in those countries are exposed to fundamental risks of products, too.

In most developing countries, consumer policy is still in the wake. However, it has to tackle most elementary health risks to consumers, mainly connected with food and pollution. Aside from pollution, it is food safety that is most critical to China's ruling communist party (Jiang and Zhu, 2013).

Consumer policy figures prominently in advanced economies whose markets are regulated. Consumer organizations, the media, and lawyers push governments to act on behalf of consumers. It is not like that in developing countries. Consumer policy in the less developed world is just in the making. This leaves ample room for governments to imitate policies or to invent new forms of governance. Quite generally, changes in society and markets challenge consumer policy.

Challenges to Consumer Policy

Traditionally, safety of products has been one of the core issues of consumer policy. The rise of the service sector has highlighted the issue of quality control. More recently, the financial crisis has shown that even the fiercest competition does not keep consumer from being ripped off. Financial services, old-age provision, and other services are hard to assess for individual consumers. At the same time, those investments are supposed to last for a long time. Often, vulnerable consumers fall victim to services with long-term impact. Thus, creating transparency and setting enforceable quality standards are the main tasks of consumer policy in the future.

Additionally, digital markets pose new challenges. Do users of social media need to be protected against data transfer? In a strict sense, people are 'users' not 'consumers,' of social media. Does traditional consumer policy apply? Transnational shopping through the internet provides lots of advantages and also problems to consumers. Can they enforce their rights if the provider runs its business in a remote place? Can consumers trust providers that run consumer advice online? Regulating digital markets will remain a huge challenge to consumer policy.

Another aspect is sustainable consumption. Here the debate on soft paternalism pops in. Is it OK to nudge consumers in order to ponder sustainable choices? What to do about waste and reuse of products? Do companies primarily bear responsibility or is it consumers, too, who have to act?

A contentious issue in international politics is free trade agreements. The pending Transatlantic Trade and Investment Partnership between the United States and the European Union is a test case. Consumer advocates stir up fears of genetically modified organism entering European markets against the will of consumers. Which level of regulation is up for negotiations?

As for governance, the role of government is likely to change. Consumer policy has mostly been protection by law. However, are governments capable of enforcing the law in ever more complex markets? Alternatively, will litigation and tort damages step in as the more effective precautionary principle?

In fragmented political systems like the United States or the European Union, third sector organizations increasingly

implement policies. Will consumer groups and campaigns take on more responsibility? Will companies engage more in cooperative relations with consumer groups to bolster CSR policies?

The situation in developing countries is different. Grassroots protests against contaminated food or polluted drinking water urge governments to act. Yet, civil society might still be too weak to craft and implement policies themselves. Given the imminent threat of food safety issues and other risks, civil society organizations might pick up consumer policy as a crucial issue. Handling basic risks for consumers is a litmus test for governments' legitimacy; this is even truer in countries where everyday life comes with lots of risks.

Consumer policy has often been scandal driven. Nondemocratic governments might just ride out things. In democratic societies, scandals often punctuate a long time policy equilibrium, opening up space for outsiders to lobby (Baumgartner and Jones, 2002). Future politics and research will show who is able to shape and deliver consumer policy, for which groups, for which goals, and for how long.

Abstract

The history, development, and future trajectory of the field of consumer behavior are discussed. The field's theoretical grounding in the basic disciplines of economics and psychology is reviewed, and a brief history of the field's major conceptual foci over time is provided. Also addressed are the areas of research generating increased attention among the current generation of consumer scholars.

Consumer behavior refers to the acquisition, consumption, and disposal of time and offerings (goods, services, and ideas) by decision-making units. Consumer behavior is pervasive and universal involving, as it does, choices made during the waking moments of virtually all human beings in all societies and cultures. In addition to overt observable behaviors (e.g., purchasing, word-of-mouth communications regarding products and services), consumer behavior also includes the covert psychological states and processes (e.g., motives, learning, attitudes, decision making, past experience) that underlie and influence the overt behaviors. Last, consumer behavior also includes decisions regarding the cessation or lessening of certain behaviors (e.g., smoking; unsafe sex; eating fatty foods).

Though also referring to the covert psychological processes, when used to describe a scholarly endeavor, consumer psychology refers to using distinctively psychological concepts and methods to study consumer behavior. These days, scholars employing clearly psychological concepts and methods to study consumer behavior are more likely to do so from venues other than Departments of Psychology.

The Complexity of Consumer Behavior

Consumer behavior includes often-overlooked layers of complexity such as the following. Offerings may be acquired in ways other than via purchasing, including via renting, borrowing, trading, finding, stealing, as a gift, etc. Similarly, consumption – which occurs over time periods of varying duration (from the almost instantaneous munching and swallowing of a potato chip, through the wearing of a shirt for several years, to buying and living in a home for decades) – generally involves distinct facets, including using, maintaining (e.g., washing the shirt), storing, and retrieving, all or some of which may be repeated over time. Once consumption ends, one may be faced with disposing of the item (or its container). One can decide to throw it away, convert it to serve some other purpose, trade or exchange it for something else, sell it, give it away, etc. Consumer behavior also reflects cyclical and contingent qualities. Having purchased, consumed, and disposed of a tube of toothpaste, we acquire a replacement and repeat the cycle. Car insurance and gasoline are generally acquired contingent upon having acquired (or gained access to) a car.

Time is finite; how we choose to spend it has tremendous implications for virtually all other aspects of our lives. In some respects, one can actually buy and trade time, e.g., paying someone to mow our lawn and free our time for something else. On the other hand, not being limited to the products and services provided by commercial, for-profit entities, offerings come in many forms. They include political candidates, television programs, newspaper articles, leisure time activities, different sections and articles within the same newspaper, etc.

Engaging in consumer behavior involves a number of roles, including behaving as the decision maker, purchaser, and/or user. Often, these roles are confined to a single individual (as when one chooses, buys, and then consumes a soft drink). Alternatively, they may involve two or more individuals (e.g., wife decides, husband purchases, child uses).

Last, consumer behaviors occur not in a vacuum, but in the context of everyday life where they tend to be influenced by numerous external factors, including cultural, social, political, environmental (e.g., not shopping during a snowstorm), and physical (e.g., not wanting to stoop for a product on a low shelf) considerations.

Why Study Consumer Behavior?

As understanding consumer behavior is often the key to business success, many who study consumer behavior come from disciplines (e.g., economics, marketing, advertising, retailing) that support business activities. But why do psychologists find it worthy of study? Discussed in greater detail elsewhere (Jacoby, 1975: pp. 981–985), a few of the reasons are as follows.

First, consumer behavior is a domain providing innumerable opportunities for important, socially meaningful research. Learning how to influence the underprivileged in this country and elsewhere to adopt and increase consumption of products and services good for them and to cease consumer behaviors that are less appropriate or even harmful is one example. Studying why there is so high a rate of noncompliance with physician prescription dosage instructions is another. Second, consumer theory and research have the potential to contribute to the development and extension of psychology itself. Examples of such contributions abound and include the conceptual (e.g., richer, more dynamic ways of conceptualizing

 http://dx.doi.org/10.1016/B978-0-08-097086-8.22004-7

Stimulus-Organism-Response (S-O-R); cf Jacoby, 2002) as well as the empirical (e.g., dynamic, online) methods that enable psychologists to better test dynamic theories regarding how information self-selected by an individual affects that person's higher order cognitive processing (e.g., attitudes, impressions; cf Jacoby et al., 2002).

Third, because of the universal and pervasive nature of consumer behavior, this context provides excellent opportunities for examining the validity and limits of psychological theory. Fourth, consumer research provides numerous opportunities for working with dependent variables that, from the perspective of test subjects, are meaningful and consequential. Fifth, in attempting to understand consumer behavior, one is forced to consider a broader array of factors than is typical in much psychological research. This occasionally leads to seeing relationships that might not have been noted had one not been forced to approach the subject using a broad perspective.

The Evolution of Scholarly Research on Consumer Behavior

Scholarly work on consumer behavior might be said to have begun with economists more than a century ago (e.g., Adam Smith, Jeremy Bentham, Alfred Marshall). These economists held that a person's desire for goods and services generally exceeded the person's ability to pay. Therefore, buying decisions were theorized to result from a rational process during which a value was assigned to each desired offering based upon the person's assessment of that offering's ability to satisfy his or her needs and desires. This want-satisfying ability was termed 'utility' and it was held that consumers would seek to maximize utility. According to these economists, the price of the offering was the key element in the maximizing utility equation. Raising an offering's price was predicted to lower its sales; lowering its price would increase sales. Though seemingly commonsensical, this proposition suggests that, given changes in price, consumers respond like billiard balls, buying when prices are lowered and refraining when prices rise. Nothing else matters.

In terms of the S-O-R model familiar to psychologists, it can be seen that the Economic Man conception is severely limited suggesting, as it does, a relatively empty organism whose behavior is determined by economic stimuli and little else. According to the classic S-O-R formulation, external stimuli (e.g., price changes) first need to be perceived, understood, evaluated, and integrated with other psychological phenomena (e.g., past experience, current needs, attitudes, expectations, etc.) before having impact, if any, on the individual's behavior. Thus, while one can see various reasons why a price decrease would lead to increased purchase (as predicted by economic theory), one can also see various reasons why it would have either no effect (e.g., the price change does not represent a 'just noticeable difference'; the consumer would purchase the same amount of the items regardless), or the reverse effect (e.g., sales decrease because the consumer interprets the price decrease as reflecting a decrease in quality, or because the consumer views the item as no longer having the desired snob appeal; etc.). To best understand and predict consumer behavior, we would have to know something about the consumer's motives, a priori expectations, how the incoming information is perceived and interpreted, and so forth – namely, all the factors traditionally studied by psychologists and then some. Although many key assumptions underlying the 'Economic Man' model have since been shown to be untenable, via a reincarnation termed Rational Choice Theory, this model remains popular among some in law, economics, and sociology (e.g., Posner, 1998).

Responding to limitations in the Economic Man model, both theorists and practitioners began adding variables to the stimulus and especially organism portions of the S-O-R model. The stream of research referred to as behavioral decision theory might be seen as efforts investigating the stimulus portion of the S-O-R model, especially in terms of how stimulus framing results in decisions deviating from normative outcomes. Prospect theory (Kahneman and Tversky, 1979) clearly showed how decision makers felt losses more than equivalent sized gains. During the 1930s through the 1960s, a number of European émigrés trained in Freudian psychoanalysis, collectively known as motivational researchers (e.g., Dichter, 1960), became influential among the business community. Other psychological constructs (including attitude and personality) also were introduced during this period. By the mid-1960s, the emerging models (developed not by psychologists, but by professors of marketing) reflected primarily psychological and/or sociological factors (e.g., Andreasen, 1965; Engel et al., 1968; Howard and Sheth, 1969). The work by Engel and his colleagues, now in its tenth printing, was the most influential introductory text for perhaps 15 years and remains popular. The 1960s also represented the time when an increasing number of psychologists with a scholarly bent began studying consumer behavior. Reflecting evolution, a number of today's leading texts (Hoyer et al., 2012; Peter and Olson, 2012; Solomon, 2012) are authored or coauthored by PhD psychologists.

Two developments did much to shape the emerging field *c.*1970. First came formation of the Association for Consumer Research (ACR, www.acrwebsite.org), today considered to be the principal scholarly organization in the field. Starting with a few hundred members in 1969–70, ACR's membership consists of researchers from a wide variety of disciplines and now numbers nearly 2000, including several hundred psychologists. Though its members focus on different issues (e.g., marketing researchers tend to be more interested in understanding purchase decisions, communication researchers more interested in interpersonal or mass media communication, home economists more interested in problems that may surface during usage, etc.), their shared frame of reference is that, influenced by elements in a complex environment, consumers are information-processing, problem-solving, decision-making, choice-making beings. Its annual series, *Advances in Consumer Research*, best illustrates the diversity of the field.

The second major development was the introduction of the *Journal of Consumer Research* (ejcr.org), the first journal devoted specifically to consumer research. Prior to the early 1970s, scholarly work on consumer behavior appeared sporadically in journals spanning many disciplines. Work having a behavioral science (including psychological) perspective tended to appear in the *Journal of Applied Psychology* and, to a lesser extent, in the *Journal of Marketing* and *Journal of Marketing Research* (www.marketingpower.com). While these journals continue to

publish some of the better consumer research, their principal foci lie elsewhere. The first issue of the *Journal of Consumer Research*, a collaborative venture by 10 national societies appeared in 1974 and quickly became the field's flagship journal. The cosponsoring societies of the inaugural issue were: American Association for Public Opinion Research, American Council on Consumer Interests, American Economic Association, American Home Economics Association, American Marketing Association, The Division of Consumer Psychology (Division 23) of the American Psychological Association since renamed the Society for Consumer Psychology, American Sociological Association, American Statistical Association, ACR, and The Institute of Management Sciences. Societies that have since become cosponsors include: American Anthropological Association, American Association of Family and Consumer Sciences, Institute for Operations Research and the Management Sciences, International Communication Association and the Society for Personality and Social Psychology (Division 8) of the American Psychological Association. Using the first 15 years of *Journal of Consumer Research* publications, Hoffman and Holbrook (1993) provide interesting perspective on the intellectual structure of the field.

The Introduction of Psychology to Studying Consumer Behavior

Interest by psychologists in consumer behavior and the factors that influence such behavior has a 110-year history. In 1900, H. Gale published work on the position of an ad on the printed page in 'The University of Minnesota Studies on Psychology'. In his 1903 book, *The Theory of Advertising*, Walter Dill Scott, whose dissertation on attention and persuasion was with Wundt, introduced the concepts of needs and motives to advertising. Scott's 1908 book (*The Psychology of Advertising in Theory and Practice*) included the word psychology it its title. However, except for occasional articles in the *Journal of Applied Psychology*, psychologists devoted little scholarly attention to consumer behavior during the first half of the twentieth century. When studied at all, consumer behavior was often viewed as a convenient place to test more fundamental psychological propositions. For example, when the United States was experiencing shortages in traditional cuts of beef during World War II, Kurt Lewin's classic studies on public vs private commitment assisted both government and industry in reorienting food consumption away from foods in short supply and making internal meats (e.g., brain, liver, kidney) more palatable to the American consumer. With the exception of Katona (1951, 1953), essentially a voice in the wilderness, few psychologists studied consumer behavior for its intrinsic interest. Situated in industry, most members of American Psychological Association's (APA) Division of Consumer Psychology had an applied orientation and were interested in research that assisted business.

This emphasis began changing in the mid-1960s. The first chapter on Consumer Psychology appeared in *Annual Review of Psychology* (Twedt, 1965). The second appeared (Perloff, 1968), 3 years later, as did a chapter in the *International Encyclopedia of the Social Sciences* (Krugman, 1968). In addition to the traditional focus on the consumer *qua* purchaser (i.e., as the object of business interests), these contributors devoted greater attention to the consumer *qua* consumer. This emphasis became entrenched during the decade that followed (Jacoby, 1975, 1976), gaining even greater strength in the intervening quarter century (Jacoby et al., 1998). By the early 1980s, the dominant focus of APA's Division of Consumer Psychology (which had been renamed The Society for Consumer Psychology) had shifted to studying the consumer *qua* consumer. In 1992, it began publishing the *Journal of Consumer Psychology* (www.journals.elsevier.com/journal-of-consumer-psychology) through Lawrence Erlbaum Associates, a prestigious publisher of works in psychology.

Concurrent with increasing numbers of psychologists finding that consumer behavior merited their scholarly attention, scholars in other disciplines eagerly embraced psychological theory and methods for their own consumer behavior research, with many advising their doctoral students to minor in psychology (particularly social, cognitive, or measurement psychology). This cross-fertilization was enhanced as increasing numbers of newly minted PhD psychologists assumed faculty positions in Departments of Marketing and other disciplines where they studied consumer behavior. Many later became highly regarded scholars and leaders in the field. Adding to this trend, prominent psychologists began participating in Society for Consumer Psychology and ACR conferences, occasionally publishing articles in consumer behavior journals; examples include William McGuire (1976), Robert Zajonc (Zajonc and Markus, 1982), and Daniel Kahneman (Ratner et al., 1999).

Current Content and Foci of Consumer Psychological Research

A psychologist reading today's introductory texts would feel right at home. Even those not (co)authored by psychologists devote chapters to familiar subjects, including motives, attention, perception, categorization, comprehending, learning, memory, attitudes, persuasion, and decision making. Large portions of other chapters are devoted to emotions, personality, values, cognitive dissonance, the self, affect, symbolism, and nonconscious processes. Much of the remaining content tends to be sociocultural in nature, with chapters typically covering cultural and cross-cultural influences, subcultures, social class, reference and other group (e.g., age, gender, race, religion) influences, and family and household considerations.

Though consumer researchers study a wide variety of psychological constructs, phenomena, and topics, some have dominated. Attitude theory has enjoyed sustained popularity over several decades. During the early 1970s, hardly an issue of the *Journal of Consumer Research*, *Journal of Marketing*, or *Journal of Marketing Research* appeared without at least one (and often more than one) article making heavy use of Fishbein's seminal work (Fishbein and Ajzen, 1975). In the late 1980s, attention shifted to other attitude theories (Chaiken, 1980; Petty and Cacioppo, 1986), and since then the dominance of attitude theory appears to have waned a bit.

In the early 1970s, research on various aspects of cognitive processes (including judgment and decision making) surfaced, quickly becoming a dominant intellectual focus in the field. In recent years, the focus has centered on understanding the effects of rapid and automatic or System I processing vs more

deliberate and careful, or System II processing on decision-making behavior. For a review see Evans (2008). This framework posits that the default approach to cognitive processing is one based on minimal cognitive effort in order to conserve limited cognitive resources. As such, System 1 processing tends to be nonconscious, automatic, and more affectively charged. When sufficiently motivated and able, a consumer will instead engage in more effortful cognitive processing efforts, using reason and conscious awareness of attitudes to make decisions. Such System 2 processing is conceived of as being slower, more reason based, and less emotion driven (Kahneman, 2003). Importantly, decision outcomes can vary as a function of which type of processing is engaged. Similar dual processing models were earlier evident in theories of attitude formation and change (Chaiken, 1980; Petty and Cacioppo, 1986). The dual processing approach is now much more broadly applied to various aspects of decision making however.

In recent years, a greater focus has shifted to the effect of nonconscious and noncognitive processes, moving the discipline further away from the Economic Man model. For example, the impact that bodily movements and sensory experiences have on consumer responses (Krishna, 2012) has attracted significant research attention, reflecting the influence of theories of embodied cognition and other 'feelings as information' approaches (e.g., Hong and Sun, 2012). Studies have shown, for example, that motor activity, muscle contractions, and other physical sensations can significantly influence consumer inferences and response patterns (Labroo and Nielsen, 2010). Firming one's muscles can enhance a consumer's willpower; increase their ability to withstand pain and to avoid tempting foods (Hung and Labroo, 2011). Feeling physically cold increases the liking of romance movies due to the activation of the need for social warmth (Hong and Sun, 2012). Researchers have begun to investigate the effects of each of the five senses on consumer behavior, especially those of olfaction, touch, and taste that had previously been largely ignored. It has been shown, for example, that the quality of the cup from which water is tasted can influence the perceived taste of the water (Krishna and Morrin, 2008), and that consumers differ in the degree to which they enjoy and need to touch products before purchasing them (Peck and Childers, 2003). Recognizing the growing interest in these areas, a special issue of the *Journal of Consumer Psychology* was devoted to sensory perception, embodiment, and grounded cognition (forthcoming 2014 issue edited by Aradhna Krishna and Norbert Schwarz).

Another thrust has been increasing attention devoted to how consumer research may be used to develop, evaluate, and influence public policy. While research of this sort appears in the journals noted above, much is now published in the *Journal of Public Policy and Marketing* (www.marketingpower.com), a journal established for this purpose *c*.1980.

The field has experienced shifts in research methodology. Early nonpsychological research placed great reliance on surveys. As psychological factors assumed greater prominence in the field's models, experimentation became the dominant methodological approach. Since the 1990s, there has been a gradual acceptance of qualitative research methods of various sorts (ethnographic, interpretivistic, introspective, etc.), but these approaches account for a relatively small proportion of published works. We estimate that less than 15–20% of the currently published work utilizes such methods. Recently, prominent consumer researchers have advocated for a renewed appreciation of research that reports novel empirical findings, in addition to the traditional focus on incremental, theory-based approaches to science (Alba, 2012; Park, 2012). Park (2012) refers to this distinction as one of 'cute' vs 'beautiful' research, arguing that the field of consumer research should embrace both. Such calls may be partly in response to the ever increasing number of studies typically required within a single article for publication at a top tier journal as well as the increased emphasis on the use of sophisticated statistical techniques to demonstrate process mechanisms such as mediation analysis via bootstrapping approaches and more complex variants such as moderated mediation (e.g., Preacher et al., 2007).

Emerging Foci in Consumer Research

In addition to the emphases mentioned above, others that can be anticipated include the following. First, though we do not expect many to forsake reliance on static verbal report methods, it is expected that consumer researchers will gradually display greater use of qualitative and quantitative methods that capture the dynamic nature of the behavior and underlying processes. Such approaches are aided by the availability of web-based surveys, consumer panels, mobile devices such as smartphones, computer software, and other technologies that can capture geographic location, vocal responses, track eye gaze paths, and monitor brain activation patterns in response to marketing stimuli – also known as neuromarketing (Plassman et al., 2012; Yoon et al., 2012b). The integration of social media into study designs as an effective way to track and possibly even alter consumer behavior will likely be seen in coming years.

Second, while some work has always focused on socially important issues and improving social welfare, we expect to see an increase in such research. Related to this trend is an increasing focus on consumer research that has the capacity to change consumers' lives for the better, often referred to as Transformative Consumer Research. This stream of research includes issues related to enhancing consumer well-being (Molinger et al., 2012), corporate social responsibility (Torelli et al., 2012), and environmental sustainability. This stream is also devoted to exploring issues associated with 'at risk' consumer populations such as the poor, the elderly, the disabled, the illiterate, and other relatively underresearched demographic groups. Hill and Stamey (1990) looked at the ways the homeless acquire possessions and how these are used to aid their survival, for example.

Researchers have turned their attention to globally pressing issues such as the obesity epidemic, for example, by examining goal theory, self-control, and approach-avoidance response (e.g., Yoon et al., 2012a). The way that consumers resolve goal conflicts, such as the desire to enjoy chocolate cake in the immediate future vs the desire to maintain a healthy body weight in the long term, has captured the interest of several consumer researchers. Construal level theory has been used to help explain inconsistencies in preferences as a function of how abstractly or concretely events are construed. Events

thought of as psychologically distant and more abstract, such as those occurring in the distant future, have been found to be more driven by long-term goals, whereas those thought of as psychologically near and concrete, such as those occurring in the near future, will be driven by short-term goals (Eyal et al., 2009). Ego-depletion theory (Baumeister, 2002), which suggests that the consumer's ability to exert self-control is limited much like a muscle that is depleted with use, has dominated much of the effort to understand issues related to self-regulatory behavior as well. Theories regarding how the exercise of self-control subsequently licenses the lack of self-regulation are also relevant in this domain (Khan and Dhar, 2006). These theories have also been used to examine issues such as financial investing, use of credit, and gambling.

Third, we expect consumer researchers to be drawn into applying their expertise in a number of other realms. Such a trend has been emerging in the legal arena, particularly in regard to deceptive advertising, trademark confusion, and product liability, where psychological theory and research are playing an increasing role (Jacoby, 2001). Such extensions can be expected to occur in regard to social media, consumer privacy, and in other unanticipated arenas as well.

Last, as noted, the ACR is widely acknowledged to be the central organization for consumer researchers of any stripe. However, unlike the Society for Consumer Psychology (which subscribes to the American Psychological Association's Code of Ethics), the governance of ACR has resisted most efforts to develop and implement any such code. For the good of that organization, one hopes this will change, preferably sooner rather than later. See Alberts and Shine, 1994, "Because questionable research practices are generally not appropriate targets for governmental or legal investigations, the scientific community itself must take responsibility for determining which practices are serious enough to warrant institutional or professional responses and what forms these responses should take…. The responsibility for scientific conduct falls on all parts of the research community, including…the leaders of scientific societies" Alberts and Shine (1994: p. 1660). At the time they wrote this article, Alberts and Shine were, respectively, President of the National Academy of Sciences and President of the National Institutes of Medicine. The need for a code of conduct seems especially acute in light of recent article retractions, such as that by the *Journal of Consumer Research* due to the use of fraudulent data (Retraction, *JCR* 2012: p. 444).

Abstract

Scholarship on the geography of consumption is strongly focused on the consequences of consumption. These consequences can be mapped through three spatial registers: the body, consuming connections, and the globalization of consumption. This article reviews academic scholarship on the consequences of consumption through these three spatial registers and draws connections between them.

Introduction

It is almost 20 years since the publication of Nicky Gregson's (1995) paper *And now it's all consumption*? Gregson was writing about a growing interest within geography and the broader social sciences on consumption. Consumption, she argued, had become 'a major concern' for social scientists and a subject worthy of study in its own right. If Gregson were to write a follow up article now, she might be tempted to use the title *It's still consumption!*, for research and writing on consumption within geography and the social sciences continues unabated. The interest in consumption geographies justifies the publication of many overview papers of the field and a growing number of book-length contributions on the issue of consumption. There is also no limit to the public interest in reading about the 'dark side' of consumption with new popular books like *Excess*, *Crass Consumption*, and *Wasted World* providing readers with new stories about ills of over-consumption. It seems there is no limit to the academic and popular appetite for writing on consumption.

In her review of consumption in the mid-1990s, Gregson (1995) examined two central themes in the field: the mall as a key site for consumption and the promotion of consumer goods through advertising. In contemporary writing on consumption, the spaces and sites of consumption remain important areas of debate and analysis. Similarly, there has been ongoing work on the role of advertising. Yet, the key concern for social scientists writing about the geographies of consumption has shifted considerably since the mid-1990s. And this shift is perhaps best captured by the title of Daniel Miller's (2012) recent book *Consumption and its Consequences.* More than any other issue, it is the *effect* of our consumption practices that has become the central question in the debates on the geographies of consumption. Writing on consumption has focused on what our consumption practices do to our bodies, what effect they have on the natural environment, and how they are implicated in global inequality. And we are being urged to change our consumption practices in ways that improves personal health, protects the environment, and addresses the challenge of global uneven development and poverty.

The problem, of course, is that it is very difficult to assess the consequences of individual acts of consumption. Even when it comes to the body, it is not altogether clear what effect the consumption of food and other materials has on the body. Take, for example, Becky Mansfield's (2011) extraordinary analysis of farmed and wild fish, which are simultaneously nutritious food and harmful poison. When it comes to larger scale questions like the relationship between consumption habits and climate change, the links are even more opaque. Paradoxically, perhaps, the difficulty in tracing the connections between consumption practices and their effects has not dampened popular and academic interest in the consequences of consumption.

In this article of research on consumption geographies, I explore the various ways in which geographers and other social scientists are writing about consumption and its consequences. I do this by examining the effects of consumption in three spatial registers: the consuming body, consuming connections, and the global spread of consumption. While the issue of consuming connections – in the form of ethical consumption – is a frequent theme in reviews of the field of consumption geographies, the themes of the consuming body and the globalization of consumption are less often considered in overviews of the field. In this way, this article on the geography of consumption presents some novel material and potentially new and interesting directions for research. The article begins with the globalization of consumption, the consequences of which are receiving increasing attention.

Globalizing Consumption

Research on consumption focuses almost exclusively on North America and the United Kingdom (Trentmann, 2009). Yet, the situation is changing rapidly in the context of the rapid spread of consumerism beyond Anglo-America. The globalization of consumption is linked to the rise of a new 'global middle class,' a class defined not by its relation to production, but by how it consumes. This is a class of consumers that has enough disposable income to afford cars, homes, televisions, and other commodities normally associated with a middle-class lifestyle in the United States and parts of Europe. Perhaps, not surprisingly, the consequences of the globalization of consumption are being interpreted in dramatically different ways.

For economic organizations concerned with global economic growth, like the Organisation for Economic Co-operation and Development (OECD), this new middle class has the potential to reinvigorate the global economy in the

 http://dx.doi.org/10.1016/B978-0-08-097086-8.72110-6

wake of the global economic meltdown after 2008. Significantly, the new middle class has the potential to fill the "void in global demand brought on by the retrenchment of the American consumer" (Kharas, 2010: 8). The new driver of the global economy, it seems, is moving east: "the underlying structural forces for global growth may be able to reassert themselves and usher in a new era of rapid progress, this time based on an Asian middle class" (Kharas, 2010: 39). The OECD is not the only organization hopeful that the new global middle class will resuscitate global economic growth. In January 2013, the *Economist* reported on several new studies emphasizing the significance of the new middle class for global growth. One of these reports has estimated the enormous size of this new market – 'the $10 trillion prize' – and the challenges of marketing products for 'nontraditional' consumers. In China, for instance, marketers are encouraged to pay heed to the importance of aspiration in families that often have only one child. Ronald McDonald in China is not a clown, but is instead 'Professor McDonald' who offers courses in writing and mathematics to consuming children.

For environmentalists, the spread of 'Western' consumer habits to countries like India and China represents an environmental calamity. And they have, for some time, warned about the potential environmental impact of spreading consumer culture to Asian countries. The World Watch Institute, for example, warned in 2004 that the planet could not afford so many people wanting access to household appliances, consumer goods, and increased mobility. To be fair to the World Watch Institute, it is equally concerned about the unsustainability of consumption in North America and Europe. The problem in countries like China and India, however, has to do with the size of the population and the argument that relatively small incomes in these countries leads to environmentally damaging consumption levels: "even at income levels that most observers would think of as subsistence – about $5000 – $6000 per person per year – people are already consuming at unsustainable levels" (Assadourian, 2010: 7).

Academic writing on consumption in countries where the global middle class is growing is beginning to provide more complexity to the stark difference between consumption as 'savior of the global economy' and consumption as 'environmental calamity.' This writing has explored the rise of a new class of consumer citizens, and the meanings and politics associated with new consumption practices. In China, the rise of a new class of consumers emerged after the death of Chairman Mao, and the period of market reforms that began in the 1980s. Consumption in China since then has been spurred by rapid economic growth as well as state policies that have, at times, encouraged spending rather than saving to stimulate economic growth and reduce the country's trade surplus.

Although there is some research that sees the rise of personal consumption in places like China and India as hedonistic and dystopic, most scholars have focused on the practices of consumption in these countries (Latham, 2006). An important theme in this work is to avoid seeing consumption as an unproblematic process of mapping global (or US practices) into new geographical contexts. Instead, consumption is viewed as a process that is shaped by situated historical, social, and political processes. The result is a growing body of work that is sensitive to the social and moral continuities and discontinuities between past and contemporary consumption patterns.

There are a number of interesting case studies that have explored the complexity of consumption outside Anglo-America. In her research on the culture of consumption in Korea, for example, Nelson (2006) found a high level of concern over excessive or inappropriate consumption practices. This is a culture that is highly concerned with "what kinds of consumption are appropriate – in terms of individual morality, national character, and mutual responsibility" (Nelson, 2006: 190). Pop singer Psy's wildly popular 'Gangnam style' music video and dance might be interpreted as a cultural reflection of Korea's attitude toward consumption: although it is not widely know, the hit-single is a biting parody of excessive consumption practices in Seoul's Gangnam district.

There are several other studies that have explored consumption in Asia through the analysis of specific commodities. Gong and Jackson (2012), for example, have recently examined the impact of the infant-feeding crisis in China in 2008. Although in one sense, the crisis represents the globalization of 'consumption anxieties,' which are well established in the West, the process in China is shaped by the specific context. Gong and Jackson (2012: 572) stress that consumption anxieties in China must be understood through the practices of an emerging middle class, the prevalence of one-child families, changes in interfamily relations, and the 'discourses of science and tradition' related to food consumption in general, and infant formula, in particular.

Talukdar's (2012) study of how women in India are consuming the 'ideal' skinny body shape imported from the West and promoted through advertisements for clothes and food provides an additional case of how globalized consumption practices are reshaped in local context. She argues that urban women in India have been able to "create individualised, personal experiences with their bodies and food while not disrupting familial and communal beliefs of eating and the body" (Talukdar's, 2012: 116).

A final example is Wiley's (2011) study of milk consumption in three countries – India, China, and the United States – which provides a fascinating example of how a single commodity means different things in different places. Although the globalization of milk consumption is associated with its positive relationship to growth (both personal and economic), the meaning of milk in China and India is shaped by cultural practices and political histories. In China, milk is seen as a "quintessential modern Western drink, identified with politically and economically strong nations," but in India, the meaning of milk must be negotiated in a context where the commodity is associated with both sacred cows and impure water buffalo (Wiley, 2010: 28).

What are the consequences of rising consumption of the global middle class? While there is a growing body of work on the impact of consumption in China and India on marine and terrestrial environments in other parts of the world (especially fish and timber), research on changing global value chains (GVC) is providing some unique insights on the impact of the changing geography of global consumption (Kaplinksy and Farooki, 2010). The GVC framework has been used since the early 1990s to analyze south to north GVC, and there is now

a very large body of work on this topic. A key finding of this research has been the role that Western markets have played in shaping production in southern countries through chains that are described as 'buyer driven.' Buyers in the north have shaped production in the south through their specific demands for quality and product standards. This has meant that in order to participate in global markets, southern producers have had to increase their capacity – or 'upgrade' – to meet the demands of northern buyers. In addition, southern producers have been required to adhere to a growing set of ethical and environmental standards. The key point is that export production in the south has been shaped by the specific demands of Western buyers.

The consequences of the shift of global supply chains from west to east are potentially profound for southern producers. It may lead to increased demand for commodities from southern exporters. But the nature of this demand is likely to change in a context where consumers are more interested in lower prices than they are in quality and product standards. In this way, it would reverse the trend of product and process upgrading that has characterized GVC in the recent past. The distinctive nature of 'Asian consumption' may also mean that these producers will be under less pressure to meet ethical and environmental standards (Kaplinksky et al., 2011). This research suggests that the changing global map of consumption will have a significant impact on producers, particularly those in the south used to supplying northern markets.

Consuming Connections

The growth of ethical consumption in the last 30 years has been extraordinary. Barnett et al. (2011) found that the consumption of ethical products in the UK increased from £13.5 billion in 1999 to £36 billion in 2009. Although these volumes are small relative to total sales of consumer goods, the sale of ethically traded products has been increasing at a rapid and consistent rate for several decades. The ethical label that continues to draw the most attention is Fairtrade. It is by far the longest-lived ethical consumption initiative and consumption figures been growing rapidly and consistently over more than three decades. Fairtrade products sold globally reached £4.3 billion in 2010, up by 27% from the previous year.

The production of academic writing on ethical trade seems to have kept pace with its growth in consumer markets. A key focus has been on the Fairtrade label, but research has also traced the emergence of a wide range of ethical labels that promise fair treatment of producers and workers, and environmental stewardship. Research has also explored new corporate-driven initiatives including 'consumer related marketing,' where the purchase of a commodity leads to a social investment somewhere in the developing world.

There are two central themes in the literature on ethical consumption. The first is the question of *mainstreaming*, which refers to the process through which corporate interests are appropriating alternative trading networks. Although corporate interests were until recently opposed to fair trade markets, the situation has changed considerably since the 1990s with large multinationals now selling fair trade certified products. Laura Raynolds (2009) has provided key insights into the process of mainstreaming through her work on coffee. She has argued that the Fairtrade market for coffee has fragmented into subchains that are more or less committed to the original goals of the movement. 'Mission-driven' companies maintain a strong commitment to the original principles of fair trade, and use the certification systems associated with Fairtrade to promote the sale of their products. The organizations identified as 'mission driven' do little retailing and most only sell products that carry the Fairtrade label. 'Quality-driven' firms, on the other hand, have become more institutionalized in the sense that their adherence to the fair trade certification system has more to do with how coffee and other commodities are sourced rather than on the values associated with the label. In other words, these companies have become involved with Fairtrade because of how these chains are coordinated, rather than by the goals of Fairtrade. 'Market-driven' companies represent the third group of firms associated with Fairtrade coffee. As Raynolds (2009: 1088) argues, this is the "largest and fastest growing share of Fair Trade certified coffee," and these companies have "little if any allegiance to Fair Trade's mission." The companies grouped under this category include multinationals like Nestle and Proctor and Gamble, as well as well-known retail and sales outlets like Starbucks.

Raynolds' analysis points to a fragmentation of Fair Trade value chains, with different levels of commitment to the original goals of the movement. Dolan (2010) and Goodman (2010) have provided a starker view of the effect of mainstreaming on the Fair Trade market, with equally bleak prospects for consumers wanting to make a difference. Dolan's findings are based on research conducted in Kenya's fair trade tea industry. There she found that the goals of fair trade are being undermined through practices of labeling and certification, which have become "surrogates for trust, dialogue and social ties" (Dolan, 2010: 38). In other words, the mechanisms associated with Fairtrade certification, including auditing and monitoring, are at odds with the social and developmental goals associated with fair trade. Dolan's argument, then, is that fair trade has become thoroughly institutionalized: besides "the social premium, there is absolutely no difference between the structures of the conventional tea trade and that of Fairtrade" (Dolan, 2010: 37).

Michael Goodman (2010) has provided an insightful analysis of the problem facing fair trade. Multinational corporations and global retail chains have played an increasingly important role in fair trade markets and have been largely responsible for recent increases in the volume of fairly traded goods. In one sense, this should be seen in a positive light: the more goods that are traded fairly, the greater the impact in the developing world. These increases might also be understood as supporting the positive role that ethical-minded consumers are having over capitalist markets. Goodman's argument, however, is that while the 'ends' of fair trade are being met, they are increasingly being achieved through 'means' that are not consistent with the goals and principles of fair trade. He writes: "in the desire to develop more collective politicized subjects in the consumers of fair trade and Northern consumers more generally, it really is the *means that matter* just as much as the ends when considering the specific practices and processes of how, why and by whom fair trade gets done" (Goodman, 2010: 115).

A second theme in the literature on ethical consumption concerns the politics and morals associated with a system that uses personal consumption choices as a driver of social development goals. Goodman is again an important critical voice in this theme: he argues that consumer choices in 'developmental consumption' commodity chains have become critical in determining whether development happens, and who gets receives this development. In this new era, "sustainable development can now and truly be store bought" (Goodman, 2010: 105). Goodman is not alone in raising concerns about how individual acts of consumption have become central to poverty alleviation. Rebecca Hawkins (2012) has written about several cause-related marketing (CRM) programs, which encourage consumers to purchase commodities that lead to different forms of social investment in the developing world. She is also concerned with how individual acts of consumption are marketed to consumers as potential solutions to complex development challenges in the south. The significance of Hawkins' work is that it is not the anonymous individual consumer that is important in her cases of CRM. Instead, it is women consumers who are targeted as key players in promoting a 'global motherhood' that connects caring mothers in the north with their needy counterparts in the south. The problem with this framing is that it limits "the possibilities for meaningful and respectful connections and political collaborations between women and more generally between distant people and places" (Hawkins, 2012: 757).

The politics of personal consumption are also evident in research on Bono's Product (RED) campaign, a program that Richey and Ponte (2008) have explored in considerable detail. The campaign brings together multinational corporations, celebrities, and fashion-conscious consumers to support Africans living with HIV/AIDS. The consumption of high-profile brands (e.g., Apple, Dell, Converse, Microsoft) by 'consumer citizens' in the north is used to support the campaign against HIV/AIDS in Africa. In this way, consumers can be both 'chic' and caring in their consumption choices. The problem for Richey and Ponte (2008) is that these campaigns focus attention on solving the manifestations of poverty and inequality – which can be solved through individual acts of 'low-cost heroism' – rather than the underlying causes of the problem located in unequal trade relations and exploitative labor practices. In this way, the attention is on "the welfare of Africans with AIDS in general, not of workers in factories producing RED products" (Richey and Ponte, 2008: 313).

An important theme in the writing on ethical trade is how it frames consumers as saviors of development and producers in the south as needy beneficiaries. This is a central theme in Le Billon's (2006) research on a campaign that has aimed at reforming the trade in conflict diamonds. While he is able to show that the efforts to reform the diamond trade had a positive effect, consumer action was mobilized through narratives of extreme violence and greed in diamond-producing countries. The effect of these narratives was to entrench the idea that "violence was a purely criminal enterprise driven by 'greed,' or a senseless attack on 'freedom,' rather than the outcome of exploitative and exclusionary histories of and uneven development" (Le Billon, 2006: 778).

Barnett and his colleagues have provided an important counterargument to the negative views of ethical consumption through a series of papers and, most recently, through a monograph (Barnett et al., 2011). They argue against the common view that "consumption activities are a sign of the substitution of privatized acts of consumer choice for properly political forms of collective action" (Barnett et al., 2011: one). Rather than seeing consumer choice as linked to the entrenchment of a neoliberal consuming subject, they argue that ethical consumption reflects new forms of political mobilization and civic involvement. Barnett et al.'s (2011) view is an important one in that it attempts to decenter the consuming subject in debates on ethical consumption, but it seems to be overshadowed by a growing literature on fair trade that is increasingly pessimistic about its potential to reform global trade and address underdevelopment and poverty (Moberg and Lyon, 2010).

The Consuming Body

The consequence of food consumption on the human body is the third spatial register considered in this article. It has become a key issue of policy debate and media attention, and it is most often articulated as a crisis associated with weight gain and, more seriously, obesity. The body mass index (BMI) is the ostensibly objective measure used to map and monitor over time the changing cartography of obesity. Predictably, these maps show that the problem is most severe in the United States where BMI rates have increased dramatically in the last 30 years. A recent report on the situation in the United States entitled *F is for Fat: How Obesity Threatens America's Future* found that adult obesity rates had doubled between 1980 and 2010. The report warns that unless something is done to reduce BMI trends, obesity rates could be as high as 44% in all US states, and as high as 60% in 13 states. The consequences of overconsumption and weight gain in the United States and elsewhere are usually framed in terms of personal health problems. Obesity is frequently cited as a cause of other serious health conditions including diabetes and heart disease. However, reports on obesity also warn of broader societal consequences including the impact on military preparedness and its effect on worker productivity (Guthman and DuPuis, 2006).

In the United Kingdom, obesity is viewed as an epidemic that is spreading from the United States with potentially dire consequences. Mepham (2010: 17), for example, has warned that the "impending epidemic of obesity in the UK is predicted to present a challenge comparable to that of global warming." His argument may have been based on a study conducted by the London School of Hygiene and Tropical medicine suggesting that fat people contribute more to global warming than thin people (cited in Guthman, 2012). As is the case in the United States, the impact of obesity in the United Kingdom is more than a personal problem. Mepham (2010) predicts that the costs of obesity to the UK's National Health Service will be as high as £10 billion by 2050. One of the notable responses to this 'impending crisis' in the UK has been to focus efforts on changing consumption habits of children. To this end, the UK has been conducting controversial programs to monitor the BMI of children at school.

Geographers have been relatively slow in developing a critical tradition of work on weight and obesity. Writing in the

mid-1990s, Rebecca Longhurst (1995: 252) argued that the widespread belief that 'people are voluntarily fat' was one of the reasons why geographers were not yet contributing to critical social science writing on obesity. She suggested that it "was time to write body shape *geographically*," and called for critical work on the diet industry, eating disorders, fat oppression, and the relationship between size and class (Longhurst, 2005: 247). Since then, a small but vibrant tradition of research has emerged on obesity that has explored a range of issues related to the discourse of obesity, social identity, and the spaces of consumption. The effort has included two special issues in the radical geography journal *Antipode*, and a new landmark book-length contribution by Julie Guthman (2012).

It is possible to identify several key themes in this article on the consuming body. The first has questioned the discourse of obesity and the problem of the 'obese subject.' Fundamental to contemporary debates on obesity is the Cartesian separation of body and mind. The issue is how, but more importantly, whether the mind is able to control the irrational urges of the body. In this way, bodies are "conceptualised as unruly, dangerous and in need of control" (Evans, 2006: 262). The emphasis on control and rationality has meant that individuals who become fat or obese, because they are unable to control their 'unruly bodies,' are seen as weak willed. Obesity and weight gain is therefore regarded as both a personal responsibility and a moral failing, and has led to marginalization of people who are considered to be overweight. Rawlins (2008: 146) shows that the problem of an obese subject goes beyond the personal: in the UK the "conception of a good citizen is an individual who looks after their own body not merely for their own sake, but for the good of the nation as a whole." As is the case in the United States, the consequences of the obesity crisis is in the United Kingdom are at the scale of the nation-state.

Social science writing on weight and obesity has been highly critical of the discourse of the 'obese subject' linking it other forms of social marginalization (e.g., racism). But it has done more: for example, researchers have raised serious questions about the taken-for-granted links between weight gain and heart disease or diabetes. The relationship between weight and health is complex, and public health policy often confuses cause with effect (Colls and Evans, 2009; Guthman, 2012).

Geographers have provided an important contribution to research on the 'obese subject' by exploring how individuals who are anxious about their weight negotiate consumption spaces. Hopkins' (2012) survey of a group of people who self-identify as fat or obese provides insights into how these individuals negotiate the discourse of obesity in everyday-consumption practices. Space and the relations between his informants and other people are critical to his analysis. In consumption spaces where Hopkins' informants felt uncomfortable, they would actively modify their behavior by limiting the amount of food or drink they consumed to demonstrate control over their 'bodily urges' and to show that they were actively trying to lose weight. In addition, they reported choosing clothes that they hoped would make them look thinner, and were careful to sit in places that they hoped would conceal their bodies from judgment. Hopkins's research provides an important example of how the discourse of obesity is negotiated in different consumption spaces and in the relations between individuals and groups.

Longhurst's (2012) extraordinarily candid and personal autobiography of weight loss provides a unique insight into the complex relationship between the consuming body, identity, and space. As a feminist scholar who has been at the forefront of critical debates on obesity, she reflects on her experience of losing weight and becoming thinner. In some ways, her experience is not dissimilar to what has been reported by individuals who have been the subject of research on obesity. As an overweight individual, she felt judged and uncomfortable in consumption spaces like restaurants, clothing stores, and galleries. And when she did lose weight, and others commented on her success, she felt that her "fierce determination, body vigilance and will power had been worthwhile" (Longhurst, 2012: 881). With a smaller body, she found it easier to negotiate in and through spaces of consumption. Yet, her efforts went against feminist writing on obesity that problematizes the issue of weight and the obese subject. In losing weight, Longhurst had to negotiate the challenge of dealing with colleagues and students who had felt she had somehow 'sold out' by becoming thin. As Longhurst (2012: 879) writes, the "spaces of weight loss are undoubtedly complex, fluid, contradictory and paradoxical."

A second theme within on the consuming body has focused on how the problem of obesity is known and measured. Given the significance of the BMI index in assessing weight gain, research has focused on how it is implicated in the performance of an obesity epidemic. The popularity and widespread use of the BMI is linked in part to its simplicity: it is a straightforward ratio of height and weight. This simplicity also means that individuals can self-report their BMI 'number' and assess it against the scale of thinness and obesity. In this way, BMI has become a means for individuals to self-regulate their consumption practices against an ostensibly objective scale.

The problem with BMI is that it is not an accurate measure of fat on the body, as it cannot distinguish between muscle, bones, and fatty tissue. The result is that individuals with large and highly muscled bodies are likely to have high BMI scores even though their body fat is relatively low. An additional problem with the BMI measure is that very small changes in BMI in a population can lead to significant changes in the proportion of the population measured as overweight or obese. This is because the BMI scale has hard and fast divisions between weight categories. The arbitrariness of the scale was revealed in 1999 when the scale for overweight was reduced from 29 to 25, which effectively increased the number of people in this category overnight. Finally, the BMI is not sensitive to gender and ethnic differences (Guthman, 2012), which skew the results.

Evans and Colls (2009) have contributed significantly to a critical understanding of BMI through their analysis of its use in the United Kingdom. In response to a perceived future obesity epidemic, the UK's Department of Health initiated a survey of children's BMI in schools in 2006. Evans and Colls explore how the measurement of BMI is implicated in processes of biopower with children's bodies becoming the object of regulation and discipline. Their analysis raises questions about the BMI as an "abstracted representation of the body" and reveals how the index has been used as a "biopolitical strategy which both regularises and disciplines bodies at a population and individual level" (Evans and Colls, 2009: 1053).

Julie Guthman's (2012) most recent book on obesity – *Weighin In* – represents a key contribution to research on the consuming body. It is difficult to do justice to this outstanding book in a short review, but it is, nonetheless, possible to outline the broad contours of her argument. Guthman draws on a rich tradition of research in critical political ecology to challenge existing approaches to obesity that focus on personal choice, and which medicalize and pathologize obesity. Central to her argument is the idea that the body has become a 'spatial fix' for the contradictions of neoliberal capitalism in the United States. In this way, obesity is not the result of poor personal choices, but is instead a consequence of neoliberal policies that have led to growing inequality and a larger class of people subsisting on marginal incomes. The food system, largely unregulated yet supported by a heavily subsidized agricultural economy, provides easy access to cheap food that is more fattening than it is nutritious. Neoliberal policies have also shaped the built environment and retail spaces in ways that encourage weight gain and obesity.

If the cause of obesity in the United States is the neoliberal food economy, then the solution cannot involve changing personal choices or developing alternative food markets. Instead, Guthman urges a focus on the political policies that have fixed the contradictions of neoliberalism in the (US) body. Guthman's important intervention provides an overarching analysis of the problem of obesity especially in the United States, with potential relevance to other countries affected by neoliberalism. In this way, her analysis decenters personal consumption habits, and the issue of choice and control, to suggest that weight gain and obesity should be understood in the broader political ecology.

Conclusion

This article of academic scholarship and popular writing on geographies of consumption has focused on the consequences of consumption at three spatial registers: the consuming body, consuming connections, and the globalization of consumption. Academic scholarship in these fields has provided critical insights into the consequences of consumption especially as they relate to questions of obesity, ethical and fair trade, and global consumption patterns. Although three spatial registers were discussed separately, there are important links between them. For example, the globalization of consumption is leading to what health experts are calling a 'nutrition transition.' This nutrition transition is regarded as the key reasons behind the spread of a 'pandemic of obesity' around the planet. In this way, the globalization of consumption and obesity are not separate processes, and demand the attention of geographers and other social scientists who have provided critical analysis of obesity in Western contexts. Similarly, there are links between consuming connections and the globalization of consumption. Academic writing on fair trade is increasingly concerned with how it is becoming mainstream, but a potentially more pressing question relates to whether the new global middle class in Asia and elsewhere will be attracted by ethical forms of consumption. This connection begs the question: what are the consequences for fair trade as global consumption moves from west to east?

There is a second way in which the three spatial registers are linked together. Scholarship on the geographies of consumption seems to be distancing itself from issues of personal choice in consumption practices. Instead, the emphasis is on balancing research on consumption practices with an analysis of the broader social and political processes that shape consumption and its consequences. This is especially evident in geographical writing on obesity, but it is also evident in writing on ethical consumption practices that attempts to displace the consumer from the central focus of study (e.g., Barnett et al., 2011). In shifting away from consumer choice, writing on the consequences of consumption also leads us inevitably, and appropriately, to questions of production, in the analysis of the consuming body, consuming connections, and the globalization of consumption.

Abstract

The history of consumption has flourished over the last 30 years, interweaving traditional historical methodologies with features from a range of scientific disciplines. Its interests have developed along a chronological arc stretching from the Renaissance to contemporary phenomena of globalization, in search of the deep social, political, and cultural meanings that various forms of society have over time assigned to the material culture.

Definition

Consumption is an integral part of human behavior, so forms a key piece in the overall historical jigsaw. However, it was not until the 1980s that the culture and practice of consumption and the consumer as an important player in the drama became specific subjects of analysis. This relatively late arrival on the scene reflects a concentration on production, and is now both the strength and weakness of this research field, which has proved to be exceptionally dynamic, yielding outstanding results. On the one hand, research has exploited cross-cultural results, adopted interdisciplinary approaches, and differentiated its sources of inquiry. On the other hand, though, it has shown a degree of heterogeneity and sometimes a lack of theoretical background. Over the last 30 years work on the story of consumption has undergone exponential growth, often in the form of a proliferation of specialized subfields (food, material culture, fashion and design, the home, mass media and communications, gender, etc.) rather than a unified narrative covering a particular period – although several works have attempted a synthesis. The element that links the many research initiatives is an awareness that we are dealing with a primary aspect of historical reconstruction, a cultural process embedded in the social, economic, and political background. This process has its own dynamics and involves a large number of actors. The word 'consumption' derives from the Latin *consumere*, to waste, to eat, and its history is basically the story of the relationships between the members of a historically defined society and their material culture, in all meanings of the word.

Intellectual Background and Theories

As stated above, the history of consumption has encouraged the adoption of an interdisciplinary viewpoint, involving a variety of theories and intellectual backgrounds. These are the driving force behind research into sources, interpretations, and historical writings.

The theories of consumption that developed in modern times are rooted in the crucial period at the end of the ancien régime around the seventeenth century, a period that marked the end of a consumer pattern that directly reflected the hierarchical division of classes through sumptuary laws. These laws regulated the quality and quantity of usable goods, especially clothing, on the basis of class, profession, and gender, indirectly reinforcing the social status quo, as Alan Hunt has shown. In fact, what was at issue here was 'luxury' rather than 'consumption', and luxury was usually condemned in religious and moral terms.

It was Bernard Mandeville with *The Fable of Bees* (1714) who overtly contested the positions held at the time, suggesting that private vices – aspirations to luxury – were a seamless complement to public virtues – the development of commerce and the growth of communal wealth. This cast doubt on the fundamental link between parsimony, morality, and socio-economic growth in nations throughout history. The eighteenth century saw protagonists becoming entrenched in one of two positions. One group continued to stigmatize luxury as a form of inequality – in *The Spirit of the Laws* (1748) Montesquieu condemned luxury in the political structure of a republic, where all citizens are called to work toward the common good, but accepted it under a monarchy, where it would symbolize the inevitable social gulf and encourage the development of trade. Rousseau wrote that only austerity was suitable for a virtuous republic, on the pattern of ancient Sparta. On the contrary, David Hume in his essay *On Refinement of the Arts* (1742) justified luxury in modern society as an engine for the economy, recognizing that its significance was very different in ancient societies, as shown by Christopher J. Berry in his book on the concept of luxury. In his work *The Theory of Moral Sentiments* (1759) Adam Smith assigns a particularly important role to the theory of consumption: the author restates the need to separate moral from economic judgments, emphasizing that individual egoism and the new market mechanisms could coexist with luxury and social inequality, damping down the 'revolutionary' effect that the spread of luxury seemed to be having in the societies of the time.

Throughout the nineteenth century and on into the early twentieth century, the process of industrialization in Western societies produced many important effects, above all a focus on the economic and statistical aspects signaling a change in consumer patterns at all social levels. Alongside the references to consumption in the works of the most famous economists – David Ricardo, Alfred Marshall, Léon Walras, and finally Karl Marx, with his distinction between value of use and value of exchange of goods – we should spotlight two great scholars, Le Play and Halbwachs. Frédéric Le Play was a pioneer in research

into family budgets, showing the contribution of statistical instruments to the growth of knowledge in this field, shifting the center of gravity of research from single individuals to families as a fundamental unit of consumption. In 1913 Maurice Halbwachs developed an influential theory that contested 'Engel's law', where family consumption increased in direct proportion to wealth (from basic consumption of goods like food to more sophisticated outlets for wealth like culture, well-being, and travel). By introducing elements of social and cultural analysis he showed that at equal income levels, cultural elements could radically alter consumption patterns – for example, a worker's family and a middle-class family could have a similar income but diverse consumption.

At the same time, Werner Sombart's works, with their background in economy studies, exerted a great deal of influence. He saw luxury as one of the basic differences between the modern capitalist society and societies of the past. Thorstein Veblen was extremely influential in the United States: in his work *The Theory of the Leisure Class* (1899) in particular he analyzed overt displays of consumption by the new affluent classes as a symbolic banner deployed by the new rich to make a public statement of their wealth in a society where old distinctions of birth and class had definitively broken down. 'Conspicuous consumption' became one of the main methods of displaying social status, and came to form a specific feature in the profound economic and social transformation that was taking place in modern capitalist societies.

Many of these theories, especially those with a critical intent, were taken up in the years to come by the analyses of the Frankfurt School, which played a crucial role in examining consumption throughout the mid-twentieth century, from the late 1930s to the 1960s and 1970s. Many works treated the new consumer world, with contributions from high-profile figures like Walter Benjamin, Theodor Adorno, Max Horkheimer, and, later, Herbert Marcuse. However, the work that perhaps had the greatest impact was *Dialectic of Enlightenment* (1944), where Adorno and Horckheimer, taking a typically Marxian analysis as their starting point, developed a hard-hitting critique of consumerism, seeing it as the tool of a new form of oppression that acted through the manipulation of desires at every level of society, exercising power in a new way. Everything became a commodity; everything was bought and sold. Culture no longer had a libertarian, critical function, it had been transformed into an industry, becoming a consumable in its turn. In his work *The Society of the Spectacle* (1967), Guy Debord produced a definition that met with great success, identifying the entertainment-consumption tandem as a key to reading contemporary society – from a negative stance, of course.

Although they adopted a more concrete approach with a less negative thrust, theorists from the United States like John Kenneth Galbraith (*The Affluent Society*, 1958), Vance Packard, and David Riesman also highlighted the manipulative mechanisms involved in consumption in contemporary society, in this case linked above all to the activities of large corporations and the mass-media world. However, the late 1970s saw the development of a field of study on consumption that would lay the foundations for a different viewpoint. In particular the cultural studies tradition nurtured at Birmingham by Richard Hoggart and Stuart Hall began to analyze the new youth subcultures that were often expressed through new forms of consumption. These highlighted broad areas of independence and choice among such consumers, regarded for the first time as autonomous subjects, not passive victims of political and commercial manipulation.

Cultural developments in the 1980s led historians of consumption to cast their net even wider, taking in theoretical contributions emerging from the fields of semiotics, sociology, anthropology, and philosophy. One of the most influential thinkers was Roland Barthes, who spoke explicitly of 'mythologies' underlying even the most everyday acts of consumption. These acts became significant in themselves, and were rooted in complex historical contexts. Every object is made up not only of a material form, it is also charged with a 'universe of meanings' and deep cultural connotations that must be decoded. Every object is a sign of language. Jean Baudrillard studied above all the unreal dimension of the world of consumption, underscoring the proliferation of 'simulacra' created for commercial purposes. Drawing on reality as well as contents of the imagination, they eventually replace reality itself. The glamorous world of shopping and entertainment become our existential reference points. The work emanating from sociology departments also had a great impact, with Michel de Certeau and his analysis of the creation of social practices through everyday consumption, while anthropology also made important contributions. In this connection, the two main figures were Mary Douglas and Arjun Appadurai, who assigned a crucial role in communicating our identity to objects and material culture, given their ability to incorporate meanings. Pierre Bourdieu's notion of 'habitus', developed in relation to strategies of social differentiation based on consumption, had a great impact. Finally, work on social dynamics in contemporary society analyzed the creation of collective aggregations through shared consumption patterns, partly through the use of technical software.

Current Knowledge and the Main Achievements

Against this complex intellectual background, in the 1980s the field of consumption eventually emerged as a key paradigm for any understanding of modern society. It is no surprise that the variety and complexity of the intellectual stimuli underpinning this movement encouraged large numbers of heterogeneous contributions.

One of the first problems facing historians was to identify the appropriate periodization. Some identified the Italian Renaissance as the dawn of the consumer society, when a new value was given to the individual and material culture by the court and intellectual circles, creating an unprecedented market for luxury consumer goods and goods for personal use (Goldthwaite, 1993). Many others, however, have seen the seventeenth and eighteenth centuries as marking the birth of consumption in the modern sense. Norbert Elias regarded the development of a court society along the lines of the court of Versailles, which ranged from 'good manners' to appropriate styles of consumption, as a crucial cultural stage in the formation of modern centralized states. Simon Schama, on the other hand, sees the Dutch Golden Age as the most striking example of the spread of a new culture of consumption embodied in everyday life, at the basis of a new mercantile

culture where patterns of consumption interweave with ways of life inside and outside the home, and extend to interpreting gender roles, looking at art and experiencing wealth (Schama, 1987).

For many, though, eighteenth century Britain, and in part colonial America, was the crucible where a profound transformation was forged. Neil McKendrick, John Brewer, and J.H. Plumb have maintained that at this time a large market for goods was created at a national level, and people from various social classes took part in this exchange as 'consumers' (McKendrick et al., 1982). Many other works followed, such as those by John Brewer and Roy Porter, providing a more in-depth analysis of the various aspects of a consumer culture associated with the mercantilization of public life, the increasing availability of consumer goods, the influence of consumption in the structure of the social hierarchy and family and gender roles. This field of study was joined by two other important sectors that grew chronologically at least throughout the nineteenth century, identified by experts as another crucial node because the industrial revolution was now in full swing, a phenomenon underpinning the creation of a mass market. The first sector is associated with the development of new places and spaces for consumption, especially the department stores that began to appear around the mid-nineteenth century in Europe and the United States. Michael B. Miller showed how the ideals of an ascendant bourgeoisie – solidity, size, wealth, and morality – were reflected in the sales and communications practices, and even physical appearance, of a Parisian department store, 'Au Bon Marché' (Miller, 1981). Later works presented the experience of other countries – Heinz Gerhard Haupt, Wolfang König, and Christian Kleinschmidt for Germany for example – and described how these places became public spaces that were also open to females, now constructing their identity as 'modern' bourgeois women, as shown in works by Erika D. Rappaport, Geoffrey Crossick and Serge Jaumain, Elaine S. Abelson, and others. The second field of study, which made perhaps the most important contribution to the history of consumption, is linked to gender and women's history. Often ignored by 'official' social and political history, consumption proved to be central to an understanding of cultural transformations in the role of women inside and outside the home. They could appear outside the home in the places of trade and commerce, but not without moral qualms regarding the consequences of this desire for luxury, which could lead to kleptomania and promiscuity, endangering the virtue of the young department-store assistants. Inside the home this transformation took the form of constructing a form of domesticity embodied in the interiors of a bourgeois home – its furnishings, kitchen, and decor – as shown, for example, by Clive Edwards, Deborah Cohen, and Maxine Berg. The examination of domesticity continued with interesting results throughout the twentieth century, giving rise to pioneering works like those by Ruth Schwartz Cowan on the transformations – or failed transformations – of the role of the housewife, especially after the gradual introduction of domestic appliances (Schwartz Cowan, 1983).

The seminal work carried out by Sidney W. Mintz cast light on another important area (Mintz, 1985). Using a variety of sources, with an emphasis on anthropological works, he showed how the commercialization of sugar in modern times took on a range of meanings. On the one hand it became a turning point in the organization of domestic life and a sign of the rise of the working classes, to whom it was a cheap source of calories and a symbol of social prestige, driven by commercial advertising. On the other hand it was an integral element in the international trade and politics of the British Empire, inclining owners to respond to growing demand for the product by increasing the size of sugar plantations and the numbers of slaves employed on them. In this way consumption became linked to important international policy and trade decisions, and showed how it could drive change by overturning the traditional view that saw consumption as simply a consequence of production. Attracting agreement and criticism alike, Mintz's work was followed by many analyses examining the complex relationship between Europe and its colonies through the circulation of consumer goods. A recent example is David Ciarlo's work on imperial Germany.

In this way the history of consumption shows how goods and their cultural, political, and economic significance lay behind the appearance of little-known phenomena. These included the construction of domesticity, the role of women and sociocultural transformations of the family, as well as the creation of transnational public spaces for social interaction and political transactions. They also fostered the growth of a hedonistic culture with romantic origins within a range of social classes that would exist side by side with the work ethic that Max Weber regarded as the basis of capitalism, as suggested by Colin Campbell. What emerges is a dual significance linked to the development of consumption studies. On the one hand it clarifies aspects of material and everyday life that are often ignored, making an important contribution to knowledge within the field as a whole, while on the other it creates a prism through which we can observe the social dynamics we have already mentioned or particular historical moments, discovering elements that shed new light and provide comprehensive new interpretations.

From this viewpoint the studies on the twentieth-century dictatorships – especially Nazism and Fascism – are extremely interesting. They have emphasized how the propaganda pumped out by these regimes included a degree of attention to the politics of consumption, despite the strident emphasis on war and aggression. The creation of after-work organizations for holidays, sports, or games, intended to integrate the general population within the party structure, developed into a search for consensus and had the indirect effect of institutionalizing an attitude toward consumption and forms of collective amusement, organized by party or government, as described by Hartmut Berghoff, Jonathan S. Wiesen, and others.

This statist model was successfully contested by a model based on individual and family consumption, reaching its purest form in the United States and the 'American dream', the dominant concept in the post–World War II years. There appeared a quantity of studies examining this phenomenon in the US. An example is the work of Gary Cross, who mapped out a historical profile of the crucial importance of consumption, until it finally became an ideology in itself, one that permeated the national culture. This had a two-edged effect: it drove economic development and created unprecedented levels of well-being, but also often led to social fragmentation and decreasing political and social participation (Cross, 2000.

See also the contribution by Regina Lee Blaszczyk on the period 1865–2005). Lisbeth Cohen also traced a political arc from the New Deal to the post–World War II period, describing the gradual transformation of the citizen–consumer into the consumer–citizen. The state gained importance as a provider of basic goods and services, and the search for consensus increasingly involved the guarantee of a certain standard of living (Cohen, 2003). Susan Strasser, Charles McGovern and Matthias Judt, Martin Daunton and Matthew Hilton, Juliet B. Schor and Douglas B. Holt also produced some interesting work along these lines. From a perspective that emphasized the political fallout, many other works identified consumption as an important factor encouraging immigrants to the US to integrate into the society of their new home, highlighting how certain lifestyles, and especially food consumption, were a key to understanding the social dynamics of the country's various ethnic groups, as shown, for example, by Donna R. Gabaccia. Equally interesting studies analyzed the formation of specific ethnic markets, like the Afro-American community, which moved from widespread poverty to a strong economic growth, especially in the second half of the twentieth century, eventually making up a large section of the consumer goods market, and gradually being integrated into the country's overall development (see Robert E. Weems).

Historians have identified the exporting of the American consumer model to Europe in the postwar years as an essential historical watershed for the twentieth century. In an important contribution, Victoria de Grazia maintained that one of the strengths of the American model was its 'soft power' (with reference to the theories of Joseph Nye), promoted through new arenas for consumption like cut-rate stores and supermarkets, the construction of the figure of the modern housewife, the increasing popularity of fast food, the export of a dynamic entertainment industry, and so on. The book was part of a significant field of study that focused on the effect of exporting goods and consumption models between different places, assessing the results of this cultural hybridization with reference to the historical context. Authors like Richard Pells and Rob Kroes made important contributions in this connection. A number of works examine the effects of this phenomenon in Europe – Richard Kuisel on the ambivalent relationship of the French to Americanization, Volker Berghahn on Germany, Reinhold Wagnleitner on Austria, and Emanuela Scarpellini on Italy. Jonathan Zeitlin and Gary Herrigel have also produced interesting work in the field of economic history, examining the impact of American technology and new management techniques on the development of the European economies, while Ruth Oldenziel and Karin Zachmann look at the influence of the American model on the European domestic scenario.

The overall picture emerging from these studies is that in the movement from one cultural reality to another, the significance of objects and attendant social practices undergoes a series of transformations by which they are hybridized and creolized; this can lead to total rejection by or enhancement of indigenous traditions – or even newly invented versions of them – in response to the new models being offered. Research into these cultural transformations can be seen as one of the main contributions of historical research into consumption in recent decades. It spearheads the historical debate on the meaning and scope of the globalization process from the viewpoint of consumption, with all the ensuing positive and negative effects on contemporary societies.

Changes in Focus

There have been a number of new developments in the field over recent years. Generally speaking, there has been an attempt to deal with the 'cultural turn', returning, for example, to 'materiality', as Frank Trentmann suggests, so the focus on cultural aspects has widened to include social, economic, and political upheavals. However, rather than tracing a single line of development, the result is a much broader range of inquiry.

One important aspect to consider is the broader geographical viewpoint and the history of consumption in non-Western countries. Two trajectories emerge – on the one hand there have been shown to exist flourishing traditions in consumption, luxury, trade, and consumption in places that were totally free from Western influence, in both ancient and modern times. On the other, it has been pointed out how frequently contact with the West has stimulated specific positive or negative reactions. A pioneering example is the contribution made by the historical and anthropological work of Jack Goody. In the context of basic food consumption he emphasized the wealth of the traditions of ancient Egypt, imperial Rome and medieval China, examining in particular the indigenous traditions of various African regions (Goody, 1982). Karl Gerth showed the importance of consumption in the development of modern China. Above all, he studied the close link between the appearance of a consumer culture and the spread of nationalism, especially in the early twentieth century, when it marked a form of opposition to foreign invasion (Gerth, 2003). Japan is another interesting case that has attracted increasing attention. Japan, too, is an ancient civilization that experienced quite advanced forms of urbanization in its main centers, Edo, Osaka, and Kyoto, then had to deal with the impact of contact with the West in various stages up to the twentieth century. From the initial assumption that the modern forms of consumer culture essentially emerged following the encounter with Western culture, the emphasis moved on to the analysis of distinctive local features and a reassessment of indigenous characteristics (see Penelope Francks in Berghoff and Spiekermann, 2012). Africa is different for a variety of reasons. Although the trade links between Africa and the West and Asia are rooted deep in the past, few researchers have examined trade and consumption, as the poverty endemic in so many African states, which prevents standards of living reaching the levels enjoyed by the more developed countries, has been seen as militating against the appearance of a consumer culture. For this reason Africa has long been regarded as being dominated by a subsistence economy, becoming simply a source of raw materials to be exported to the rich countries. Recent studies, however, have highlighted the limitations of this viewpoint. First of all, there are huge economic and social disparities within Africa, so it is impossible to make generalizations. Secondly, the relative scarcity of available goods does not prevent the development of a specific 'culture of consumption', with hierarchies of values and original forms. Take, for example, the traditional communal property giving

way more and more to private ownership, or the deep political implications of the everyday objects of consumption associated with the colonizers. Finally, the scarcity of resources itself highlights the role assumed by governments and international agencies in influencing the direction of developments in consumption (Hahn, 2008). Equal interest has recently been shown in other geopolitical areas like Russia and the Eastern European countries, which are moving rapidly toward Western-style consumption patterns, or the Islamic countries with their complex interweaving of politics and religion, a reason why consumption becomes an inherent aspect of the globalization process (Stearns, 2001).

Ecology and the environment are also important themes for historians of consumption. The development of consumer societies across the world has led to pollution and the depletion of available resources, with a rapid increase in the size of humanity's environmental footprint. Consumption is one of the causes of this – as Susan Strasser reminds us, all we have to do is to look at the problem of urban waste and its recycling – even though it is often only a contributory element in studies that focus more closely on ecological problems. It is interesting to note that there appear to be two solutions to ecological crises – measures taken by the authorities, be they governments or NGOs, and changes in consumer behavior, especially following the appearance of a responsible 'green consumer' movement. This leads us to another crucial theme in recent studies on consumption, consumer organizations. Lawrence B. Glickmann tells the full story of consumer movements in the USA, from the first loosely organized boycotts to the development of fully fledged associations comparing the advantages and problems created by mass production. In the late twentieth century, the problem began to be expressed in terms of consumer protection. Matthew Hilton compares the development of consumer movements in the West with the movements emerging in less-developed countries. In the richer countries, attention has always focused on protecting consumers from abuse by producers by pushing for a suitable, effective legal framework, although more recently the spotlight has been turned onto environmental issues. Ralph Nader is perhaps the most famous leader among these movements, and he showed just how much the legal aspects of consumption have their political side, too. Another iconic figure is Anwar Fazal, president from 1978 to 1984 of the International Organization of Consumers Union, then Consumers International, a movement that now has a presence in 115 countries. He took a different approach – the priority in many less-developed countries is not consumer protection, but the attempt to develop and spread as far as possible a reasonable level of consumer standards. What is more, the values underpinning Western consumerism, from individual ownership and pluralism, run up against a well-established tradition of common use of goods and leadership. As a result many Asian countries are seeking for an alternative to consumerism, one inspired by 'Asian values' that can repel the invasion from the West. Once again, consumption becomes politically charged and NGOs and international organizations become very important, overturning the accepted patterns of national political power (Hilton, 2009).

Many new insights have been offered by studies on consumption. As well as providing international viewpoints, they also turn their attention to areas like visual culture, take an increasing interest in the impact of new technologies on consumption models, make a more in-depth analysis of formal and informal political players, and examine fractures in the social framework – with great emphasis on gender, taking masculinity into account, age, ethnic factors, the influence of old and new immigration, etc. The promotion of important international initiatives for the study of consumption by a number of stakeholders is a sign of growing maturity in this field. An example is the 'Cultures of Consumption' program led by Frank Trentmann from 2002 to 2007 that produced many original studies and gave a great stimulus for examination of the sector. The history of consumption continues to provide an original mirror of the development of historical studies.

Methodology

In the light of what has been seen above, it is very difficult to identify a specific methodology for the history of consumption. In fact, it makes more sense to speak of different methodologies existing side by side. On the one hand historians make frequent use of traditional primary sources like private and public archives, printed materials (magazines, newspapers, and collections), collections of objects, visual sources, and advertising; while on the other there is increasing use of audiovisual sources linked to new media, the Internet, interviews, and oral histories. Of course, the use of such varied sources creates very different methodological problems, sometimes concerning different fields of specialization, and it is not always easy to integrate these into an overarching historical narrative. It goes without saying that the reference period in the history of consumption extends over centuries, so the tools of study and methodologies chosen must adapt to suit the characteristics of the subject with a certain degree of flexibility.

We should also point out that the reverse side to this great wealth is a persisting lack of theoretical reflection in the structure of the studies and methodologies adopted, something all too often implicit in the narrative. In the same way, complex studies of chronological and geographic synthesis exist beside microstudies, and the knot in the relationship between a national and transnational perspective does not yet appear to have been untied. Although a great deal can be done in this direction, the quantity and quality of the results obtained over 30 years remind us that this 'multiple' perspective is not the product of chance, but may be a characteristic of scientific studies that wittingly stand on the frontier.

Abstract

With the advent of consumer society, sociologists have investigated and developed theories on a variety of aspects of consumption to explain its relation to social structure and its cultural and social meaning. Although the focus has been in concert with social and economic changes, scholarly work has long established a link between social class/stratification position and cultural consumption, one of the classical perspectives that has a long history.

Introduction: Significance of Sociological Approaches to Consumption

Consumption has been studied in many fields of social and behavioral sciences such as economics, public policy, psychology, marketing, home economics, anthropology, history, as well as sociology. In early works in social sciences, consumption has often been conceptualized through analysis and interpretation of the sphere of production in the course of exchange of commodities in the market. Accordingly, one might think that economics has been in a central position in studying a variety of aspects of consumption. It is true that economists have spent considerable efforts trying to understand individual and household needs and expenditure, inherent qualities of goods and services, and how goods and services meet practical needs of consumers. However, most of the issues that are addressed in both disciplinary and interdisciplinary literature on consumption are absent in economics.

Mainstream economists' theories assume that consumers or households, as rational and selfish human beings, will attempt to maximize their overall levels of utility so as to satisfy their needs and wants. The levels of utility, or consumer preferences, are in principle independent of one's relationship with others. Economics has focused on how a society provides for consumer demand, but has not focused on the cultural qualities of goods, or what we call social and symbolic meanings of goods. Consumption in modern society is not what classical economic theories premised. Consumers often buy products for reasons other than the product's functional performance. They rather consume products for the cultural and symbolic meanings of the product. Consumption is not only a phenomenon that depends on the analysis of production; products are not just objects of use corresponding to requirements in the process of consumption. In fact, the essence of consumption lies in the irrational nature of human being, for example, insatiable appetite, luxury, out of ostentation, out of consideration of style, a demand for goods and services motivated by social stratification, etc. It is also an absolutely essential perspective for analyzing and theorizing consumption that it is influenced by real-world economic and social environment and the nature of consumption changes fundamentally with the time. It is important to take into account not only interaction between the agents communicating with each other but also analysis of the societies, transition in the nature of consumption, and interaction between consumers and their social settings.

With the advent of consumer society, sociological study of consumption has considered people's social relationship with others in the process of theorizing consumption behavior such as what motivates people to consume, what is the cultural meaning of consumption, how structures of inequality intersect with consumption, how people decide what products to consume, how advertising and marketing perform, what can result from them, etc. The arguments and concepts include, for example, conspicuous consumption by Veblen, pursuit of fashion, standard package by Riesman, and distinction. Sociologists have investigated and developed theories of consumption to explain the issues involved taking particular note of its relation to social structure and its cultural and social meaning.

Theoretical Development and Transition: Social Changes and Transition in Focus of Sociology of Consumption

The focus of sociology of consumption is in concert with social and economic changes. Sociological research on consumption is thought to have begun to emerge as early as the nineteenth century in response to the birth of capitalism and consumption revolution accompanying the modern Western market economy. When industrial revolution brought about many economic and social changes, the emergence and spread of the innovations of communication technology, the huge development of urban commercial space and mass press, and commercial advertising affected the consumption behavior of people.

Until the early stage of development of capitalism, only the highest ruling class people were able to exercise considerable discretion in consuming. Scarcity of necessities had been a central concern for most other social classes. From the late nineteenth century onward, with the growth in production, in Europe, England in particular, and America, the consuming class was no longer confined to the selected highest class and extended to the inferior classes. This brought about the rise of the middle classes in the nineteenth and especially twentieth centuries. Profound changes in the sphere of consumption caused by development of capitalism and the transformation in

the economy have drawn the interest of some sociologists. They include, for example, Tarde, Simmel, and Veblen, who theorized consumption and fashion. People increasingly tended to decide what to consume in attempting to differentiate themselves from others, and therefore many sociologists focused on ostentatious display of wealth or status-seeking consumption and the relationship between social class, consumption, and inequality. Also, the elites indulged in particular ways of consumption in order to differentiate themselves from the working class and kept changing their taste once their style was imitated by the people in the working class, which resulted in the emergence of fashion.

However, the early twentieth century, at the same time, was the period that the American market reached overproduction, which means production of goods exceeded consumers' demand. Especially in the United States around the 1920s, corporations started advertising to the working class in an effort to encourage new desire, embracing the idea that there were no limits on consumer wants and that such wants could be endlessly created and shaped. The social phenomena such that manufacturers create more demand by commercial advertising and other promotional devices and that consumption was controlled by manufacturers was critically analyzed by some sociologists. Critical theory, which emerged under the leadership of Adorno and Horkheimer, condemned consumer society. In the United States, from the post–World War era onward, the focus of a lot of sociological research such as that of Galbraith and Riesman has been on consumption pattern motivated by and fueled by the media, the effect of the emergence of mass, lifestyle and urbanization, and consumption as differentiation.

Since the 1970s, with highly developed consumer society as a backdrop, major theories of consumption have developed from varied perspectives. One of the influential arguments is Bourdieu's theory of cultural consumption and lifestyle. Another one is the work by Baudrillard, who is regarded as a priest of postmodernism, from symbolic approach to consumption. Several other postmodern theorists in the late twentieth century (e.g., Bauman, Beck, Giddens) also maintain, in contrast to the position by Bourdieu, that social stratification position has declining influence on the formation of lifestyles and the objects and patterns of consumption. They argued that in the postmodern era, where there is an increasing number of available commodities, lifestyles and consumption are critical to identity formation; at the same time, individuals are compelled to choose their identities. What this stress of the freedom implied by consumer choice means is that individuals have an equivalent degree of personal responsibility. Although postmodernists have emphasized the lack of correspondence between socioeconomic status and patterns of consumption, mainstream sociological research of consumption still focuses on the relationship between social stratification position and consumption. A lot of authors mostly in the United States, inspired by Bourdieu, have proposed a new relationship and explored applications of Bourdieu's theory of taste from around 1990 on the assumption that there are significant differences between France and other cultural settings such as America (Lamont and Lareau, 1988; Lamont, 1992; Peterson and Kern, 1996).

A more modern example of the authors who maintain a critical stance toward our consumer culture is Schor who coined the term competitive consumption to signify competition for conspicuous, status goods so as to keep up with the norms of the social group. The focus is on jeopardizing the quality of American life due to a growing aspirational gap, which means that desire and need exceeded consumers income, while at the same time pointed out the emergence of a society of simple livers, or downshifter.

Early Sociological Theories on Consumption: The Advent of Consumer Society and Consumption

One of the first systematic and influential studies of consumption and commodities in capitalist societies is by Thorstein Veblen (1857–1929). The ideas and concepts in his pioneering work *The Theory of the Leisure Class* published in 1899 made an important contribution to the field and following theorists. He emphasized that being able to be extravagant is a sign of privilege and he analyzed the feature of the upper classes: conspicuous consumption and conspicuous leisure fulfill the role of demonstrating their status to other social classes, the former displays the luxury material commodities and the latter, freedom from productive labor. He maintained that conspicuous consumption has an advantage over conspicuous leisure in a situation that the Gemeinschaft-type society, where people tend to settle in a certain region and know their neighbors, gave way to the Gesellschaft-type society, where one is anonymous and there is greater freedom from neighbors, that is, free time is comparatively invisible in impersonal urban societies, which was going on in the world at that time in the midst of rapid industrialization and liftoff.

As with Veblen, a lot of sociologists have theorized the notion that consumption plays the role of a method for achieving or expressing social status and prestige. Simmel and Tarde see consumption as a way to mark one's social belonging and class status. From the late nineteenth century through the beginning of the twentieth century, the emergence and the spread of the innovations of communication technology, the huge development of urban commercial space and of the mass press, and commercial advertising changed many aspects of the society such as rapid change of consumption behavior and behavior of masses.

In his work, *Les lois de l'imitation* (1890), French sociologist Gabriel de Tarde (1843–1904) theorized the principle of imitation focusing on the characteristics of fashion. According to Tarde, consumption has been viewed as an identity resource of the elite group and as a form of collective behavior at that time. People, in particular social class, imitate fashion, manners, as well as the ideas, wishes, and beliefs of their reference group and that is how fashion spread from the superior to the inferior and from the exterior to the interior.

This idea of imitation by Tarde and the idea of trickle-down theory by German sociologist Georg Simmel (1858–1918) have in common in the sense that consumption behavior transmits and diffuses from one social group, which often is superior, to other groups, which is lower level in many cases. Simmel argues that there are two engines of fashion change, differentiation and imitation, the opposing tendencies toward

conformity and individuality (1904). He theorized fashion as follows: fashion change is based on the tendency of the elite class to differentiate itself from the lower classes, reflecting their conformity; people emulate the consumption behavior of their superiors, that is, more specifically, middle class emulate the upper middle class, who emulate the elite class, in their attempt to achieve upward socioeconomic mobility. Accordingly, trends and innovations form at the top of the social and economic pyramid and trickle downward. At the same time, the elite class moved to adopt a new fashion in attempting to the differentiation. Simmel's analysis stresses the class-based differentiation and downward or 'trickle-down' spread of fashion along the class structure on the presupposition that most consumers of various social groups want the signs of the social elite for themselves.

Both Veblen and Simmel anticipated the birth of a mass consumption society and the escalation of its unfavorable outcome.

Criticism Over Consumer Society and Consumerism during the Postwar Period

Since around the 1950s critical sociologists provided some insight into consumer society and consumerism. *The Affluent Society* (1958) by John Kenneth Galbraith (1908–2006) is perhaps the most influential discussion of consumption in the post–World War II era. Galbraith argues that consumers' desires for goods and services are not intrinsic but that the production side creates consumer desire. This new desire is created by advertising, which adorns new commodities with more expressive and evocative meanings. He called this process the dependence effect, because wants depend on the process by which they are satisfied. He also claimed that resources are overproportionately invested in private production and consumption, and therefore this leads to a deficiency in the provision of public goods in the affluent society.

The Frankfurt School also developed a critical approach to culture and consumption in research into mass society. Max Horkheimer (1895–1973) and Theodor L. Adorno (1903–69) systematically analyze and criticize the industrialization of mass-produced culture around the 1920s and the 1930s in the United States. According to Adorno's and Horkheimer's arguments, in the article The Culture Industry: Enlightenment as Mass Deception (1944), culture industries, coined by them, played an important role in controlling over the whole society and individuals' personality structure became integrated into the needs of mass consumption economy. They presented their insight into the rise of consumer society and American capitalism well before the extensive critical arguments by postmodernists such as Baudrillard.

Meanwhile, in *The Lonely Crowd* (1950), David Riesman (1909–2002), who identified the social character types, claimed in times when consumption overtook production that members of a society became more other-directed. Under those circumstances people sought to become accepted into the mainstream by conforming to the expectations and preferences of peer groups. As a result, consumers are inclined to make relatively minor variations in the items to be consumed. Riesman coined the term standard package to signify the process of compulsive acquisition of commodities. He observed that there was a considerable degree of uniformity throughout American society by the effects of other-directed values on American culture. This is contrary to the viewpoint by Baudrillard, whose propositions are characterized as competition and personalization through consumption in the system of signs that differentiate people.

Postmodern Sociological Approach to Consumption Since the Late Twentieth Century Onward

Some sociologists claim that in postmodern consumer societies, consumption patterns no longer act to structure social classes. Consumption has been approached as the semiotic code constituting postmodern itself. French social theorist Jean Baudrillard (1929–2007), one of the leading postmodern social theorists of consumer society, centered his critical analysis on change in consumption in postindustrial societies. According to Baudrillard, "consumption is defined not any longer (1) as a functional practice of objects – possession, etc., or (2) as a mere individual or group prestige function, but (3) as a system of communication and exchange, as a code of signs continually being sent, received, and reinvented – as language" (Baudrillard, 1970/1998). This means that signs are consumed, not the objects. He also sees consumption undertake the role of integrating entire society, just like hierarchical or religious rituals did in primitive societies by training them in the unconscious discipline of a code, and competitive cooperation at the level of that code.

More recently, other postmodernists (e.g., Giddens, Bauman, Beck, and Featherstone) have conceptualized consumption as exemplifying the individualizing tendencies of a modern materialistic society. From this standpoint of individualization argument, they see consumption as central to identity formation by means of the cultivation of lifestyle (Bauman, 1988; Beck, 1992; Giddens, 1991). Consumption represents a principal mechanism through which individualization is expressed.

Theories of Social Distinction: Social Patterning of Cultural Consumption and Social Class

Scholarly work in the field of consumption has long established a link between social class/stratification position and cultural consumption, one of the classical perspectives with a long history. This relationship has been theorized most famously by French sociologist Pierre Bourdieu (1930–2002) in his work *Distinction* (1979/1984), whose theories were developed in the context of concrete empirical analyses of the French society during the 1960s and the 1970s. His analysis and the ones of several subsequent authors (e.g., Peterson, 1992) center on a variety of practices in different domains of consumption, in particular cultural consumption. Bourdieu, whose theoretical framework is identified as conflict theory, asserted that consumption patterns are not based only on individual desires, but on class location and habitus. According to Bourdieu, lifestyle is an expression of class position and that is a weapon in strategies of distinction and hence legitimizes and reproduces the class structure. There is a structural homology

between the space of social positions and the space of lifestyles. Specifically, Bourdieu differentiated highbrow, or legitimate culture, and lowbrow, or popular culture. Lifestyle of the higher status group is characterized by cultural refinement and snobbery, that is, the highbrow taste is a feature of the well-educated elite in the society; they, at the same time, disdain simple working class popular culture. Accordingly, people in higher social position tend to patronize the fine arts and avoid contact with popular entertainment, whereas people in lower position tend to enjoy 'brutish' popular entertainment. This is called the homology hypothesis. These distinctions in cultural preferences and lifestyles maintain social boundaries. In this manner, these differences of cultural practices establish symbolic boundaries between individuals occupying different locations in the class structure. The ruling class uses consumption styles in order to maintain its dominant position.

Such a standpoint for lifestyle as a means of differentiation and social reproduction is normally linked to Bourdieu, but Max Weber already discussed the importance of lifestyle for differentiation. Status, one of the principal stratification dimensions, is important in establishing class distinction; status groups are sustained by the collectivity of individuals who share similar consumption pattern and lifestyle.

Bourdieu theorized that family socialization process and educational experiences are the primary determinants of cultural capital, which in turn shapes people's tastes and preferences in combination with other forms of capital, or economic capital. Cultural practices and consumption such as patronizing the fine arts, preferences in literature or music, and manners and speech are closely linked to education and cultural capital inherited from one's social origin. Thus dispositions, to which he refers as habitus, that are acquired through the socialization process and produce individual practice and perceptions can be seen as a major predictor of cultural consumption patterns. He claimed "taste classifies, and it classifies the classifier. Social subjects, classified by their classifications, distinguish themselves by the distinctions they make, between the beautiful and the ugly, the distinguished and the vulgar, in which their position in the objective classifications is expressed or betrayed" (1979/1984).

Although Bourdieu's works have been highly praised, his theories attracted criticisms and alternative theoretical approaches emerged, devoting efforts to examining the validity of theories by Bourdieu in different time and space.

For example, since the 1980s some sociologists proclaimed 'death of class', which means that the works of Bourdieu are no longer applicable to modern society and new theories, for example, the individualization thesis, have been proposed instead. For all these arguments, however, the empirical validity of the arguments from postmodern perspective has been questioned due to the lack of compelling empirical data.

Some others claim that it is not necessarily appropriate to apply Bourdieu's theories to the situation in societies other than France. For example, Richard A. Peterson (1932–2010) and his collaborators (e.g., Peterson and Simkus, 1992; Peterson and Kern, 1996) emphasize that in modern societies the cultural taste of the higher status group is inclusive and broad, not snobbish or exclusive so that other nonelite classes are excluded as Bourdieu postulated. This is called the omnivore hypothesis. According to Peterson and Simkus (1992), high-status American people indeed are more likely to consume highbrow culture such as fine arts than lower status people, but only a minority of the higher status people consume any particular highbrow genre. Moreover, high-status people are more likely to enjoy many sorts of cultural activities. They also suggest that a historical shift from highbrow snob to omnivore is taking place. Empirical research that tested the relationship between cultural consumption and social status position in various countries shows that the cultural omnivore hypothesis rather than homology hypothesis by Bourdieu is currently an increasingly influential theory on the relationship between cultural consumption and social stratification.

Whichever hypotheses are taken, it is assumed that differential patterns in cultural consumption among individuals are related to their social stratification position. Substantial empirical studies have evidenced the existence of differences in cultural consumption between the higher status group and the lower status group in many societies in Europe, North America, and Australia.

Michèle Lamont, one of the sociologists who has been influenced by and builds upon the work of Bourdieu, also raised questions about applying Bourdieu's theories to the context of a different class structure on the grounds that these theories ignore national repertoires. She refers to the difference in lifestyle between France and the United States and shows that American upper middle class men make less use of high culture than their French counterparts do when constructing social boundaries and that both sets of people use several valued forms of culture (1992). She argued that highly educated people in the United States have cultural sophistication and also include mainstream culture, while in Europe there is a preference to remain culturally exclusive. There are more works on sociology of consumption from the point of view that difference in the mode of consumption reflects the difference in social groups such as gender, ethnicity, and culture in contemporary societies.

Downshifting, Sustainable Consumption, and Green Consumption

In theoretical discussion on sociology of consumption since Baudrillard, mainstream perspective has been the one similar to Bourdieu's, which understands consumption styles as related to the positions in social hierarchy and class dynamics. These ideas are succeeded by Juliet Schor who has developed the consideration on consumption in relation to both individuals' social position and working style, and the ideas about the people who have voluntarily changed their consumption behavior styles. Schor, whose research has been based on the analysis of the 1980s and the 1990s, argued (1992, 1998) that American people are increasingly involved in a vicious circle of overwork and overspend. This phenomenon has occurred because they keep upscaling their lifestyle norms, or competitive consumption. As has frequently been mentioned, identity is deeply bound with consumption and therefore individuals try to keep up with the group that they identify a reference group. Reference group in America today, however, is not neighbors or social group similar to themselves but the

lifestyles of the rich and famous have become a reference group for all people, due to, for example, decline of neighborhood contacts, less time with friends and family and instead more at work and in front of the television, as well as more married women entering the workforce particularly in white-collar jobs and being exposed to a more economically diverse group of people. At the same time, however, she introduces recent emergence of people who downshift: They downshift from their currently unsustainable high levels of consumption to simplified lifestyles, which means consuming less stuff voluntarily so as to put an end to the vicious circle of work and consumption.

As various strains brought on by consumption come to the fore, especially since the late twentieth and in early twenty-first centuries, an increasing number of concerns on the social consequences of consumption, such as global resource depletion and deterioration of environment, have been expressed in various researches on social and behavioral sciences. Their interests are why and how we are able to think about consumption behavior and lifestyles in relation to the issue of sustainability. From this standpoint, researchers raise awareness of the consequences of one's action, or consumption behavior, and advocate purchasing more green products and adopting alternative and more sustainable practices. Such concepts as sustainable consumption, green consumption, and ethical consumption become increasingly widespread in research on consumption in recent years mostly in Europe.

Abstract

Contemporary history ends with the present. Its starting point is contentious and depends upon the topic of study. It has been practised since ancient times but has become most popular since the 1960s. It has been criticized by conventional historians for the difficulty of examining the recent past objectively and the absence of adequate documentation. These arguments are rejected since they apply equally to all periods. Like the study of other periods, it has been influenced by changes in the contemporary world and by the changing interests of historians such as the growing influence of social and cultural history since the 1960s.

What and When Is Contemporary History?

Periodization in history is always problematic and contentious, no less for contemporary history than for any time period. Unavoidably, historians of all times and places find it hard to agree on precisely when the period they identify with begins and ends. This is partly because historians have diverse preoccupations, necessarily if we are to gain a reasonably comprehensive understanding of the past, and because nations and societies do not experience all-pervasive breaks, even following a serious crisis such as war, revolution, occupation, or plague. Some features of the society may continue, such as religious faith or family structure, which will preoccupy some historians, while others focus on the experience of rupture.

However, one essential element of periodization is agreed among contemporary historians: their period ends with the present. It includes the history of the very recent past, so the end point of contemporary history is agreed but is constantly shifting. Where it begins is more contentious. Some have argued, in the past, that contemporary history is the history of the generation now living, or events within the lifetime of the historian. This will not do because generations overlap and some lives are very long. This definition leaves us with "ever-changing boundaries and an ever-changing content, with a subject matter that is in constant flux" as Geoffrey Barraclough wrote in his *Introduction to Contemporary History* (1966: pp. 13–14), the first modern work in English to tackle the subject. As he pointed out, at the time he was writing (the book was first published in 1964), it was still possible to meet people who had conversed with Bismarck, and others "for whom Hitler was as much an historical figure as Napoleon or Julius Caesar" (p. 13).

Barraclough proposed two complementary definitions of contemporary history. Firstly, it was the history of a time period: he argued that contemporary history should be dated from the late 1950s, when an array of major historical changes were clearly established, including the emergence of the United States and Russia as 'superpowers' and the weakening of Western Europe; the breakdown of empires; 'the readjustment of relations between white and colored peoples'; and the thermonuclear revolution and other technological transformations. 'Taken together' he argued "they give contemporary history a distinctive quality which marks it off from the preceding period" (p. 17). But, Barraclough argued, to understand the nature and significance of these changes the study of contemporary history should begin around 1890, when 'the forces took shape that have molded the contemporary world.' At this time, among other things, economic exchange became truly global; empires reached a peak; labor movements grew and strengthened and socialism became a strong force; more nations moved toward modern democracy; and European nations adopted alignments that would lead to two world wars.

But still, warned Barraclough, "we shall do well to beware of precise dates. *Contemporary History begins when the problems in the world today first take visible shape*" (my italics: p. 20). He recognized that, in order to understand certain contemporary phenomena, a much longer timescale was needed than for others. We might today give the examples of wars in Afghanistan, or of financial crises, understanding both can benefit from historical analysis but the timescales are very different. The second definition of contemporary history, he believed, was its capacity "to clarify the basic structural changes which have shaped the modern world," which "may take us far back into the past." (pp. 16–17). Hence "we cannot say that contemporary history 'begins' comprehensively in 1945, or 1939 or 1917 or 1898 or any other specific date we may choose"(p. 20). The beginning depends upon the aspect of the contemporary world under scrutiny. However, for practical purposes, such as teaching courses in contemporary history, a time frame must be chosen. When the aim is to teach the history of the recent past, or to convey a sense of it to a wide audience, rather than to explain a particular event or set of events, the choice may be somewhat arbitrary, determined by what is manageable in the time available.

Dating key features of the contemporary world to the late 1950s made sense in 1964. Fifty years later we might think differently. Since 1989, Communism has almost vanished from Europe and socialist ideas are more fiercely challenged everywhere than before. The Cold War is over and the Russia is much less influential, and so, more gradually, the influence of the United States has begun to dwindle, while China (still officially Communist) has become increasingly powerful in the world economy and politics. Versions of Islam influence world affairs as they have not for centuries, as do the politics of countries in which it is powerful. The invention of the World Wide Web has revolutionized communications, pervasively influencing everyday life including in entertainment, shopping, and politics. Though these changes need to be seen in context. As David Edgerton has argued, old technology has never ceased

to be important. The world consumed more coal and steam power was more widespread in 2000 than in 1950 or 1900 (Edgerton, 2006). The bicycle is still an important, and in Europe a growing, means of transport, much encouraged as a source of exercise and good health. Similarly, old ideas, sometimes very old such as religious faith, and practices, political, social, and cultural as well as technological, have not disappeared but profoundly influence day-to-day life.

The Long History of Contemporary History

Contemporary history became a notably active preoccupation of historians in the 1960s, hence Barraclough's book, but it was by no means a new concept. As with many contemporary themes we need to probe far back into the past to understand its origins and development. Benedetto Croce claimed in 1917 that "every true history is contemporary history" (Croce, 1917). He meant something different from Barraclough and most contemporary practitioners in the field, that the work of the historian of any period is influenced by present preoccupations and by the historian's personal experience. This is widely agreed. The term has come into common use and into university syllabuses relatively recently, since the 1960s, especially since the 1980s, but it is older than Croce. It made an early English-language appearance in the *Edinburgh Review* in 1808 (vol 12: p. 480) with the (now contentious) comment:

> There is this general distinction between Contemporary History and all other history- that the former is a witness, the latter a judge.

Yet the practice of studying the immediate past, up to the present, is a great deal older still. Thucydides, recognized as one of the greatest ancient historians, writing about the Peloponnesian wars as they happened (431–404 BC) and in which he had fought, rested his narrative "partly on what I saw myself, partly on what others saw for me," aiming to record the war accurately, in view of its intrinsic interest and importance, and to provide political lessons for the future. He hoped that his History would be useful to 'those who desire an exact knowledge of the past as a key to the future, which in all probability will repeat or resemble the past. The work is meant to be a possession forever, not the rhetorical triumph of an hour.' His ruling principle was strict adherence to carefully verified facts:

> As to the deeds done in the war, I have not thought myself at liberty to record them on hearsay from the first informant or on arbitrary conjecture. My account rests either on personal knowledge or on the closest possible scrutiny of each statement made by others. The process of research was laborious because conflicting accounts were given by those who had witnessed the several events, as partiality swayed or memory served them.

Problems that present day contemporary historians will recognize and which have been analyzed extensively by practitioners of oral history (Perks and Thomson, 1998).

Through the next 2000 years others wrote the history of their own times, designed to convey lessons as much as to expand knowledge. In England, Edward Hyde, Earl of Clarendon, adviser to Charles I, and Lord Chancellor to Charles II, late in life wrote *The History of the Rebellion and Civil Wars in England* (1702–1704), which he had experienced and with which he had no sympathy, a work designed to justify and praise the restoration of the monarchy. Thomas Babington Macaulay, politician and imperial administrator, part of a newly influential professional middle class, wrote his widely read four volume *History of England* (published 1848–1861, the final volume after his death), as uncritical celebration of the period since the Glorious Revolution of 1688. He described it as a time of brilliant progress, unique to England at the time, culminating in the Great Reform Act of 1832, which brought the middle classes into political power, and the repeal of the Corn Laws in 1846, which established free trade and further economic expansion, making England the dominant world economy. Democracy, he argued, had then gone far enough and acceding to the growing demands of the lower orders for inclusion could only undermine England's greatness.

Interest in studying the immediate past has often been sparked by a specific crisis – in Macaulay's case, the stirrings of working class discontent in the early nineteenth century – and the desire to understand its origins and impact. For some European historians in the nineteenth century, the French Revolution of 1789 was such an event, though historians of different political persuasions appropriated it in different ways. For conservatives, the French defeat at the hands of Prussia in 1870 demonstrated that the Revolution of 1789 had undermined national cohesion. Hippolyte Taine's *Origines de la France Contemporaine* (1875–93) explained what he believed to be the debility of contemporary French society as a legacy of the Revolution. The *Société d' Histoire Contemporaine*, established in 1890 by Catholic conservatives, espoused such views, while the Left developed its own version of recent history, celebrating the revolution. Emile Bourgeois (1886) rejected Taine's interpretation while accepting that his work was no less valid than writing the history of earlier periods. The Republicans created a Chair in Modern and Contemporary History in Paris in 1884 and, once established in the University, historians of the Left founded the *Revue d'Histoire Moderne et Contemporaine*, also in 1890. The two factions fought for control of the official history texts taught in schools, which included, from the Left, Ernest Lavisse's 10-volume *Histoire de la France Contemporaine de la Révolution à 1919*, one of several texts he produced for schools in the 1880s and 1890s (Noiriel, 1998).

As History became professionalized as a university discipline from the later nineteenth century it defined itself strictly as a study of the 'past,' of times beyond the memory of the living. It sought clearly to differentiate itself, its subject matter and its methods from the other emerging disciplines of the day, as universities themselves emerged in their modern forms and grew in number and diversity of areas of study. The past was the domain of the historian, the present and recent past that of the emerging disciplines of politics and economics, later also of the newer fields of anthropology and sociology. Professional history's source materials were, above all, documentary archives, the remnants of the past. This was despite the fact that one of the dominant figures in the nineteenth-century

professionalization of history, Leopold von Ranke, himself lectured on events in German history occurring during his lifetime, including the revolution of 1848 and the founding of the German Empire in 1871, as did a number of his contemporaries.

The highly committed, politicized nature of much that calls itself contemporary history, as in nineteenth-century France, probably hardened resistance to it among the majority of the earlier generations of professional historians. They believed that the practice of history required total emotional detachment from the subject in hand, that it was necessary to establish 'the facts' wholly objectively, regarding this as an essential dimension of their professional identity, which they were convinced was unattainable when studying the times the historian had personally experienced. Ranke urged the need to extinguish oneself (*sein Selbst ausloeschen*), all of one's values, in order to engage in reliable historical research.

For even more historians in the twentieth century, it was the Nazi regime and the horrors that resulted in an apparently civilized continent that required understanding. In the early 1920s, Dr Alfred Wiener, a German Jew, was horrified by the rise of antisemitism, campaigned against it and collected documents about it. These were lost when he fled Germany in 1933, first for the Netherlands, then for London, but he carried on collecting. After the war, the collection became the Wiener Library in London, still a preeminent archive of Nazism and antisemitism, which assisted the prosecutors at the Nuremberg Trials, amassed early survivor testimony and helped shape the academic study of the Holocaust which emerged after the war. It later also took the name Institute for Contemporary History (www.wienerlibrary.co.uk).

Also in 1949, the Federal Republic of Germany, soon after its own establishment, set up the Deutsches Institut für Geschichte der nationalsozialistischen Zeit in Munich for, as its name suggests, study of the Nazi period. In 1952, it was renamed Institut für Zeitgeschichte and gradually broadened its interests in recent German history (www.ifz-muenchen.de). Meanwhile in France, in 1944, shortly after the Liberation, de Gaulle's provisional government established a commission on the history of the occupation, resistance, and liberation, which, in 1951, became the Committee on the History of World War II. In 1978, this became, and remains, L'Institut d'Histoire du Temps Présent, with a wider historical remit (www.ihtp.cnrs.fr). After the downfall of communism in Europe, institutes were established in postcommunist countries to examine their recent histories, including the Czech Republic, Romania, and Slovenia. The Slovenian Institute, in Ljubljana, was established in 1959 as the Institute for the History of the Workers' Movement. It included an archive of the wartime occupation and resistance movement. By the 1970s, it was studying the history of Slovenia throughout the twentieth century. After the end of communism in 1989, it persuaded the authorities to rename it the Institute of Contemporary History and it gradually broadened its interests to cover economic and social history (www.inz.si/history.php). The histories of these institutions in themselves tell us something about contemporary history.

The origins of Nazism and the war, and later of Communism and its effects, had deep and long roots and the problem of where to begin to study such major themes remained, as Barraclough realized when writing his first book, *The Origins of Modern Germany*, published in 1946. This covered the period 800–1939, with a concluding chapter, "Germany yesterday, today and tomorrow." He started to write it during the war, while serving in the UK Royal Air Force, following 15 years studying German history before the war. He brought it as close to the present as he could at that time.

As the practice of contemporary history grew, most strongly from the 1960s, 1945 became a favored starting point, probably because contemporary history, like most professional history, tended at this time overwhelmingly to focus on political history, national and international. And post-1945 politics – the world of the Cold War and decolonization – seemed very different from what had gone before and to require new explanations and forms of analysis. But many historians recognized that analysis of the post-1945 world could not begin in 1945 if it was truly to be understood. When what became the leading international journal in the field, the *Journal of Contemporary History* – its founding itself a sign of the substantial new interest – was established in 1966, shortly after Barraclough published his book, it set out to study mainly European history throughout the twentieth century. Its founding editors were George Mosse, a German-born, Jewish American who had published widely on Nazism, and Walter Laqueur, also American and Jewish, who published on the history of fascism and communism and was then director of the Wiener Library and Institute of Contemporary History in London and professor at Georgetown University in the United States. Their own professional preoccupations did much to shape the journal in its early days. They acknowledged in their opening editorial that their definition of the field 'is bound to be to a certain extent arbitrary both in time and space.' They were 'aware that the first world war (not to mention more recent events) cannot really be discussed without reference to trends that go well back into the nineteenth century.' They also recognized that Europe did not exist in isolation from the rest of the world. They pledged to 'try to be sufficiently elastic in their editorial policy to accommodate contributions that at first sight seem to transcend the Journal's frame of reference' both in time and space. So the journal has done and its subject matter has reflected changing preoccupations in the broad field of contemporary history.

Contemporary History since the 1960s

The longer time span has become more commonplace in European university courses and journals since the 1960s, above all because of the evident difficulty of explaining important features of the world since 1945 without looking at least back to the later nineteenth century. Also the generation was emerging for whom 'Hitler was as much an historical figure as Julius Caesar' and they had wider interests, influenced by the changing world around them. It was impossible, for example, to understand the then rapid process of decolonization, for example, without a sense of how Empires had come about and their effects; or why West European countries felt a need to develop 'welfare states' after the war without understanding the extent of poverty and inequality past and present; or why, from the 1960s, women, excluded racial groups and homosexuals,

among others, were demanding equality so fiercely in so many countries, without awareness of the long history of the inequalities they had experienced.

Also, from the 1960s, the range of professional history writing widened and subspecialisms grew, challenging the dominance of political history. This was less wholly new than some thought at the time. In reality, political history had not held exclusive sway for some time. Economic history had begun to develop in the interwar years, closely linked with what came to be called social history. In 1926, R.H. Tawney, in *Religion and the Rise of Capitalism*, traced the origins of modern capitalism (of whose unequal outcomes he was a critic, actively supporting and advising the British Labor Party) back to early modern times and stressed the formative influence of protestant religion, combining cultural and economic history. Eileen Power, one of the first female professors of Economic History, at the London School of Economics, and a feminist, wrote and broadcast in the 1920s on the new medium of radio, about medieval women and other aspects of medieval social and economic history (Berg, 1996).

In France, the journal *Annales d'histoire économique et sociale*, was founded in 1929 as a direct challenge to the dominance of political history in France. It aimed to integrate the study of society, economy, politics, intellectual life, geography, and demography, ideally over long time periods up to the present, in order to understand the complex interactions that constitute a society, regarding the present as history as well as the distant past and skeptical about the existence of radical breaks in history. The *annalistes*, a self-conscious 'school,' drew on the growing insights and methods of the social sciences to enrich historical research.

In Britain, G.M. Trevelyan's *British Social History: a survey of six centuries, Chaucer to Queen Victoria*, written before the second world war in Britain, published in the United States in 1942 (perhaps with the original intention of informing a nation hesitating to enter the war on Britain's side, before it was impelled to do so by the Japanese attack on Pearl Harbor in December 1941). Trevelyan argued for the importance of social history not, as he is constantly misquoted, as 'history with the politics left out,' but as "the required link between economic and political history … without social history, economic history is barren and political history is unintelligible" (1942/1967: pp. 9–10). Trevelyan was concerned with a very contemporary question, the characteristics of the British culture that the nation was fighting to defend in the second world war, recognizing the need to trace its construction over many centuries, examining as many dimensions as possible: "the daily life of the inhabitants … the human as well as the economic relation of different classes to one another, the character of family and household life, the conditions of labour and of leisure, the attitude of man to nature, the culture of each age … took ever-changing forms in religion, literature and music, architecture, learning and thought" (1942/1967: pp. 9–10). He aimed originally to bring the book up to the time of writing, but "the war has rendered it impossible" (p. 9) though he hoped it would still serve its contemporary purpose.

These historians, and others in Britain and elsewhere, challenged the dominance of political history before the 1960s (Floud and Thane, 2005), but social history became much more prominent from the late 1960s. It was partly impelled by very contemporary concerns, of a newly active Radical Left, often influenced by Marxism, challenging continuing social and economic inequalities, allied with emerging antiracist, feminist, and gay campaigning groups. These movements influenced and extended the work of professional historians, some of whom were activists themselves, into topics, such as the histories of slavery and colonialism and their legacies, of gender inequalities, and of repression of homosexuality, for which the conventional political boundaries, such as the dates of wars, were largely irrelevant. It was also influenced by the gradual entry of rather more women and members of other excluded groups into what had previously been an overwhelmingly white, male historical, indeed wider university, profession.

Such histories challenged and extended conventional narratives about the contemporary world. For example, for some time, influential Anglo-American sociologists had explained the characteristics of the family in the contemporary 'developed' world in terms of the increasing isolation of the 'nuclear' core of parents and children from wider kin, as industrialization and migration disrupted 'traditional' agrarian society, which was supposedly static and composed of coresiding, coworking family groups, whereas, they believed, fast-moving modern society divided the generations geographically and emotionally, creating, it was said, unprecedented problems of isolation for older people and less grandparental care for the young. This tidy scheme owed nothing to historical research. From 1964, the demographic, previously intellectual, historian, Peter Laslett, in Cambridge, drew on the methods of the *Annales* school and the novel, if still cumbersome, aid of computers to explore the history of the family in England using parish records of births, marriages, and deaths back to their origins at the Reformation and the formation of the Church of England in the sixteenth century. New technology assisted new approaches to the history of the recent and the more distant past. Laslett and his colleagues in the Cambridge Group for the History of Population and Social Structure, which he founded, examined the actual history of English family structures and asked whether change had indeed taken the form that the sociologists claimed. They discovered a preindustrial society in England that was far from static, in which migration over long distances in search of work was common, large coresiding kin groups uncommon and nuclear families as normal as in the twentieth century, while higher death rates and lower life expectancy at all ages often left children without grandparents and older people without surviving children. Family structures had changed much less than had been believed. Findings that were later replicated for other parts of Northwestern Europe (Laslett and Wall, 1972; Wrigley and Schofield, 1989). Study of a key social institution over several centuries deepened understanding of its contemporary characteristics, leading to recognition that intergenerational ties were at least as strong, and possibly stronger, than in the preindustrial past in the contemporary world where life expectancy was longer and modern technology assisted communication between kin over long distances in unprecedented ways. They demonstrated that studying the history of social as well as political institutions could extend knowledge and understanding of contemporary issues.

Flexibility over the appropriate time period to study continues to characterize contemporary history. The journal

Contemporary British History, founded in 1986, focuses on the period since World War I, yet in a special issue on health inequalities in the later twentieth century the editors thought it helpful to publish an article on dimensions of inequality, 1700–2000 (*Contemporary British History*, Autumn 2002). Similarly, for reasons of manageability in the time available, contemporary history courses in European universities mainly focus on the period from the early twentieth century, examining still earlier periods when the topic requires it.

Approaches, Sources, and Methods in Contemporary History

Contemporary history may be pursued out of simple curiosity to explore and understand the recent past in all its dimensions, or in order to understand the origins and effects of a particular event or set of events or processes, sometimes for overtly political reasons such as to influence policy decisions, though often not. As the practice of contemporary history grew after 1945, it was much criticized on the grounds familiar since the nineteenth century, that the objectivity required of the professional historian was impossible toward events in the historian's own lifetime, which might have touched her or his own existence. This implied that distance in time necessarily created an objectivity that was impossible in relation to recent events. This overlooked the passionate partisanship professional historians could display over many other themes, such as long past events like the English Civil War of the seventeenth century; the deep repugnance of many of them toward slavery and long past repressive acts by imperial powers; and partisan conflict over the impact of industrialization on working-class living standards such as that waged between Marxists, who took a doom-laded view, and their more optimistic opponents in the late 1950s and early 1960s. (Hobsbawm, 1964; Hartwell, 1961).

The first editors of the *Journal of Contemporary History* countered with the argument that 'Distance in time … involves remoteness, lack of immediacy, difficulty in understanding the quality of life of a period that is hard to describe and define, but which may become as important as all the documents in the archive.' Indeed there were those who argued, in relation to World War II, that only those who had been closely involved, as victims of perpetrators of the horrors of the Nazi concentration camps or Japanese prisoner of war camps, could truly understand all dimensions of these experiences. These were not new observations. Alexis de Tocqueville, reflecting on the French Revolution commented that what contemporary writers:

> know better than does posterity are the movements of opinion, the popular inclinations of their times, the vibrations of which they can still sense in their minds and hearts. The true traits of the principal persons and of their relationships, of the movements of the masses are often better described by witnesses than recorded by posterity. These are necessary details. Those close to them are better placed to trace the general history, the general causes, the grand movements of events, the spiritual currents which men who are further removed may no longer find since these things cannot be perceived from the memoirs. (Quoted in Schlesinger, 1967)

Or as George Santayana later put it:

> It is not true that contemporaries misjudge a man. Competent contemporaries judge him … much better than posterity, which is composed of critics no less egotistical, and obliged to rely exclusively on documents easily misinterpreted. (Quoted in Schlesinger, 1967)

Also, for historians to believe that objective study of the contemporary world was impossible was, somewhat arrogantly, to dismiss the work of social scientists, who engaged in just that, and to refuse to recognize that historians could learn from their methods and experience. Indeed, the growth of the social sciences after World War II encouraged the spread of contemporary history, by making more widely accessible techniques for analysis of the recent past, previously neglected or scorned by historians, such as interviews, the use of contemporary documents such as letters, sources such as newspapers and such new resources as film and sound recordings. Contemporary history was frequently criticized by university historians on account of the limited availability for the recent past of the historical documents conventionally used by political historians. Political history relied predominantly upon government archives, which in most countries were closed for at least 40 or 50 years (in the case of the most sensitive for much longer or forever), as were many personal archives of prominent people, including monarchs and presidents. Since such sources were not accessible for the period of closure, it followed that, for conventional historians, contemporary history was impossible.

Nonetheless, the first editors of the *Journal of Contemporary History* were optimistic that

> there are few major secrets in modern democracies that can be kept for longer than a year or two; the time lag in dictatorships is unfortunately considerably longer, but it seems doubtful whether anything really important can be kept secret for very long even there. In any case, more often than not, the contemporary historian of Europe or America in the sixties is more likely to be confronted with a surfeit of source material rather than to suffer from a lack of documentary evidence. (JCH: p. iii.)

Indeed, extensive government archives were themselves a relatively recent phenomenon, following the growth of large and effective bureaucracies in more developed countries in the later nineteenth century. For previous periods, documentary sources were often patchy, selective, and biased toward an elite, male minority whose papers survived and therefore might dictate possibly selective readings of the past. This view also overlooked the selective nature of government archives even in the more recent past. There was, and is, no means of knowing which sensitive papers might have been destroyed or withheld. Only in 2011 was it discovered that the British government withheld from public access, and stored secretly in the British countryside, 8000 shelves of documents concerning the British army's maltreatment of insurgents during the independence struggles in Kenya in the 1950s. Under the then-prevailing 30-year rule, they should have been released to the National Archives in the 1980s. They came to light only when some

aging survivors of British brutality sued the British government, successfully, in 2011, and because UK Freedom of Information (FOI) legislation, passed only in 2000, permits requests for access to hidden documents (though these are not always agreed readily or at all). The furore that resulted when the existence of the documents was reluctantly revealed, was supported by many historians. This led the UK Foreign and Commonwealth Office, equally reluctantly, to reveal, in 2013, that it had a further 1.2 million files hidden in another country store, some going back at least to the Treaty of Paris of 1856 which ended the Crimean War, but too sensitive to release for over 150 years. It later became known that substantial numbers of documents had been destroyed, on the instruction of government ministers, to prevent material that 'might embarrass government … police, military forces, public servants or others' being revealed to postindependence governments (The National Archives, November 2013; *The Guardian*, 29 November 2013).

Such suppression by governments of shameful episodes in history, leading to pressure from historians for greater openness has not occurred only in Britain. To give just one example, Japanese governments have been very reluctant to respond to historians' demands to inform schoolchildren about Japanese atrocities during World War II, especially in China. Furthermore, the museum commemorating the atomic devastation of Nagasaki in 1945, providing what appears to be the official view, gives notably little indication of Japanese war guilt, in contrast to the museum in Nanjing, China, which commemorates the well-attested Japanese massacre of that city in 1937.

All such revelations justify the suspicions of skeptical historians that we cannot rely on official archives to reveal all the truth about history, that historians of all periods must be wide ranging and inventive in their search for sources and be well aware that all historical findings, about any period, up to the present, are provisional and can be overturned by discovery of new sources and new research at any moment. The belief that historical research, in any time period, seeks objective, factual truth rather than being part of a process of gradually, partially, piecing together an understanding of the past, can no longer be sustained and very few historians would try. This applies as much to historians of the contemporary world as to all others.

Despite closures, over time more official documents have been opened at earlier stages than before, facilitating contemporary history. Franklin D. Roosevelt set an example in the United States by decreeing that his personal papers should be donated to the national archive after his death and be made quickly accessible. His successors followed his example, establishing Presidential archives that are no longer closed for a generation. Since the death of John F. Kennedy, Presidential archives have included interviews with prominent figures and observers of the period of office of the President in question.

FOI, the right of historians and others (often journalists or campaigners) to request access to documents falling within the designated period of closure has spread over a similar period. It was introduced by law in the United States in 1966. But it is only a partial blessing to historians. Requests can be refused and government departments have various means of evasion: in Britain, a request can be refused if it is deemed too costly to make the required search, as it frequently is. In 2013, the Ministry of Justice, which administers FOI, further refused to publish statistics of successful appeals against refusal on the grounds that this also would be too costly (Hansard, *House of Lords*, 6 November 2013). Furthermore, there is the very real danger that, as historians in Sweden have put it, FOI leads to 'the emptying of the archive,' to politicians and civil servants committing fewer sensitive issues to paper for fear of exposure (Kandiah, 2008). Sweden was the first country in the world to guarantee public access to government documents in its constitution of 1766. But, even in Sweden, legislators can deny access to specific documents. There is a right of appeal, but appeals are not invariably successful. Of course historians have never had access to past face-to-face conversations about government business, which might be crucially important, or, since the invention of the telephone, to communication by that means. Newer technology is creating further obstacles. Students of history since the 1990s may find surviving official sources dwindling ever faster as communications by e-mail and other forms of new technology are preserved imperfectly, if at all.

Such problems have made contemporary historians inventive in their use of sources. They have been assisted by the availability of a wider range of sources and helped as well as hindered by new technology. Oral history came widely into use as a direct response to the growth of social history in the 1970s, with its growing interest in the history of the everyday lives of 'ordinary people' and awareness that their experiences and opinions rarely surfaced in official documents. A pioneer was the American Studs Terkel (a popular, not a university, historian, among his many other talents) who used oral history to explore social inequalities in the United States, published as *Division Street America* (1966), *Hard Times. An Oral History of the Great Depression* (1970) and *Working* (1974). The journal *Oral History* started in Britain in 1972. Oral history drew on the experience of sociologists and anthropologists for interviewing techniques, greatly assisted by new technology, as increasingly portable recording machines became available from the 1960s. Again, it faced the skepticism of conventional historians that individuals were less likely to tell 'the truth' in an interview than in a written document. This overstated the reliability of many documents as well as the gullibility of historians, who learned to interpret interviews as skeptically as any document and, as with documents, to seek corroborating sources for any assertion, while recognizing that the story presented by an interviewee represented one version of the events in question, which required careful interpretation. (Perks and Thomson, 1998).

The recent past has created ever newer media representing aspects of the contemporary world – film, television, sound recording – which demand new skills for their interpretation, as do the study of the press, memoirs, letters, diaries, and other personal documents, which it has become more common to use by political as well as social historians. New media will present new challenges to future contemporary historians, and others as they recede into a new past. Contemporary history must continue to be inventive, as it has always been while keeping up with an ever-changing present.

Content Analysis

Carl W Roberts, Iowa State University, Ames, IA, USA

© 2015 Elsevier Ltd. All rights reserved.

Abstract

The article's emphasis is on methods that content analysts have developed to draw inferences about large corpuses, or populations, of texts. After having acknowledged that language is not a neutral medium through which 'content' is unambiguously transmitted, researchers must make four key decisions: Are words only to be counted or are word relations to be encoded? Are word relations to be depicted as network characteristics or as variants of a semantic grammar? Do researchers presume they know more or less than the texts' sources regarding the latter's words? Are the texts under analysis being viewed as windows into sources' perspectives or, alternatively, into events experienced by sources? Only once these decisions are made, can one identify the types of research questions afforded by content analysis.

Introduction

Content analysis is a class of techniques for mapping symbolic data into a data matrix suitable for statistical analysis. These techniques may be applied to any representative sample of cultural artifacts (e.g., books, paintings, technological innovations, etc.), whereby various nonnumeric attributes of these artifacts are mapped into a matrix of statistically manipulable symbols. Thus, content analysis involves measurement, not 'analysis' in the usual sense of the word. Whereas one might perform a content analysis of campaign slogans, one uses the data generated in such a content analysis to analyze (i.e., not 'content' analyze) the slogans' effects on public opinion. Texts and transcripts have been by far the most common objects of content analysis. For this reason, this article will focus on the content analysis of texts (i.e., on quantitative text analysis). Discussions of qualitative text analysis techniques are available elsewhere (*see* Archival Methods; Ethnography; Event History Analysis: Applications; Linguistic Turn and Discourse Analysis in History; Qualitative Methods, History of).

Classical (or Thematic) Content Analysis

The first large-scale applications of content analysis came with World War II and the US government commissioned propaganda analyses performed by Lasswell, Berelson, George, and other content analysis pioneers. During the first decade of the postwar era, a classical approach to content analysis emerged that involved the generation of data matrices of a particular type. These matrices typically exhibit a row for each sampled text block and a column for each theme (or meaning category) that may or may not have occurred in each block. Cells in the matrix are counts of the number of times the theme associated with its column occurred in the text block associated with its row. Thus, classical content analysis – later called *thematic text analysis* – typically produces matrices of word or phrase counts, albeit sometimes ones embellished with value and salience weights (cf. Stone et al., 1966; Holsti, 1969; Smith, 2008).

During a conference held in 1955 at the University of Illinois-Monticello's Allerton House, many of these text analysis pioneers gathered to develop solutions to the methodological problems of the day. Pool (1959) was the scholarly legacy of this conference. The most influential, if not the largest, faction among the participants was a group of Harvard researchers who made extensive use of a thematic text analysis technique that they called 'contingency analysis.' After generating a matrix of theme occurrences, these researchers would compute a matrix of pairwise associations among the themes. Contingency analysis then proceeded as the researcher developed (usually post hoc) explanations of why some theme pairs co-occurred (i.e., were positively associated) and why others were dis-associated (i.e., were negatively associated).

In his contribution to the conference's proceedings, Osgood (1959) raised critical questions about this burgeoning contingency analysis technique. Surely one may legitimately draw inferences from thematic text analyses about 'what' texts' sources were writing or speaking about. Yet contingency analysts were going beyond this by making inferences about word relations without having encoded these relations in the first place – a flagrant commission of the ecological fallacy (*see* Ecological Fallacy, Statistics of) by inferring words' clause-level relations from their aggregated associations among text blocks. In Osgood's words, "The final stage, in which the analyst interprets the contingency structure is entirely subjective, of course" (1959, p. 76). Although there may be relatively little ambiguity in *what* words are used in texts, even honest researchers are likely to disagree in their subjective interpretations of *how* these words were used. Moreover, such disagreements may stem from some researchers' presumption that a text's source knows better than they do what the source's words mean versus others' presumption that their interpretation "is beyond the voluntary control of the source and hence yields valid inferences despite the strategies of the source" (Osgood, 1959, p. 75). In sum, the content analyst should consider not only how texts' words are related (preferably by eliminating post hoc subjective inferences and encoding both words and their relations before statistical analysis), but also whether the text's source is an unwitting novice or the ultimate authority regarding its meaning. If only for these reasons, it is meaningless to allude to 'the content' of a text without having first specified which 'word usages' and whose understanding – researcher's or source's – of these usages are deemed meaningful.

The next two sections of this article review recent developments in text analysts' methods for addressing each of these problems (i.e., the problem of measuring relations among

words and the problem of presuming researcher's versus source's interpretive expertise). The following section introduces the ongoing issue of whether a text population is being used to draw inferences either about sources' perspectives or about historical facts. The essay's conclusion then sketches out the domain of research questions that content analysts can address.

Theme-Relations within Networks versus Grammars

Every statistical analysis is based on a representative sample of phenomena. In text analyses, these phenomena are blocks of text (books, editorials, responses to open-ended questions, and so on) that together make up a well-defined text population (e.g., all health-related editorials published in the *New York Times* between 1965 and 2012). In a thematic text analysis, the words in these text blocks are merely counted. Now imagine that you wish to analyze not only 'what' but also 'how' words are used in a specific text population. Although impractical, one such relational approach to content analysis would be to map all grammatical relations among all words in each text block. Thereafter, one might even map relations among sentences – an activity referred to in the structuralist literature as the identification of components in a 'story grammar.' (In a sample of debates, e.g., such components might consist of problem, argument, rebuttal, reformulation, and solution.) Yet even if one could overcome the logistic challenges required in accomplishing a total mapping of all words and relations in a text block, there would still remain the *statistical* challenge of 'flattening' this network of word- and sentence-relations into a matrix of rows and columns.

Relational approaches to text analysis virtually always involve defining which word-relations are to be encoded. For example, one might only consider subject–verb–object (SVO) relations in the texts, thereby eliminating 'extraneous' parts (e.g., prepositional phrases) of each text block in the analysis. Thus, one already discerns an important difference between relational and thematic text analysis methods in that words eliminated in the former would have been counted in the latter.

After transforming text blocks from collections of words to collections of tuples (here, of SVO-relations), we need to rethink the form of our data matrix. Recall that in the absence of such transformation, thematic text analysts use 'flat' two-dimensional data matrices in which each row (or unit of analysis) corresponds to a text block and each column (or variable) corresponds to a theme. Relational text analysts have developed two ways to flatten a collection of tuples into a matrix of rows and columns: Instead of having each column represent a type of theme, each of the columns represents a possible tuple (e.g., a unique SVO theme-combination); and instead of having each row correspond to a specific text block, each of the rows references an empirical tuple in the text. The former yields a network analysis in which tuple frequencies are variables, and the latter yields a semantic text analysis in which tuples are a unit of analysis.

A *network text analysis* can now be defined as a content analysis method in which each text block is characterized in terms of sets of relations among its themes. For example, let us imagine that we encode only causal relations in a sample of text blocks, ignoring all SVO tuples in which the verb (V) conveys something other than 'facilitates,' 'causes,' 'influences,' and the like. From each text block, we can then construct a network of themes in which all linkages indicate causal relations (*see* Models of Influence in Networks). We might then decide to measure a text block's 'causal salience' of theme A on theme B as the proportion of all sequences of causal linkages in the text block that are ones in which the former is the cause and the latter is the effect.

Figure 1 A network of causal relations among themes.

The simple three-theme network in Figure 1 is the graphic representation of causal relations in a text block that contains causal tuples consisting exhaustively of the same number of references to A causing B, A causing C, and C causing B. Note that the figure depicts four sequences of causal linkages, namely, A→B, A→C, C→B, and A→C→B. The causal salience of theme A on theme B thus equals .5, which is the proportion of the four sequences in which A is the cause and B is the effect. Rather than merely affording information on isolated tuples in the text block, it is worth noting that this measure incorporates information on all themes and links within the text block's network representation.

Table 1 illustrates a data matrix generated from networks – each corresponding to a randomly sampled text block – that exclusively contains causal salience measures on each pair of the texts' three themes. Many other measures of network characteristics have been developed. A theme's 'conductivity' is one example, referring to the number of linkages that the theme provides between pairs of other themes (Carley, 1997). Another measure is of theme linkages that are logically implied, but not explicitly stated in each block of text (Kleinnijenhuis et al., 1997). In each case, entire text blocks are assigned global measures that summarily reference all instances of a particular type of word relation.

A *semantic text analysis* is one in which every empirical tuple throughout the text that exhibits a specific type of semantic relation is characterized in terms of the words (or, more generally, themes) used in the respective parts of the relation. Semantics, not syntax, is referred to in this context because word relations with purely grammatical (i.e., syntactic) similarities may have quite disparate meanings (i.e., semantics). For instance, "Mary left an impression on Joe" may – depending on

Table 1 A data matrix from a network text analysis

3	13	34	61
4	10	35	61
5	16	29	44
⋮	⋮	⋮	⋮

the context – semantically reference a lingering thought or a painful indentation. Because content analysts generally are interested in words' meanings and not their superficial grammatical relations, each semantic text analysis begins with the construction of a template of semantic relations (also known as a semantic grammar). In the encoding phase, themes from sampled texts are mapped as components within this template. An example of this is Shapiro's and Markoff (1998) two-place semantic grammar for 'grievances,' which contains one syntactic component for the object of the grievance (i.e., what is being grieved about) and another for the action that should be taken toward this grievance.

Table 2 illustrates a data matrix that might have been generated in a semantic text analysis. Note that the cells in the matrix do not contain indicators of theme or tuple occurrences, but rather they contain discrete codes for the themes. The column in which a specific theme's code appears indicates the theme's role within the researcher's semantic grammar. In generating Table 2, clauses from a text population were encoded as sequences of subject–action–object triplets. Thus, for example, if 10 were the code for 'management official(s),' 34 the code for 'organize or arrange,' and 53 the code for 'conference or meeting,' the matrix's first row might be an encoding of the sentence, "Corporate leaders organized a meeting with union representatives for next week." Inferences from such a data matrix might be made to a population of newspaper accounts of labor disputes regarding the odds that representatives of management versus representatives of labor initiated collective bargaining. On the basis of semantically encoded transcriptions of speech from a random sample of minutes of prime-time television, inferences might be drawn from a similar matrix regarding the odds that blacks versus whites refer to themselves as objects of aggressive actions. More generally, semantic text analyses yield information on the frequency with which specific theme relations occur within the context of an a priori specified semantic grammar.

Researcher as Novice versus Expert

The American National Election Studies periodically includes a set of open-ended questions like the following:

> Now we have a set of questions concerning various public figures. We want to see how much information about them gets out to the public from television, newspapers and the like…. What about… John Roberts – What job or political office does he NOW hold?

As one of a series of 'political knowledge questions,' the correct (i.e., knowledgeable) answer to this question is "Chief Justice of the U.S. Supreme Court." Yet imagine that during an interview the response to this question is, "a job that he has performed worse at than any of his predecessors." At this point, a trained interviewer would recognize that the respondent has given not an incorrect but an inappropriate response to the question. In particular, the respondent mistakenly understood his role relative to the interviewer as one of expert regarding his own ideas rather than as novice regarding publicly available political knowledge. The point here is that interviewer and respondent must hold a consensus on who is expert and who novice regarding each survey question, leaving it the responsibility of the former to correct the latter when responses show these roles to have been reversed inappropriately.

Such 'correction activity' is impossible during secondary analyses of large (unresponsive) text populations, of course. If content analysts are to be consistent in their application of codes for themes and relations, they must self-consciously apply them in accordance with their status as novice or expert. For instance, when studying cultures, anthropologists typically adopt the role of 'humble novice,' thereby approaching documents and other materials with disinterested (i.e., non-prejudicial) interest in the meanings they imagine their sources to have intended. Archival texts themselves then become the ultimate touchstone in understanding why their authors thought and acted as they did. Yet the sorts of conclusions drawn by such a content analyst would undoubtedly differ from one who argued that the texts' authors "are unfamiliar with many fundamental properties of their own culture and prove unable to specify its structural rules…. (T)o recover culture's properties and rules, we cannot ask culture's participants to answer these questions. Instead, we must rely on outsiders as investigators and use their methods, however unreliable these may prove to be" (Namenwirth and Weber, 1987, p. 237). In sum, content analysts' stance as expert or novice respectively corresponds to their use of text analysis methods either to identify individual and societal characteristics about which society's members may be unaware, or to characterize texts in ways that their sources intended them to be understood (Shapiro, 1997).

To illustrate the disparate conclusions made by as-novice versus as-expert researchers, consider a small subpopulation of male novelists who write books only with elderly female heroines. In seeking to understand their choices of leading characters, the researcher-as-novice might scour the novelists' prefaces, possibly discovering references there to a need for elderly female heroines as a corrective to an overuse of young male heroes in contemporary literature. In contrast, a Freudian researcher-as-expert likely would find the choice of matronly heroines to be symptomatic of Oedipus complexes among the novelists. In the former case, the novelists' own meanings are assigned to their writings, whereas in the latter case, the researcher's (Freudian) perspective is applied.

Regardless of researchers' stance as novice or expert, they are always responsible for developing an explicit method to systematically apply the perspectives of sources or researcher in interpreting the texts under analysis. Methodological challenges related to as-novice text analysis are those associated with the researcher's ability to sympathetically understand the sources of his texts (*see* Ethnography; Qualitative Methods, History of). When researchers are capable of clearly articulating

their expertise, this latter approach has the advantage that it may be possible to fully automate the encoding process with text analysis software (e.g., Gottschalk et al., 2002). Software aides for the researcher-as-novice typically afford users with key-word-in-context (KWIC, or concordance) information so that themes and relations can be assigned with broader contextual information on sources' intended meanings (cf. the freeware, textual content analysis or TCA, referenced at the end of this article).

Inferences to Events versus Perspectives

In his grammatology, Jacques Derrida used the metaphor of a hinge to emphasize the 'dual life' of linguistic expressions. On the one hand, things people say or write are propositions that in varying degrees have a trace in the audience's sensory experiences. For example, a mother may find no trace of a 'freedom fighter' in the soldier who refers to her dead child as collateral damage. On the other hand, peoples' words are linked into a grammar. Thus, "gay marriage is wrong because (according to my sacred language's uncontestable grammar) marriage is between a man and a woman." Texts' dual life creates a methodological dilemma for the content analyst: If one is interested in using sources' narratives as windows into the *historical events* they experienced, then their perspectives are likely to distort these sources' rendering of the events. For example, members of conflicting groups may have noticed only their own but not other groups' attempts at reconciliation, making it difficult to discern from their writings which attempts had in fact been made. Yet if one wishes to investigate differences among *sources' perspectives*, then their responses to historical events may be mistaken for changes in perspective. Accordingly, autonomous competitors within an impersonal marketplace may temporarily 'become' patriotic members of a national civil society in reaction to a terrorist event. In brief, inferences from texts to historical events will be compromised to the extent that sources' perspectives are confounded with their renderings of facts, and inferences from texts to sources' perspectives will be compromised to the extent that historical events are confounded with the perspectives they adopt (succinctly put, perspectives constitute 'noise' when inferring events and events constitute 'noise' when inferring perspectives).

One way of managing this 'noise' is to include it as a measured component of the research design. When establishing facticity, researchers commonly attenuate the effects of sources' perspectives by comparing (triangulating [*see* Triangulation: Methodology]) their inferences with other event-related records. Events themselves may be used as contextual variables between which perspectives may be compared. Yet despite such strategies, the methodological challenge remains that content analysts must decide not only whether they are researching events or perspectives, but also how they are to attenuate the noise introduced by the 'other life' of the linguistic expressions being analyzed. The next two paragraphs illustrate relational text analyses in which inferences are respectively (and exclusively) drawn about events and perspectives.

Conflict resolution between nations is most effective when 'sticks' (i.e., conflictual actions) are directed toward both antagonistic parties at the same time that 'carrots' (i.e., cooperative actions) are directed toward the weaker antagonist. Schrodt and Gerner (2004) provide evidence in support of this proposition based on event data gleaned from Reuters News Service lead sentences in coverage of the Israel–Lebanon and Israel–Palestinian (1979–99), plus Serbia–Croatia and Serbia–Bosnia (1991–99) conflicts. In their analysis, frequencies of cooperative behavior between a mediator (United States, United Nations, or European Union) and either antagonist, and conflictual behavior either between antagonists or between mediator and antagonist were compared over time. In a time-series analysis, decreased frequency in reports of inter-antagonist conflict is associated with prior instances of the sticks and carrots. In this way, a content analysis of texts from a news service affords data on the timing and substance of political events at the close of the twentieth century.

When pressed for clarity on what is meant by 'socially constructed reality,' sociologists typically assert that such construction is accomplished rhetorically (i.e., via persuasive communications). Yet surely an argument that is persuasive in one culture might not make sense (i.e., lack rhetorical purchase) in another. For example, Roberts et al. (2010) provided evidence of statistically significant differences between Arab and Hindi cultures in how 'possibilities' are depicted in Saudi and Indian editorialists' rhetorical use of modal auxiliary verbs, such as 'want' and 'can.' Whereas Arabs tend to justify their wants, hopes, and attempts in normative ways, Hindi authors write about what they 'can' do in accordance with their natures – rather than their desires – as required by the circumstances at hand. This content analysis affords not only data on perspectives (not events) but also findings consistent with two distinct ways of socially constructing personhood, namely, by rhetorically characterizing people either as willfully striving to emulate quranic norms or as unwilled performances enabled by their respective natures.

What Questions Can Content Analyses Answer about Text Populations?

No discussion of content analysis would be complete without an emphasis on the fundamental importance of contextual variables (i.e., variables not obtained directly from the texts but variables indicating other characteristics uniquely associated with each text block under analysis). Notice how text-related variables become interesting only when compared between historical periods (of mediation vs. conflict events), cultures (Arab vs. Hindi), media (television vs. Internet), sources (male vs. female), and the like. Contextual variables allow the researcher to test hypotheses (or speculate exploratively) about why words were used and related as they are in a text population.

Beyond which contextual variables to consider, content analysts must make equally important decisions about the texts themselves. Because every content analysis of texts involves a researcher in the 'interrogation' of a text population, it is imperative that researchers spell out precisely what questions their encoding process will answer about the texts. First, is the analysis only to report which themes were discussed, or is information on the texts' word relations to be reported as well? Second, if word relations (or tuples) are of interest, are the tuples to be

treated jointly as networks of text block characteristics or as discrete instances of a semantic grammar? Third, are researcher's or sources' meanings to be assigned to the texts? And, finally, are the texts to be used as 'windows' either into events experienced by the texts' sources or (exclusively) into the perspectives sources brought to these experiences? Responses to these questions yield 12 distinct approaches to text analysis (thematic/network/semantic × as-expert/as-novice × events/perspectives), resulting in a vast array of possible content analysis techniques and applications (Roberts, 1997; Krippendorff and Bock, 2008). Yet the appropriate method for individual research is greatly simplified once one stops asking, "How are texts analyzed?" and instead addresses the four questions discussed in this article. After setting the parameters of content analysis in this way, guiding the analysis's substantive direction is where the researcher's own imagination takes hold.

This article is reproduced from the previous edition, volume 4, pp. 2702–2705, © 2001, Elsevier Ltd., with revisions made by the Editor.

Abstract

This article reviews the process of obtaining logical and empirical evidence by evaluating test content in relation to a defined domain of knowledge or performance. After considering some historical background, it explains the steps required for content validation: domain definition, judgment process, selecting and training judges, and data analysis from content judgment studies. It concludes by asserting the evolving standards for content validation.

Content validation is the process of obtaining evidence to support test use in the form of expert judgments about test content in relation to a defined domain of knowledge or performance (Krippendorff, 2013). Developers of educational achievement tests, personnel tests, and tests of licensure and certification often rely on evidence from content judgment studies. Definitions of content validity have appeared in measurement literature since the 1950s, but some theorists have questioned whether it qualified as a form of validation. Content judgment studies involve defining domain, identifying features of items to be reviewed, structuring the review process, selecting and training qualified experts, and collecting and summarizing the data from their judgments. The judgment process focuses typically upon relevance of item content to the domain, balance of coverage or representativeness, and technical quality of items. Ratings of frequency and criticality are often used to operationalize the concept of relevance. A variety of methods have been used for analyzing data from content judgment studies. Standards for evaluating the psychometric quality of content judgment studies are traced through five editions of the *Standards for Educational and Psychological Tests*, 1954–99.

Validation is a process of disciplined inquiry. In the social sciences, it entails the systematic assembly of logical and empirical evidence to support the intended use of the test scores. Content validation is the process of obtaining such evidence in the form of expert judges' evaluation of test content in relation to a defined domain of knowledge or universe of behavior. Suppose an examinee takes a test of foreign language proficiency and must translate sentences and identify the meaning of vocabulary words. The test user wants to draw inference from performance on the test items at hand to a broader universe of behavior represented by these tasks. Practical constraints of testing time, examinee fatigue, examinee motivation, and cost of item development limit the number of items on the test. Thus, these items and response formats must represent a hypothetical pool of tasks that could have been presented covering the same content. Validity arguments for this inference hinge largely on whether a clear domain of language proficiency was defined and how adequately this domain was sampled by the exercises.

Using expert judges to review the domain description and evaluate specific features of the items in relation to this domain, as well as collecting and summarizing their judgments, is known as content validation. Content validation evidence is useful in (1) assessment of educational achievement, (2) assessment of job knowledge or skills by employers, and (3) professional certification and licensure testing. It may also play a role in establishing construct validity of instruments for assessing affective traits.

History and Terminology

Attempts to define content validity were prominent in the measurement literature in the mid-twentieth century (Ebel, 1956; Gulliksen, 1950; Lennon, 1956). From the 1950s to 1980s, measurement experts (e.g., Cronbach, 1971) identified three distinct approaches to validation: (1) content validation, (2) criterion-related validation, both predictive and concurrent, and (3) construct validation. Throughout this period, however, a few theorists continued to challenge whether content judgment studies fit within the definition of validation (e.g., Fitzpatrick, 1983; Messick, 1975), but this view was not dominant.

Originally, content validation was applied primarily in educational achievement testing. Clearly, the usefulness of test scores as indicators of student learning depended upon the linkage between items presented in the test and the body of knowledge that the items sampled. The 1970s witnessed a growing trend for personnel psychologists to employ content validation to justify the use of test results in personnel selection and advancement decisions, despite some notable reservations (Ebel, 1977; Fitzpatrick, 1983; Guion, 1977). This application grew in inverse proportion to waning confidence in the adequacy and legal defensibility of other validation procedures for many jobs and employment settings. Licensing and certification testing also relied on content validation throughout this period (Shimburg, 1982).

Approaching the twenty-first century, a more unitary view of validity prevailed (Messick, 1989). One theme of this perspective is that proficiency in an academic subject or job performance domain should be viewed as a construct. Although not new, the idea gained mainstream acceptance. From this viewpoint, all validation efforts are designed to provide evidence of construct validity, but there are multiple aspects to the process of construct validation (and multiple types of evidence). Content is consistently the first aspect and

involves determination of the construct relevance, representativeness, and technical quality of the test using expert judgment (Messick, 1995; García-Valderrama and Mulero-Mendigorri, 2005).

Other terms are associated with content validity, but not synonymous. 'Face validity' is the extent to which items appear relevant to a trait in the eyes of laymen or examinees who are not necessarily experts in the subject tested (Mosier, 1947). 'Instructional validity' and 'curricular validity' were spawned in the mid-1970s during landmark litigation over the use of high-school competency examinations in Florida (see Yalow and Popham, 1983). Curricular validity refers to congruence between item content on an achievement and curricular objectives and textual materials. Instructional validity refers to congruence between item content and instruction from teachers.

Design of a Content Judgment Study

Content judgment studies typically are undertaken by test developers as part of their initial validation effort for a new test of knowledge or proficiency. Test users may also conduct local content validation prior to the decision to adopt an existing, published test. These studies may require replication over time to demonstrate that changes in curricula or job requirements have not undermined the meaning of the test scores. A content judgment study involves systematic collection of observations. Steps in the process may include:

1. Specifying the questions to be addressed
2. Defining the domain of interest
3. Identifying the features of the exercises to be examined in the judgment process
4. Developing a structured framework for the review process
5. Selecting qualified experts for that domain
6. Instructing the experts in the review process
7. Collecting and summarizing the data

Domain Definition

With achievement tests, domain definition typically is extracted from instructional objectives commonly used by those who teach the subjects; review of curricular materials and published textbooks also may play a central role in domain definition. Interviews or surveys of instructors have also been used in this process (see Yalow and Popham, 1983). Test specifications (blueprints), used by test developers to maintain the desired proportional coverage of various content areas and cognitive performance levels, may also be used in domain definition. In personnel or licensure testing, domains, or required or prerequisite knowledge, may be defined through a detailed job description provided by experts or a job analysis based on detailed observations of individuals performing the job (Kane, 1997); however, in licensure testing the domain is restricted typically to skills and knowledge that are essential to public safety (Smith and Hambleton, 1990). A 'critical incidents' technique may also be employed to capture important knowledge or skills that spell the difference between successful and failing job performance. Thorough domain definition also includes the format(s) in which individuals may be expected to display their knowledge: that is, it covers both a stimulus and a response domain (Guion, 1977).

The Judgment Process

The judgment process focuses upon at least three features of the test items: (1) relevance of item content to the domain; (2) balance of coverage or the extent to which the collection of items adequately sample the content domain; and (3) technical quality of the items, response formats, and scoring procedures (Messick, 1989, 1995).

Relevance of item content is assessed by evaluating the importance of the knowledge or skills required to answer the test item in relation to successful performance in the domain. Judges may be asked to rate frequency and criticality of the skill or knowledge tapped by the exercise. When the domain is complex, the study may involve having a sample of experts (1) evaluate the appropriateness of the objectives or list of behaviors that comprise the domain and (2) match exercises to those objectives.

Representativeness (balance of coverage) is ascertained by having the judges review the entire test to identify areas of the domain that may be over- or underrepresented. It is possible for all items on a test to be relevant when reviewed individually but yet for the coverage of the domain to be disproportionately limited to only a few objectives or skills. A mathematics test, for example, might stress computational skills but place little emphasis on problem-solving, even though both skills are stressed in the curriculum. The proportions of items matched to each objective or job behavior are examined to assess appropriateness of coverage. The format for examinee response to exercises may also be considered in evaluating representativeness. In judging technical quality of exercises, experts attend to features of the question, response format, scoring rubrics or keys, and administration and scoring instructions that might interfere with examinees' ability to display their knowledge of the correct response.

Selecting and Training Judges

Judges' qualifications and the overall representative nature of the panel of judges in terms of demographic characteristics and educational/professional backgrounds are important issues in the design of a credible content validation study. The instructions given to the judges and training they receive before undertaking their review should also be planned and documented. Finally, in large-scale content validations, level of agreement across the panel is useful information.

Analyzing Data from Content Judgment Studies

Thorough content validation studies yield substantial amounts of data. Each item should have a record containing multiple judges' ratings for each feature of the item that was reviewed.

Marshalling these data for analyses to summarize results at the individual item level and for the total test requires forethought. At the simplest level, indices such as percentage of items classified to objectives may be computed and reported. Judges' mean ratings for each item and over the test as a whole on frequency or criticality may be computed. More sophisticated treatments of data from content validation studies also have been suggested. Crocker et al. (1989) described various quantitative indices used in content judgment studies, including measures of (1) overall fit between test and curriculum, (2) degree of fit for individual items to content domain, (3) fit between test specifications and examinee performance, and (4) error estimation in judges' ratings. In addition, new technical approaches to analyzing job analysis data are emerging (e.g., Kane, 1997; Sireci and Geisinger, 1995; Penfield and Miller, 2004; Rourke and Anderson, 2004).

Evolving Standards for Content Validation

Standards for evaluating test development and use have been articulated since the 1950s by a series of joint committees of the American Association of Educational Research, the American Psychological Association, and the National Council on Measurement in Education. These standards have received global recognition. In the first published committee report, each recommendation was labeled as ESSENTIAL, VERY DESIRABLE, or DESIRABLE (APA, 1954: p. 20). The primary recommendation for content validation was as follows:

> If a test performance is to be interpreted as a sample of performance in some university of situations, the manual should indicate clearly what universe is represented and how adequate the sampling is.
> ESSENTIAL

Additional recommendations included that the descriptions be provided for sources of items, criteria for inclusion or exclusion of items, and method of sampling items from the domain. A decade later, the *Standards* (APA, 1966) specified that content validity information should include the following:

1. The universe that the test items represented (ESSENTIAL)
2. The adequacy of the procedure for selecting a sample of items from the universe (ESSENTIAL)
3. The dates of publication of any textbooks from which items' topics were selected (ESSENTIAL)
4. The professional qualifications of the expert judges (VERY DESIRABLE)
5. The directions that they received (VERY DESIRABLE)
6. The extent of agreement among judges (DESIRABLE)
7. Any classification or taxonomy used in item selection (DESIRABLE)

The next edition of the joint standards (APA, 1974) generally upheld the previous standards for content validity but recognized increasing applications of content validation in personnel selection:

> When a test is represented as having content validity for a job or class of jobs, the evidence of validity should include a complete description of job duties including relative frequency, importance, and skill level of such duties.
> ESSENTIAL. (p. 46)

In 1985, the joint *Standards* downplayed the notion of 'content validity' as a separate test quality but recognized the uniqueness of its form of evidence (AERA et al., 1985). In addition, these standards covered domain definition and content validation for licensure testing. The final edition published in the twentieth century (AERA et al., 1999) includes two standards for validity evidence from content judgment studies. First,

> When the validation rests in part on the appropriateness of test content, the procedures followed in specifying and generating test content should be described and justified in reference to the construct the test is intended to measure or the domain it is intended to represent. If the definition of the content sampled incorporates criteria such as importance, frequency, or criticality, these criteria should be clearly explained and justified.
> (p. 18)

Second,

> When a validation rests in part on the opinions or decision of expert judges, observers, or raters, procedures for selecting such experts and for eliciting judgments or ratings should be fully described. The qualifications, and experience, of the judges should be presented. The description of the procedures should include any training and instructions provided, should indicate whether participants reached their decisions independently, and should report the level of agreement reached. If participants interacted with one another or exchanged information, the procedures through which they may have influenced one another should be set forth.
> (p. 19)

Shifts in wording and focus of criteria for evaluating content judgment studies reflect trends in the measurement community's view of validity per se. Yet, given advances in the theory, quantitative models, and technology of modern psychometrics, it is remarkable that the underlying logic, methods, and criteria for content judgment studies have survived with so little change. Evidently, the concept possesses enduring utility for a broad range of test developers and test users.

Context Dependent Memory

Abstract

The study of the effects of environmental context for animal learning and human memory has a long history with mixed results. This research is reviewed to determine the conditions in which environmental context influences memory performance and the nature of these effects. Both interference and context reinstatement paradigms are considered. Global environmental context has a more reliable effect on free recall performance, whereas more local manipulations of context have more consistent effects on recognition memory. Context-dependent recognition is reliably observed, whereas context-dependent discrimination depends on the encoding of specific item–context associations. The neural bases of context effects are also reviewed.

> An experience can be recalled most readily in those environmental situations with which it has the most direct, the strongest, and most numerous associations. (Carr, 1925: p. 251)

In episodic memory, both the initial encoding and later retrieval of an event occur in contexts. As the above quote aptly illustrates, it has long been assumed that retrieval will be optimal when it occurs in the same context that was present at encoding and can be adversely affected when the context is changed. Assumptions regarding the effects of context on memory are consistent with Tulving's (1983) (Tulving and Thomson, 1973) encoding specificity principle, which states that memory improves to the degree that the information in the retrieval environment matches the information that was encoded at the time of study. Smith (1988) provides illustrative anecdotal examples of past memories that are brought to mind when one returns to a previously familiar place after an absence and notes that context can serve as an organizational cue for information associated with different contextual referents.

The effects of context on memory have been shown in both studies of animal learning (e.g., Carr, 1917; see Spear, 1978 for a review) and human memory (e.g., Dulsky, 1935; for reviews see Smith, 1988 and Smith and Vela, 2001). Context has been broadly defined and has included the physical environment (Godden and Baddeley, 1975; Smith et al., 1978), including factors such as odors (Cann and Ross, 1989; Schab, 1990), background music (Smith, 1985a), body posture (Rand and Wapner, 1967), drug-induced (Eich, 1980) and mood-induced (Bower et al., 1978; Eich and Metcalfe, 1989) states, influences on the semantic interpretation of events, (such as the response 'jam' rather than 'traffic' in response to 'strawberry') (Light and Carter-Sobell, 1970), and even the specific script in which words are typed (Reder et al., 2002).

Considering context in such broad terms has made defining context and distinguishing context from the to-be-remembered target event, somewhat problematic. Researchers have proposed several distinctions concerning the relation between the context and the target information that can influence or moderate the effects of context on memory: (1) context can be global or general and associated with a number of items or be local or specific to one or a few target items (Dalton, 1993; Glenberg, 1979); (2) context can be encoded incidentally or without intention to do so or be encoded intentionally with the target event (Smith and Vela, 2001); and (3) context can be independent from the target items or can be associated or integrated with the to-be-remembered information (Baddeley, 1982; Eich, 1985; Murnane et al., 1999).

This article will focus on the effects of physical or environmental context (EC) on memory because this type of context has played an important role in different theories of memory (e.g., Gillund and Shiffrin, 1984; Humphreys et al., 1989; Tulving, 1983) and in the applied aspects of memory research such as eyewitness memory (e.g., Dando et al., 2009), and because much more research has investigated this aspect of context. Historically, researchers have used rooms with different physical features to evaluate the effects of EC, but more exotic physical environments have also been contrasted, such as underwater versus on land (Godden and Baddeley, 1975) or on a boat (Emmerson, 1986). Early laboratory-based experiments used such improvised manipulations as background color (Dulsky, 1935; Weiss and Margolius, 1954), and having participants stand with their heads in oddly shaped boxes with flashing red and green lights (Dallett and Wilcox, 1968). More recent manipulations on computer screens have involved different colors and locations (Murnane and Phelps, 1993), background pictures of scenes (Hockley, 2008a), scenes viewed through LCD glasses (Hockley et al., 2012), and video recordings of real-life environments (Smith and Manzano, 2010). Somewhat surprisingly, the nature of the background or incidental context manipulation has not greatly influenced the qualitative pattern of the observed effects. The magnitude of the effect of context, however, has tended to be greater for more detailed or engaging manipulations (Hockley et al., 2012). For example, Murnane et al. (1999) showed that context effects for recognition memory were much greater with backgrounds that were perceptually and semantically richer compared with much simpler manipulations of color and location, and Smith and Manzano (2010)

obtained very large effects of context on recall performance using video backgrounds.

Two different experimental procedures have been used to examine context-dependent memory: interference paradigms and what Smith and Vela (2001) termed the reinstatement paradigm.

Interference Paradigms

Early studies of context-dependent memory in humans were carried out to test assumptions of the interference theory of forgetting (Postman and Underwood, 1972). This theory proposes that forgetting is due to proactive interference from prior learning and retroactive interference from later learning. In the interference paradigm, the to-be-remembered material is learned in one context and interfering stimuli are learned in either the same or a different context. As was typical of the period, experiments involved learning and relearning of paired-associate or serial lists of words or nonsense syllables. Although there were some exceptions (Nagge, 1935; Strand, 1970), several studies showed evidence of context-dependent memory: The effects of both proactive interference (Dallett and Wilcox, 1968) and retroactive interference (Bilodeau and Schlosberg, 1951; Eckert et al., 1984; Greenspoon and Ranyard, 1957) were significantly reduced when the interfering material was learned in a different context than the target information. Similar results have been found in nonhuman animal studies. For example, Zental (1970) observed reduced retroactive interference in spatial discrimination in rats by providing different contextual cues during the learning of two tasks.

Another phenomenon related to interference effects in associative learning which demonstrates context-dependent memory and that has been shown for both nonhumans and humans is the 'renewal effect.' This effect occurs when a change in context between extinction and test restores (or renews) the original conditioned response (Bouton and Bolles, 1979; Bouton et al., 1999). In the basic AAA/ABA context procedure demonstrating the renewal effect, subjects first learn a cue–outcome relationship in one physical context (A). This cue–outcome relationship is then extinguished by presenting the cue without the outcome in either the same context (A) or a different context (B). A final test is typically conducted in the original context (A). The renewal effect is seen as a recovery of the cue–outcome association, when the extinction was in a different context (B) compared with the situation when acquisition, learning, and test all took place in the same context (A).

The renewal effect is of particular interest because research has shown that the original learning is not context dependent. That is, the original cue–outcome association is quite robust and can be seen when tested in different contexts prior to extinction. Rather, the renewal effect is due to the context-specific nature of extinction. By way of explanation, it has been suggested that the meaning of the cue becomes ambiguous during extinction, leading subjects to pay more attention to the context (Bouton, 1997). Rosas et al. (2006) further suggested that when subjects pay attention to the context, all learning in that situation is associated with that context.

The Reinstatement Paradigm

The reinstatement paradigm has been, in recent years, the most commonly used method to examine context effects. In this procedure, participants study material in one environment, and evidence for context dependence is observed when memory is greater when the context is reinstated at test, as compared with when it is changed. Undoubtedly, the most cited study using this paradigm in natural environments is Godden and Baddeley (1975). They had divers study and recall lists of words either underwater or on land. Recall was greater when study and test were in the same physical environment and suffered when the contexts were different. The pattern of the interaction demonstrating the global EC context effect for recall found by Godden and Baddeley (1975) and many others is exemplified in **Figure 1**.

In a later study, Godden and Baddeley (1980) failed to find such an EC effect when they tested recognition memory rather than recall. Emmerson (1986), however, did find a modest EC effect for recognition in a replication of Godden and Baddeley's (1980) study. While several studies using different rooms as the context manipulation have found an EC effect for recognition (Dalton, 1993; Geiselman and Bjork, 1980; Geiselman and Glenny, 1977; Smith, 1986; Smith and Vela, 1992), a number of others have not (Fernandez and Glenberg, 1985; Jacoby, 1983; Smith, 1986; Smith et al., 1978). The literature appears to suggest that it is easier to observe EC effects for recall than for recognition, but there have been failures to find EC effects in tests of recall as well (e.g., Eich, 1985; Saufley et al., 1985). Fernandez and Glenberg (1985) reported eight failures to find an EC effect and questioned the reliability and robustness of this effect using standard manipulations of EC. Why would EC effects, particularly in tests of recognition, show such inconsistency? Several explanations have been proposed.

Factors Affecting Context Effects

Overshadowing, outshining, and mental reinstatement have all been suggested as possible reasons to explain failures to find EC effects.

Figure 1 A representation of the interaction between the learning environment and the retrieval environment showing that recall is greater when the study and test environments are the same.

Overshadowing

If the encoding of context information was inhibited or otherwise interfered with at study, no effects of context would be observed. For example, if participants were given the task of making associations between pairs of study items, it might inhibit or greatly reduce the incidental encoding of contextual information or associations between study items with contextual features. As Smith and Vela (2001) noted, associative processing between study items was involved in seven of the eight experiments that did not show CE effects, as reported by Fernandez and Glenberg (1985).

Outshining

According to the outshining hypothesis (Smith, 1988), context effects will be attenuated or eliminated to the extent that effective noncontextual cues are available at test to guide retrieval. In this view, CE effects should be greatest for free recall, reduced for cued recall, and reduced further for recognition, as the cues provided in cued recall and recognition tests will typically be more effective than contextually based cues.

Mental Reinstatement

Research has shown that instructions to imagine or bring back to mind a previous context can improve recall (Dando et al.,2009; Smith, 1979, 1984) and recognition (Krafka and Penrod, 1985; Malpass and Devine, 1981). Such instructions are now part of the 'cognitive interview' that was developed by Fisher and Geiselman (1992) to improve eyewitness memory. If participants being tested in a changed context mentally reinstated the study context, the context manipulation would be compromised and the chances of observing the effects of EC would be substantially reduced.

Smith and Vela's (2001) Meta-Analysis

In a meta-analysis based on 75 experiments from 41 articles that examined incidentally encoded global EC effects in human memory, Smith and Vela (2001) showed that overall EC effects in the reinstatement paradigm were reliable. This analysis also provided evidence that overshadowing and mental reinstatement can attenuate context-dependent memory. The evidence in support of the outshining hypothesis was mixed, however, as the predicted difference in EC effects for free recall and recognition was not found. Averaged over studies, the effect sizes were similar in magnitude and greater than zero for free recall and recognition, with effect sizes falling within Cohen's (1988) small effect range, whereas the effect size associated with cued recall did not differ significantly from zero. Dougal and Rotello (1999) also found no support for another prediction of the outshining hypothesis, as the EC effect in recognition was not reduced when the target item was strengthened.

In response to the apparent inconsistency of EC effects in tests of recognition, there was a shift from using what Fernandez and Glenberg (1985) termed 'standard methods' that were predominantly global in nature to more local-based manipulations of context. The influential work of Murnane and Phelps (1993, 1994, 1995) exemplified this approach and led to the distinction between context-dependent recognition and context-dependent discrimination (Murnane et al., 1999).

Context-Dependent Recognition and Context-Dependent Discrimination

To minimize the possibility (and utility) of mental reinstatement of the study context, researchers used multiple contexts at study and test (Bjork and Richardson-Klavehn, 1989; Smith, 1979, 1985b). As Smith has shown, mental reinstatement becomes more difficult when multiple contexts are used both in tests of recall (Smith, 1979) and recognition (Smith, 1985b). Note that in using multiple study contexts rather than one, the context manipulation changes from global (many items in one context) to local (fewer items in each context) in terms of Dalton's (1993) dichotomy.

Murnane and Phelps (1993, 1994, 1995) presented lists of words in different computer screen locations and in different foreground and background colors. For the recognition tests, items were presented in their original study context or a new context consisting of contextual elements not seen at study. They found that both the hit rate (proportion of correct old responses) and the false alarm rate (proportion of incorrect old responses) were higher for items tested in their old context compared with a new context. The increase in the hit and false alarm rates was similar or concordant, and thus there was no overall difference in discrimination (the ability to distinguish old from new test items) between the reinstated and changed context conditions. Murnane et al. (1999) termed this concordant effect context-dependent recognition. Context-dependent recognition was found when test items were presented in an old context configuration that was paired with a different item at study, that is, a 'rearranged old context' (Murnane and Phelps, 1994), and also when a test item was presented in a new configuration of old context elements (Hockley, 2008a: Exp. 1). These results indicate that the elements of these simple contexts were not bound together and were not specifically associated with the study item. The results of Hockley (2008a: Exp. 2) depicting context-dependent recognition are shown in the top panel of **Figure 2**.

In a different manipulation of context on a computer screen, Murnane et al. (1999) presented the study words on a chalkboard in a classroom scene, on a television in a living room, on a sign on a desert road, and on a banner trailing from an airplane. A different fifth scene was used as the new context condition at test. In contrast to context-dependent recognition found by Murnane and Phelps (1993, 1994, 1995) for simple context backgrounds, Murnane et al. showed that more semantically meaningful contexts resulted in better recognition accuracy for items presented in their original study context at test, a result they termed context-dependent discrimination. The results of Hockley (2008a: Exp. 5B) illustrating the pattern of context-dependent discrimination are shown in the lower panel of **Figure 2**.

Figure 2 Mean hit rates (HR; correct old responses), false alarm rates (FAR; incorrect old responses), and corrected recognition scores (CRS; CRS equals HR minus FAR and provides a measure of discrimination) for context-dependent recognition (top panel; Hockley, 2008a: Exp.2) and context-dependent discrimination (bottom panel; Hockley, 2008a: Exp. 5B).

The ICE Model

Murnane et al. (1999) developed a global matching model, ICE (item, context, and ensemble information), to account for context-dependent recognition and discrimination. In global matching models, the information in the retrieval environment is matched with all information in memory and recognition is based on the overall strength or familiarity value associated with the degree of this match. Murnane et al. proposed that context information encoded at study and reinstated at test would increase the familiarity value associated with the test item. A target item presented in the same context at study and test would have a high degree of familiarity, because both item and context information would match the information stored in memory. A target presented in a new context at test would have a lower degree of activation because only the item itself would match the information stored in memory. Thus, context-dependent recognition would be observed when a test item is presented in an old context compared with a new context, because the old context will increase the familiarity associated with an old or a new test item. Context-dependent discrimination, however, is the result of an additional source of information. If item and context information are associated or integrated at encoding, this ensemble information provides an additional source of information that can further boost the familiarity of old items, but not new items, at test. Ensemble information, when it is encoded, produces a discrimination advantage for old items tested in their original study context.

The ICE model of Murnane et al. (1999) is based on the assumption that recognition is familiarity based. More recently, a number of researchers have argued for a dual-process view of recognition memory (see Yonelinas, 2002, for a review). In this view, recognition can be based on recollection of specific details of a prior event or on familiarity in the absence of recollection. Macken (2002) proposed a dual-process account of context-dependent discrimination.

Familiarity versus Recollection

Macken (2002) supplemented Murnane and Phelps' (1993) background and foreground color context manipulation with Tulving's (1985) subjective remember–know response procedure. In this procedure, participants classify their old recognition decisions as being based either on the recollection of specific details of the prior presentation (remember) or on a strong feeling of familiarity in the absence of recollection of any specific details (know). Macken found that context-dependent discrimination was associated with 'remember' but not with 'know' decisions and argued that EC effects are due to the encoding and retrieval of specific item–context associations. This view is also consistent with research showing that while not all recollection is based on the retrieval of context information, participants are much better at making contextual judgments about items they claimed to recognize on the basis of recollection than they are for items deemed familiar (Perfect et al., 1996).

Not all studies, however, have found a clear relationship between EC effects and remember–know responses. Hockley (2008a), for example, did not find context-dependent discrimination for remember responses using different background pictures of scenes as the context manipulation when context was encoded incidentally. In contrast, Gruppuso et al. (2007) found a large EC discrimination effect

for 'remember' responses but not for 'know' responses, following a study task in which participants rated the degree to which the target faces matched their picture contexts. As Macken (2002) noted, the dual-process view of context-dependent discrimination provides an explanation as to why EC effects are not always observed in tests of recognition. As EC effects are dependent on conscious recollection of item–context associations, they will only be found in tasks or conditions that support the encoding and retrieval of these associations.

Research has shown that the retrieval of specific associations becomes more difficult as the number of associations between different targets and the same cue increases, due to the interference between the competing associations (i.e., 'the fan effect'; Anderson and Reder, 1999). It follows that increasing the degree of fan of the context, or the number of associations between target items and the same context, will diminish the memorial benefits of context reinstatement. This is exactly what has been found in tests of recognition (Reder et al., 2002, 2013; Rutherford, 2004) and free recall (Hockley et al., 2012; Exp. 3; Smith and Manzano, 2010), providing further support for the view that the memorial benefits of EC are the result of specific item–context associations. In contrast, no effects of contextual fan have been observed for context-dependent recognition (Hockley, 2008a; Murnane and Phelps, 1993), which is to be expected if specific item–context associations have not been encoded. A variety of factors can influence the encoding of such associations including the nature of the context and the to-be remembered stimuli and whether or not the context is part of the focus of attention.

Nature of the Context and the Target Stimuli

Memorable context manipulations such as random photographs of scenes may produce large context-dependent recognition effects, but might not be very amenable to the encoding of item–context associations that give rise to context-dependent discrimination under incidental encoding conditions (e.g., Hockley, 2008a). In contrast, context-relevant scenes would be more likely to promote the integration of the target items and their context (e.g., Murnane et al., 1999). It is also the case that EC effects vary with the nature of the to-be-remembered stimuli. Many studies, particularly early in the study of EC effects, used words as the target information. More recently, other types of stimuli, such as photographs of unfamiliar faces, have been used with mixed success (e.g., Dalton, 1993; Gruppuso et al., 2007; Reder et al., 2013; Russo et al., 1999). The ease of encoding item–context associations, and the susceptibility to interference of these associations, will vary depending on the nature of the context and the target stimuli involved.

Incidental versus Intentional Encoding of Context

Context-dependent recognition is a robust phenomenon that has been observed with a variety of stimulus manipulations under incidental encoding conditions. It has been found with intact and rearranged combinations of background and foreground screen colors (Hockley, 2008a: Exp. 1; Macken, 2002; Murnane and Phelps, 1993, 1994), background pictures of scenes (Hockley, 2008a: Exp. 2; Hockley et al., 2012: Exp. 1) and background pictures at test that are physically and categorically similar to the background pictures at study, such as different pictures of sunsets and the Grand Canyon (Hockley, 2008a: Exp. 4). The fact that context-dependent recognition has also been found in two-alternative, forced-choice recognition (Hockley et al., 2012: Exp. 2) indicates that it is largely a familiarity-based phenomenon and not solely due to a response bias that classifies stimuli as old when they are shown in an old context, although response bias may also play a role (Feenan and Snodgrass, 1990). Target stimuli presented in an old context, or in a context that is similar to an old context, are associated with a greater sense of familiarity than tests presented in a noticeably different context.

Context-dependent discrimination, however, has been more elusive when encoding is incidental. The influence of context on recognition discrimination can be assessed by comparing performance for old items tested in their original or intact study context with old items tested in a rearranged, old context. A rearranged, old context condition controls the familiarity of an old context, but the rearranged context is not associated with the target item. Under incidental encoding conditions, this comparison typically yields trends towards greater accuracy in the intact context condition that often fall short of statistical significance (e.g., Hockley, 2008a; Hockley et al., 2012; Murnane and Phelps, 1994).

Much larger EC effects can be observed when attention is directed to the context as well as the target item. As examples, context-dependent discrimination was observed by Winograd and Rivers-Bulkeley (1977) when participants rated pairs of male and female faces in terms of their compatibility as a couple, by Gruppuso et al. (2007) who instructed participants to rate how well target faces matched their picture contexts and by Hockley (2008a: Exp. 5B) when participants rated how easy it was to associate the target word with the background scene. Such study tasks involve the processing and encoding of associative information that links the context and the target item. Similarly, when the context information is meaningfully related to the target item, it will also be processed with the target information. This was the case when Murnane et al. (1999) presented their target words in such relevant contexts as on a blackboard in a classroom, and when Vakil et al. (2007) examined recognition of faces that were presented in the context of hats that were characteristic of different occupations, such as a firefighter's helmet or a cook's cap.

Lucke et al. (2013) have recently demonstrated that the magnitude of the influence of context in the renewal effect also depends on whether the context was or was not relevant in a task where human participants were required to predict the occurrence of specific outcomes on the basis of different cues. Extinction was faster and response recovery was greater in the condition where context was task relevant. An analysis of eye movements further showed that the dwell times of eye gazes were longer on context stimuli when they were task relevant.

As in the case of the dwell times of eye gazes, mean response time has been shown to be a sensitive measure of cognitive performance generally, and of memory in particular (see Hockley, 2008b). Rutherford (2004) measured response time of recognition decisions when context was manipulated by background screen color. Hit rates were greater in the same than in the changed context condition, and in one of two experiments, response was also faster for hits in the same context condition. Hockley et al. (2012) analyzed response time in a recognition experiment where context was manipulated by presenting study words against different picture backgrounds. The new context condition at test was a blank background. In addition to replicating the context-dependent recognition effect, they found that response time was slower when old or new tests were shown in an old study context compared to the new (blank) context condition. Thus, even though context was incidental to the task of remembering the words, participants did spend appreciable time viewing the background context.

Smith and Vela (2001) noted the importance of examining the effects of the incidental encoding of context for theoretical, empirical, and applied reasons. It seems obvious that the incidental encoding of context information would have much more modest effects on memory performance than when contextual associations are encoded in a more directed or intended fashion. The intentional encoding of context, however, may provide a better laboratory analogue of the representation of contextual information that accrues incidentally with repeated experiences in real-life situations. This is what Gruppuso et al. (2007) attempted to demonstrate in their experimental analogy of Mandler's (1980) well-cited example of having a strong sense of familiarity but failing to recognize one's butcher when seen out of context on a bus.

Neuroscience Studies of Context Effects

Whereas the effects of context on memory have been examined primarily using behavioral methods, efforts to understand the neural systems underlying the processing of context information have proven illuminating. Memory tasks requiring the encoding and/or retrieval of context information have commonly identified the parahippocampal cortex as a critical system; the parietal cortex and the prefrontal cortex have also been implicated.

Bar and Aminoff (2003) performed four functional MRI (fMRI) experiments examining the processing of contextual information. In one experiment, subjects were presented with images of objects that had either weak preexisting associations with a specific context (e.g., a camera or a rope) or a strong preexisting contextual association (e.g., a roulette wheel), on the assumption that objects with strong contextual associations would be more likely to activate stored information about the context. For example, a subject presented with a roulette wheel would be more likely to activate stored information about the obvious context (a casino) than would subjects presented with objects that are not strongly associated with any particular context. Objects with strong contextual associations produced greater activity in parahippocampal areas, which have previously been shown to encode environmental and spatial information (Epstein and Kanwisher, 1998).

Hayes et al. (2007) presented subjects with visual objects superimposed over either a white background or a visual scene. During a recognition test, objects were presented either in their original context or over a white background, and participants displayed decreased performance when context was changed between study and test. Greater activity in the right parahippocampal cortex was found when participants successfully recognized objects previously presented in a scene. Intriguingly, when context changed between study and test, successful recognition of objects was associated with greater parahippocampal activation during encoding, suggesting that context reinstatement may be used as a retrieval/decision-making strategy.

Hayes et al. (2010) extended their previous work by examining the neural correlates of the 'butcher on the bus' phenomenon. At study, faces were presented either alone or superimposed over a background scene. At test, faces were always presented alone. Although subjects were instructed to focus only on the faces at study, recognition of faces was better for participants in the face study condition than the face–scene study condition. Faces from the face–scene study condition induced greater parahippocampal activation upon successful retrieval at test than the faces from the face-only study condition. Activation of neural systems involved in the storage of environmental and spatial information when presented with an associated face suggests that participants do form associations between a target item and its context and is also consistent with the notion that participants attempt to recall an associated context as a retrieval strategy.

Ecker et al. (2007) suggested that context affects primarily recollective processes in recognition, based on EEG/ERP evidence. Further support for the recollective effects of context comes from Balderas et al. (2008), who found that long-term (~24 h) memory for objects in contexts was impaired by pharmacological inhibition of protein synthesis in the hippocampus, but not in the perirhinal cortex. A number of investigators have proposed that recollection is primarily mediated by the hippocampus, and familiarity is primarily mediated by perirhinal (and associated) cortex (O'Reilly and Norman, 2002; Norman, 2010).

Combining fMRI with a virtual reality paradigm, Burgess et al. (2001) placed the parahippocampus in a network including parietal and various prefrontal regions. Activation of the prefrontal cortex is consistent with other studies of episodic memory (e.g., Köhler et al., 1998).

Skinner et al. (2010) used faces and scrambled faces as the context for target words rather than contexts containing spatial information, such as pictures of landscapes. Skinner et al. found increased activation in the fusiform face area for words studied with faces, relative to words studied with scrambled faces. Interestingly, this difference in activation was found although there was no difference in the overall performance between the context conditions. Similar to studies discussed above, activation in the prefrontal cortex was identified. Skinner et al.'s results suggest that rather than the parahippocampus being a 'context' area in the brain, neural recruitment of the cortical regions is likely to rely on

the type of contextual information associated with the to-be-remembered information.

Summary

In almost 100 years of study, behavioral research has clearly established that EC can influence memory performance in both human and nonhuman animals in a variety of ways. With regard to human memory, global EC has been shown to have a reasonably consistent effect on free recall performance. In contrast, local manipulations of context have produced more reliable effects for recognition memory. These effects are seen as context-dependent recognition or as context-dependent discrimination depending on whether specific item–context associations are encoded, and have been accounted for in both global matching and dual process theories of recognition memory. Neuroscience investigations of EC effects are delineating the neural systems responsible for these effects.

Abstract

This article examines the ways in which context is taken into account in contemporary social science research. The ecological perspective provides a conceptual framework within which to investigate complex interactions between persons and environments. Proximal settings are seen as connected to each other, contained within broader institutional and community contexts that shape their structure and influence what takes place within them. The scientific study of context presents a number of formidable methodological challenges. Among the most important of these challenges discussed in this article are deciding upon the most appropriate way to assess context, developing models of the transactional nature of contextual influence, and disentangling the effects of hierarchically organized environments. The study of context in the social sciences, once the province of disciplines such as sociology and anthropology, has now become an accepted focus of inquiry within perspectives that formerly had been concerned exclusively with the study of individuals in controlled, laboratory settings, such as psychology. This article examines the ways in which context is taken into account in contemporary social science research.

Historical Underpinnings

The contemporary study of context has its origins in a number of different disciplines, not only sociology and anthropology, but also *ethology* (the study of animal behavior in natural habitats), *ecology* (the study of biological organisms and their environment), and urban geography (the study of the development and functioning of neighborhoods in cities). All of these disciplines emphasize the fact that any human or animal behavior cannot be understood outside of the setting in which it occurs. In this sense, the organism and context are seen as inextricably linked.

Psychology, as a discipline, was slow to embrace a contextual point of view. Although numerous writers had attempted to move the field in this direction – most notably, Kurt Lewin (1951) – the study of psychology was dominated for much of the twentieth century by experimental scientists, who studied human behavior in the laboratory. Context was seen as a nuisance variable – something that got in the way of pure science – and the goal of experimental research was to study behavior under conditions that permitted the investigator to control any variable that was seen as extraneous to the research focus. If one wanted to study, for example, how individuals make decisions, the researcher would need to control the setting in which the decision making took place, so that each subject in the study could be observed under identical circumstances. The simplest way to do this was to perform research in a laboratory, where each and every element of the context could be controlled.

The benefit of controlled laboratory research is that it permits the scientist to isolate pure behavioral phenomena, uncontaminated by the outside environment. But this benefit must be weighed against the fact that phenomena observed under controlled experimental conditions may not be the same as phenomena observed in their natural context. The way in which individuals make decisions in a psychology laboratory, for instance, may not resemble the way they make decisions at home, at work, or in a store. Just as ethologists would not want to generalize observations of caged animals to the behavior of that same species in the wild, social scientists must be careful about generalizing findings derived from controlled experiments to human behavior outside the laboratory. This is not to question the importance of laboratory-based research but, rather, to note that the laboratory is itself a context, and that features of this context, like any other context, necessarily influence the behavior that occurs within it.

During the 1970s, concerns about ecological validity – the extent to which an observed phenomenon in a research investigation is a valid reflection of that phenomenon as it occurs in natural contexts – were voiced by numerous investigators working in a variety of areas. In the study of intelligence, for example, scholars raised questions about whether standardized intelligence tests adequately captured intelligent behavior as it occurs in the real world. Several researchers found that individuals who performed poorly on standardized tests of mathematics frequently demonstrated the ability to use very sophisticated mathematical reasoning when observed during day-to-day situations, such as shopping. Similarly, scholars of social behavior discovered that individuals' behavior was considerably influenced by the context in which it took place, and that conclusions drawn from studies of behavior in one context (e.g., observations of young children at home) could not always be extended to other settings (e.g., observations of these same youngsters in the preschool classroom). Ecological psychologists drew attention to the fact that individual behavior was profoundly shaped by the structure of the physical environment in which people lived. Several classic studies of schools indicated, for example, that students' behavior in small schools was markedly different from students' behavior in large schools (Barker and Gump, 1964).

In the late 1970s, psychologist Urie Bronfenbrenner drew widespread attention to the role of context in human development and behavior by noting that the scientific literature on child development was based almost entirely on the study of

children interacting with strangers in strange situations for the briefest amounts of time. How, Bronfenbrenner wondered, could social scientists hope to contribute to the solution of social problems, if they insisted on studying human behavior in a contextual vacuum? Although his comments were aimed at students of child development, they applied equally well to other disciplines. In his book, *The Ecology of Human Development*, Bronfenbrenner (1979) called on the field to think in more sophisticated fashion about the settings in which development took place, and he outlined a model of context that researchers could use to guide their thinking and empirical investigation. This work, and the thinking it would subsequently inspire, led to the development of the ecological perspective on human development, a perspective that grew more and more influential over the next several decades (Bronfenbrenner and Crouter, 1983).

The Ecological Perspective

Within the ecological perspective, the context is construed as a series of nested environments, with each level of contextual influence embedded within a larger level, not unlike a set of Russian dolls. At the innermost, or most proximal level of contextual influence, are the immediate settings in which individuals spend time – the family, the friendship group, the classroom, the workplace, the laboratory, and so forth. Most studies of the role of context in shaping human behavior and development are studies of single contexts examined in isolation from one another (e.g., the impact of the family context on child development, the impact of teaching practices on student achievement).

The ecological perspective provides a conceptual framework within which to investigate more complex interactions between persons and environments, however. Three notions are especially important in this regard. First, proximal settings are seen as connected to each other, because events that take place in one setting often have ramifications for individual behavior and development in another. Socialization in the family context influences how adolescents behave in the peer group, peer influence processes affect how adolescents behave in the classroom, experiences in the classroom affect students' performance in extracurricular settings, and so on. Within the ecological perspective, therefore, an important focus of inquiry is on the ways in which, and the extent to which, different settings are linked, and the impact of these links on individual behavior.

Second, within the ecological perspective, these proximal settings are seen as contained within broader institutional and community contexts that shape the structure of settings and influence what takes place within them (Duncan and Raudenbush, 1998; Jencks and Mayer, 1990). Families and friendship networks reside within neighborhoods, for example, and qualities of neighborhoods influence how families and friendship networks function. Parents interact with their children differently in poor neighborhoods than they do in more affluent ones, for example, and, as a consequence, child development may vary across neighborhood contexts. Similarly, schools exist within communities, and characteristics of communities – urban versus rural, tightly knit versus impersonal – necessarily influence the ways in which schools are organized and operate. Within the ecological perspective, therefore, one needs to examine relations among nested contexts as well as between individuals and settings.

Finally, proximal settings and the broader environments that contain them are located within particular historical, social, economic, political, geographical, and cultural contexts – 'macrosystems' – that influence the nature, structure, function, organization, and influence of all levels of the environment. Schools in Japan function differently than those in Canada, and differences between Japanese and Canadian schools have implications for the ways that teachers and students interact with each other, which in turn have implications for understanding student achievement in each context. A city's neighborhoods today may bear little resemblance to these very same neighborhoods 50 years ago, and the ways in which neighborhoods have changed over historical time may have important implications for understanding transformations in family life and parent–child relationships. Important social and economic events – wars, economic depressions, natural disasters – shape proximal and distal settings in important ways that have ramifications for individuals' behavior and development. Within the ecological perspective, researchers are interested in the influence of macrosystems on the settings located within them, and, consequently, in the rippling effects of these influences on individual behavior and development.

Methodological Challenges in Contextual Research

As more and more social scientists began to incorporate an increasingly sophisticated model of context into their research designs, it became clear that the scientific study of context presented a number of new and formidable methodological challenges. The discussion shifted from *whether* one needed to study context (the consensus was that one did) to how best to do so. Among the most important of these concerns involved deciding upon the most appropriate way to assess context, developing models of the transactional nature of contextual influence, and disentangling the effects of hierarchically organized, or nested, environments.

Objective versus Subject Assessment of Context

One of the longstanding debates in the study of context concerned the relative merits of objective versus subjective assessments of the environment. Objective assessments attempt to separate the measurement of context from the assessment of the individuals whose behavior is the target of investigation. A researcher interested in the influence of the parent–child relationship on child development might conduct impartial observations of family interaction in the home and draw his or her own conclusions about the relationship on the basis of what was observed. Similarly, a student of neighborhood stress and its impact on mental health might draw upon official statistics on crime, poverty, unemployment, and housing density and look at these in relation to residents' mental health problems.

Subjective assessments of context, in contrast, rely on the research participants' perceptions of their environment. These

perceptions can be assessed by asking individuals to complete questionnaires or by interviewing them about the settings in which they live. Thus, a researcher interested in parent–child relationships might interview parents about their socialization practices or ask children to complete questionnaires about their parents' behavior. Similarly, someone interested in neighborhood stress and mental health might collect information from neighborhood residents on their perceptions of the community's dangerousness, economic health, or housing quality and examine the links between these perceptions and one or more indices of mental health.

These different approaches to the assessment of context have particular strengths and weaknesses. The advantage of using objective assessments inheres in the fact that the assessment of context is not contaminated by the characteristics of the individuals whose behavior is being studied. Suppose, for instance, a researcher interested in neighborhood stress and mental health gathered information about each by interviewing a sample of residents, and found that depression was more prevalent in dangerous areas. Because depressed individuals may describe their neighborhoods in more negative terms than nondepressed individuals, however, it would be difficult to know whether the observed link between dangerousness and depression was genuine or merely an artifact of biased reporting. If, however, the relationship between dangerousness and depression were confirmed in a study using official crime statistics, one would have more confidence in the validity of the finding.

The advantage of using subjective assessments of context is that such assessments capture the context as it is experienced by the participant. Some social scientists argue that it is the subjectively experienced context, and not the objective context, that has the most profound impact on behavior and development. Individuals' perceptions of their neighborhood as safe versus dangerous, for example, may well influence how they behave far more than the actual level of crime as measured by official statistics. As the sociologist W.I. Thomas wrote early in the twentieth century, if individuals "perceive situations as real, they are real in their consequences" (Thomas and Thomas, 1928). Of course, one problem that arises when researchers rely on subjective assessments of context concerns the reconciliation of different subjects' perceptions of the same context. In family research, for example, it is common to find that different family members characterize their family context in different ways.

Ultimately, the most thorough assessment of context is one that employs multiple sources of information and uses multiple methods of assessment. By combining information from objective and subjective sources, from multiple vantage points, and gained through observational, self-report, and archival data, researchers are often able to provide richer and more accurate characterizations of a setting than are achieved through one approach alone.

The Transactional Nature of Contextual Influence

A second methodological challenge involves capturing the transactional nature of contextual influence. Although researchers often claim to be studying the influence of context on the individual, in reality the situation is far more complicated than this, in at least three important ways. First, individuals are not the passive recipients of contextual influence, but are active agents who shape the contexts in which they live. At the same time, contexts are not static entities, but settings that change and develop over time. Thus, while children are no doubt influenced by their family environment, family environments are themselves influenced by the children who inhabit them. Similarly, friendship groups both affect, and are affected by, their members. Finding ways to model the reciprocal and dynamic relations between individuals and their environments has been an especially difficult challenge for researchers.

Second, it is often difficult to separate the effects of contextual selection from those of contextual influence (Jencks and Mayer, 1990). In laboratory experiments, individuals can be randomly assigned by the researcher to different groups and then compared to see whether group membership affects individual behavior. Outside the laboratory, however, people often pick the contexts in which they spend time. Consider, for example, the often reported finding that delinquent teenagers often are members of peer groups composed of other delinquent adolescents. Is this because delinquent peers influence their friends to engage in antisocial behavior, or is it due, instead, to the propensity of delinquent individuals to choose to affiliate with others who share similar attitudes and values? Obviously, it is not possible to answer this question without randomly assigning individuals to different peer groups (not a feasible option in most research) or observing individuals and contexts over time. Similar problems exist in attempts to document the influence of neighborhoods on their residents. Because individuals have some control over where they live, it is difficult to disentangle the effects that neighborhoods have on individuals from the factors that lead some people to select particular neighborhoods in which to settle.

Third, different individuals are often affected by the same contextual factors in very different ways, making it extremely difficult to generalize about the effects of various contextual factors on individual behavior and development. A highly active and impulsive child may fare poorly in a relatively unstructured classroom, whereas this same context may be perfectly suitable for a more passive, more placid youngster. Similarly, an employee who is self-reliant and self-directed may thrive in a work environment that permits a great deal of autonomy, but this same work environment may prove problematic for an employee who needs a great deal of guidance and supervision. The recognition that contextual influence varies as a function of differences between individuals has stimulated a good deal of interest in the study of 'person–environment fit' – the extent to which a given context meshes well with the individual's personal characteristics.

Hierarchical Nature of Contextual Influence

The third methodological challenge concerns the hierarchical and interactive nature of contextual influence. The recognition that individuals are affected by multiple contexts simultaneously has necessitated the development of more sophisticated conceptual and statistical models in order to best describe the complicated ways through which individuals are influenced by the contexts in which they live (Duncan and Raudenbush, 1998).

Some contexts, for example, affect individuals directly, as when the behavior of a parent directly affects the development of a child. Other contextual effects occur through their impact on some other setting, however; stress in the parent's workplace may affect the child indirectly, through its impact on the family. In this instance, the second setting (in this case, the family) is said to 'mediate' the impact of the first setting (i.e., the workplace). And still other contextual effects occur by transforming, or 'moderating,' the impact of other contexts. Neighborhoods, for example, often exert their strongest impact on individuals not directly, but by attenuating or enhancing the impact of other contexts, such as the family or school. Within the context of an affluent and safe neighborhood, close parental monitoring may have deleterious effects on the child (because such monitoring may be experienced by the child as overprotective or intrusive), but the very same level of parental monitoring may have beneficial effects within the context of a dangerous, economically stressed community. In order to analyze direct, mediating, and moderating effects, researchers have had to develop new classes of multivariate statistical procedures, such as path analysis, structural equation modeling, and hierarchical linear modeling (Gelman and Hill, 2006).

Concluding Note

The growing appreciation of the importance of context in the study of human behavior and development stimulated a wave of new research in the 1980s and 1990s that sought to understand how individuals are affected by different levels of the environment, both independently and in interaction with each other. Multidisciplinary and interdisciplinary research that brought together social scientists from different disciplines became increasingly common, as scholars realized that understanding the complex interrelations among individuals and their environments necessitated drawing on the methods and theories of multiple disciplines. Over time, the study of individuals in natural settings has come to dominate research in fields in which controlled laboratory experiments had once been the dominant paradigm. Once considered a nuisance that interfered with the pursuit of 'pure knowledge,' the context of human behavior is now recognized as a necessary and enormously important focus of contemporary social science inquiry.

Continental Philosophy of Language

Cristina Lafont, Northwestern University, Evanston, IL, USA

Abstract

Continental philosophy of language is a tradition of reflexion on language initiated in the eighteenth century by authors such as J. G. Hamann and J. G. Herder, and later developed by W. von Humboldt. Through the work of M. Heidegger it has extended its influence to contemporary hermeneutic philosophy (H.-G. Gadamer, K.-O. Apel, J. Habermas). All the authors of this tradition are primarily interested in the world-disclosing function of language, that is, in the question of how language shapes our experience of the world through the net of concepts that it entails. Thus, they oppose the traditional view of language as a mere tool for the designation of entities given independently of language or the expression of prelinguistic thoughts. In contradistinction to this view, they consider language as constitutive of our experience of the world. But given the plurality of natural languages, this view seems immediately confronted by the problem of linguistic relativism: if speakers of different languages experience the world in genuinely different ways, how can they communicate with each other or reach shared knowledge of the world? Due to this difficulty, one of the main concerns in this tradition is to explain how understanding across different languages is possible.

Although philosophical interest in language is as old as philosophy itself, during the twentieth century this interest flourished to such an extent that the analysis of language has now become one of the most productive philosophical fields. Besides the general interest in language present in virtually all different philosophical traditions of the past century, it is possible to distinguish at least two very different ways of approaching linguistic analysis, namely the so-called Anglo-American and continental philosophies of language. The first (also called analytic philosophy) usually refers to the kind of analysis of language initiated at the end of the nineteenth and the beginning of the twentieth century by authors such as G. Frege, B. Russell, L. Wittgenstein, the logical positivists, etc. The second, continental philosophy of language, refers to the conception of language that finds its roots in the eighteenth century, in the works of authors such as J. G. Hamann and J. G. Herder, and was further developed in the nineteenth century by W. von Humboldt. Through the work of M. Heidegger it has extended its influence to contemporary hermeneutic philosophy (H.-G. Gadamer, K.-O. Apel, J. Habermas, etc.). In this article the specific features of the continental conception of language are examined.

In general terms, one of the crucial differences between the Anglo-American and the continental philosophies of language is the explicit attempt found in all the authors of the continental tradition to break with what Humboldt termed the "primacy of logic over grammar," that is, the predominance given from the very beginnings of Greek philosophy to the cognitive function of language at the expense of its communicative function. As a consequence of conceiving language less as a vehicle of knowledge and more as a means of understanding, this tradition analyzes the role that language plays not only in our relationship with the objective world (by allowing us to have propositional knowledge about it) but also in our relationship with the social world (which is constituted through communicative interaction) and with our own subjective worlds (which are expressible through linguistic articulation). In this way, language is considered in its multidimensional world-disclosing function. In keeping with this focus, the continental philosophy of language has always concentrated on the analysis of natural languages, developed through contingent historical processes, and has considered these as constitutive of our experience of the world.

To understand the roots of the distinctive features of the continental conception of language, it is important to keep in mind that this conception was developed against the background of an explicit confrontation with Kant's philosophy. This is important because, despite all the criticisms of Kant, the continental philosophy of language remains to this day under the decisive influence of transcendental philosophy. This influence explains two of its most characteristic features: its idealist tendencies (which in some cases lead to a clear hypostatization of language, most remarkably in the work of the late Heidegger) and one of the crucial problems that have concerned the authors of this tradition from the very beginning, namely the problem of linguistic relativism. The connection between these features can be understood best through an analysis of the different historical phases of development within this tradition.

The Hamann–Herder–Humboldt Tradition

As already suggested, most of the reflexions on language found in the works of the authors of this tradition take place in a more or less explicit confrontation with Kant's philosophy. In the cases of Hamann and Herder, this confrontation takes the specific form of a metacritique of Kant's critique of pure reason (see Hamann (1784) and Herder (1799)). One important target of both metacritiques is Kant's attempt to purify reason from its internal connection with language. The constant reference that Hamann and Herder make to the common origin of both expressions language and reason in the Greek word *logos* is by no means a merely etymological remark. With the explicit identification of language and reason (i.e., the claim that "reason is language, *logos*" or "without the word, neither reason nor world"), these authors initiate a way of thinking about both language and reason that moves constantly

 http://dx.doi.org/10.1016/B978-0-08-097086-8.63012-X

between the extremes of universalism and relativism, rationalism, and irrationalism. On the one hand, the identification of language and reason supports the attempt to transform Kant's idea of a critique of reason into the romantic idea of the essential limitations of reason (due to the limits of the natural languages that contingently developed in history). This is a powerful motive behind the critique of the Enlightenment in which many authors of this tradition participate (from Hamann to Heidegger and Gadamer). On the other hand, however, the identification of language and reason also supports the attempt to preserve the universalism of Kant's conception of reason in an equally universalist conception of communicative rationality (from Humboldt to Apel and Habermas). But beyond the remarkable differences in the philosophical programs among the authors of this tradition, the common presupposition behind their identification of language and reason is the view of language as constitutive of our experience in the strict sense given by transcendental philosophy. Accordingly, language is conceived as having the transcendental power to constitute experience that Kant erroneously ascribed to an abstract, transcendental ego.

Hamann's critique of Kant can be seen in retrospect as the initiator of such a view. Hamann identifies language as the common root of sensibility and understanding, which was sought by Kant without success. In this way, he considers language as both empirical and transcendental at the same time. By conceding to language such a quasitranscendental status, Hamann certainly disagrees with Kant's view of language. However, he does not disagree with the most basic assumptions of transcendental philosophy. Hamann is actually taking for granted Kant's transcendental idealism, namely the idea that the conditions of possibility of experience are at the same time the conditions of possibility of the objects of experience. As a consequence of Hamann's critique, this idea is now understood to mean that the conditions of possibility of our linguistically mediated experience of the world are, at the same time, the conditions of possibility of that which is experienced in the world. Now, the claim that language does not merely mirror but actually shapes our experience of the world faces a problem completely foreign to transcendental philosophy. For the various historical languages do not seem to offer an equivalent for the Kantian transcendental ego. First of all, these languages are plural. And second, they do not allow for a sharp distinction between the empirical and the transcendental, between that which is supposed to count as valid in them a priori (knowledge of the language) and that which is valid a posteriori (knowledge of the world). Thus, if languages shape our experience of the world, they do so in merely contingent and plural ways. As Hamann points out, the meaning and use of words of different languages are "a priori arbitrary and indifferent, but a posteriori necessary and indispensable." Seen in this light, Hamann's critique of Kant seems to force the relativist conclusion that Humboldt will express later in one of his most famous theses, namely, that "every language contains a peculiar world-view."

Hamann never addressed the problem of linguistic relativism entailed in his transformation of transcendental philosophy. Moreover, given the decisively antisystematic impulse behind his critique of Kant's philosophical system, he never attempted to work this new view of language into a systematic conception. His reflections on language are limited to more or less isolated remarks spread throughout his writings. A much more elaborate account of this new conception of language can be found in Humboldt's work. Although Humboldt's general reflections about language do not amount to a philosophical theory of language – they are mostly confined to the introductions to empirical works in comparative linguistics – one of their specific aims is to bring about a radical break with the traditional conception of language. Humboldt is convinced that without such a break a science of language is not possible at all. Thus, his writings contain a very articulated account of the essential features that distinguish the new conception of language from the received view.

In the context of criticizing the traditional conception of language in his work *Ueber den Nationalcharakter der Sprachen*, Humboldt enumerates the basic features of his own conception of language when he remarks "that the diversity of languages is more than a mere diversity of signs, that words and their syntax simultaneously shape and determine our concepts and that, given their systematicity and their influence on knowledge and sensibility, different languages are in fact different world-views" (Humboldt, 1903–1936, IV, p. 420). In this brief summary, we can see the three fundamental claims that separate Humboldt's position from the received view: (1) the rejection of the view of language as a mere system of signs, as a tool for the transmission of prelinguistic thoughts or the designation of objects that exist independently of language; (2) the thesis of the identity of thought and language that justifies the critique of the instrumental conception of language; and as a consequence, (3) the claim that different languages are in fact different world-views. The problem of linguistic relativism implicit in this consequence can be traced back to the very core of Humboldt's critique of the instrumental conception of language.

The traditional view of language as a mere instrument for the designation of entities independent of language is based on an assimilation of two relations that are actually irreducible to one another: the relation of designation between a name and an object and the relation of satisfaction between a predicate and the objects to which the predicate applies. From this assimilation there arises the problem of determining what the predicates actually designate, a problem encountered already in the Middle Ages; the ensuing dispute over the universals offers clear testimony as to its depth. Nonetheless, this highly problematic conception of language can be considered as the ruling view from Aristotle to Kant. Humboldt seeks a decisive break with this reduction of the powers of language to their designating function, advocating a more stratified analysis of language. In contemporary terms, such an analysis would have to deal not only with the name/object distinction but also with the distinction between concept (or class) and object. By the same token, concerning the interpretation of signs, this analysis would have to differentiate between their meaning and reference. Humboldt states this last distinction as follows: "The word acts in such a way that the object given in it is represented by the soul. This representation must be distinguished from the object; … along with the objective part *that relates to the object*, it has a subjective part that *lies in its manner of conceiving*. … In turn, we scarcely need to mention that this division rests upon [an] abstraction; [further,] that the word can have no place

outside of thought, and neither can its object, if it is non-physical … This remains so even in the case of material objects, *since it is never the objects directly, but always only the representation of them provided by the word, that is made present in the soul*" (Humboldt, 1903–1936, V, p. 418).

It is important to note that by introducing the useful distinction between the referent of the word and its meaning, Humboldt also excludes every possibility of a pure designating-relation between a name and its object, which was the paradigm for the traditional explanation of the functioning of language. He generalizes the meaning/reference distinction as applicable to all linguistic signs. Accordingly, Humboldt extends this distinction even into the realm of names, including proper names. He continues: "The word conceives of *every concept as general*, always designating, strictly speaking, classes of reality, *even if it is a proper name*; for thus it comprehends … all the various states, with respect to time and space, of that which it designates" (Humboldt, 1903–1936, V, p. 419).

Thus, Humboldt counteracts the problematic reduction of predicates to mere names in the traditional view with the inverse reduction, namely the assimilation of names to predicates. This move can be considered the systematic point from which the problem of linguistic relativism arises. If this is not immediately evident, it soon becomes clear by analyzing its implications. According to this assumption, names are actually general concepts. Instead of designating an object, they too, by strict analogy with predicates, can relate only in a mediated fashion to their referent, as if to an object falling under a concept. Humboldt explains: "the picture of language as merely designating *objects*, already perceived in themselves, is also not sustained by examination of what language engenders as its product … Just as no concept is possible *without language*, so also *there can be no object for the mind*, since it is only through the concept, of course, that anything external acquires full being for consciousness. But the whole *mode of perceiving* things *subjectively* necessarily passes over into cultivation and the use of language. For the word arises from this very perceiving; it is a copy, not of the object in itself, but of the image thereof produced in consciousness" (Humboldt, 1903–1936, VII, p. 60). Seen in this light, the idealistic conclusion that Humboldt draws from this assumption seems entirely consistent: namely that "man [lives] with the objects … *exclusively* in the way that they are conveyed to him by language" (ibid.). This in turn explains why different languages are in fact different world-views. As Humboldt remarks in a similar context: "In this way, in words of identical meaning that are found in a number of languages, there arise diverse representations of the same object, and this characteristic of the word contributes chiefly to the fact that *every language yields a peculiar world-view*" (Humboldt, 1903–1936, V, p. 420).

However, once the diversity of conceptual systems or world-views contained in the different languages is recognized, it is no longer clear how speakers of different linguistic communities can talk about the same things and thus communicate successfully. Humboldt has to admit that "every language places *definite boundaries* upon the spirits of those who speak it, and insofar as it provides a determinate orientation, excludes others" (Humboldt, 1903–1936, VII, p. 621). The commensurability of different linguistic world-views does not become a problem for Humboldt because he has any skeptical doubts about the possibility of translation between languages. Actually, Humboldt remarks repeatedly that "experience with translation of the most diverse languages … shows that *it is possible to express every concatenation of ideas in every language*" (Humboldt, 1903–1936, IV, p. 17). Instead, the problem of linguistic relativism originates in the fact that through his criticism of the traditional conception of language Humboldt has destroyed the plausibility of the traditional answer to this problem. His conception of language as world-disclosing precludes the possibility of explaining interlinguistic understanding by appealing to a world in itself accessible to all human beings in the same way and to which all speakers refer through the different conventions of their languages.

Humboldt is aware of this challenge and indeed tries to articulate an alternative answer to the question of interlinguistic understanding. His answer is also based on a criticism of the traditional view of language, but this time from a different angle. Humboldt opposes the reduction of language to a mere system of signs entailed in the traditional view. In the introduction to his work on the Kawi language, Humboldt expresses this opposition with the help of one of his most famous claims, namely, that language is not a product (*ergon*) but an activity (*energeia*). To take this claim seriously implies transforming the traditional conception in two important respects.

First, in the sense already mentioned, Humboldt's view of language as an activity underscores the fact that language does not passively mirror the world but it is actually world-disclosing. Language is what makes the world appear as an ordered whole. For it is through the web of linguistic concepts that what would otherwise be a disconnected flux of perceptions is transformed into an order of objects properly so called. In this sense, Humboldt claims that "the generation of language is, from the beginning, a *synthetic process* in the most genuine sense of the term, *where the synthesis creates something that did not exist before in any constituent part*" (Humboldt, 1903–1936, VII, p. 95). Humboldt terms this genuine synthesis "articulation" and regards it as "the authentic essence of language, the lever *through which language and thought are produced*, the culmination of their intimate mutual connection" (Humboldt, 1903–1936, VI, p. 153).

However, there is a second, more radical sense in which Humboldt sees language as an activity. According to Humboldt, the synthetic process through which both language and thought are produced is not something given once and for all, that is, fixed through the grammar and lexicon of a language. It is rather the result of praxis, namely the process of communication between speakers. As he remarks repeatedly: "Language only exists in ongoing speech; grammar and lexicon are hardly comparable to their dead skeleton" (Humboldt, 1903–1936, VI, p. 148). Humboldt opposes the reduction of language to a mere vehicle of thought that underlies the analysis of language in logic. In this context, language is considered in abstraction from the use of language in speech for the purposes of analyzing the general structure of thoughts. But Humboldt's opposition to this abstraction is not based on the obvious fact that language, in addition to being a vehicle of thought, is also a means of communication. His view is rather that language can only be a vehicle of (intersubjective) thought to the extent that it makes communication and understanding between speakers possible. Thus, a proper analysis of the cognitive

function of language is impossible if language is considered in isolation from its communicative function. Behind Humboldt's claim is the idea that the different communicative perspectives, generated through the system of personal pronouns present in all languages, are the condition of possibility of any intersubjectively valid thought. For these different perspectives make it possible that speakers both express their views in their irreducible singularity and achieve a common understanding through conversation as well. Thus, the commensurability of linguistic world-views is not guaranteed in advance by a unique syntax or lexicon; it is actually the result of a different feature of all languages, namely its dialogical structure. It is in virtue of the pragmatic structure of speech that a free synthesis of perspectives among speakers can come about in conversation.

Humboldt is fascinated by the double nature of language as the *source* of both *generality* and *individuality*. Due to its general character, language makes it possible that different speakers share identical concepts (and in this way fulfills a socializing function). But due to its expressive potential, it also allows speakers to maintain their genuine individuality (i.e., it makes individualization possible). Humboldt explains that "in language the *individualization* within a *general conformity* is so wonderful, that we may say with equal correctness that the whole of mankind has but one language, and that every man has one of his own" (Humboldt, 1903–1936, VII, p. 51). However, there is an obvious tension in this view. On the one hand, Humboldt claims that in virtue of its intrinsic generality (the fact that we can share it), language entails the condition of possibility of understanding among speakers. It guarantees, in Humboldt's words, that "nobody may speak differently to another from the way in which the latter, under similar circumstances, would have spoken to him" (Humboldt, 1903–1936, VII, p. 47). But on the other hand, the possibility of understanding among speakers is not a mere function of a shared grammar or lexicon. Given that the only reality of language is speech, genuine understanding can only be the lucky outcome of the process of communication itself, in which different individuals express their individuality or particular world-view. For "only in the individual does language get its last determination … A nation as a whole has indeed the same language, but not all the individuals in it have … exactly the same one, and if one looks more carefully, every person actually has his own" (Humboldt, 1903–1936, VI, p. 183). But given that speakers' linguistic differences are actually differences in world-view, it is not clear within Humboldt's account how speakers can talk about the same things despite their genuinely different linguistic world-views. Without such an explanation the possibility of understanding in dialogue remains puzzling. Humboldt has to recognize that "nobody means by a word precisely the same as his neighbor does, and the difference, be it ever so small, vibrates, like a ripple in water, throughout the entire language. Thus, all understanding is always at the same time a not-understanding, all agreement in thought and feeling at the same time a divergence" (Humboldt, 1903–1936, VI, p. 183). The tension present in Humboldt's writings between the roles ascribed to language in its world-disclosing and in its communicative dimensions remains a characteristic feature of the works of most of the authors of this tradition.

Further Developments in the Twentieth Century

M. Heidegger is undoubtedly the most influential defender of Humboldt's conception of language as world-disclosing in twentieth-century philosophy. However, despite the deep similarities between the conceptions of language developed by both authors, Heidegger was rather critical of Humboldt's approach to language at different times during his philosophical development and for different reasons (see Heidegger, 1927 and 1986). The view of language as responsible for world-disclosure is not articulated explicitly in Heidegger's early writings, although some features of what would be his later conception of language already appear in them, including in *Being and Time* (see Lafont, 2000). Most of Heidegger's reflections on language are contained in a collection of articles that appeared in English under the title *On the Way to Language*.

As is characteristic of all the authors in this tradition, Heidegger articulates his view of language as world-disclosing in direct opposition to the traditional conception of language as a mere tool for the designation of objects that exist independently of language. He argues that the linguistic activity of naming something with a word cannot be understood as a pure relation of designation between a name and an entity. It does not consist in the fact "that something already familiar to us is provided with a name, rather … through this naming, the entity is first nominated as that which it is. It is in this way that it is known as an entity" (Heidegger, 1944). In *The Origin of the Work of Art* Heidegger explains: "When language names the entity for the first time, such naming alone brings the entities to word and to appearance. This naming nominates the entity to its being from out of this being. Such saying is a projecting of the clearing, in which it is announced as what the entity comes into the open" (pp. 59–60). In *On the Way to Language* he expresses the same idea in a much more provocative way using a line of Stefan George's poem, namely, that "there is no thing where the word is lacking." Heidegger explains: "The thing is a thing only where the word is found for the thing. Only in this way *is* it … The word alone supplies being to the thing, [for] … something only *is*, where the appropriate word names something as existing and in this way *institutes* the particular entity *as such* … The being of that which is resides in the word. For this reason, the following phrase holds good: language is the house of being" (pp. 164–166).

As Humboldt had already argued entities can only be identified as such once they are linguistically categorized. It is in this sense that language is responsible for world-disclosure: language determines our possible experience with entities and thus determines in advance what kind of world is disclosed to us. With regard to the world-disclosing power of language, Heidegger basically agrees with Humboldt. However, on this very same basis he criticizes Humboldt's view of language as an activity. As mentioned previously, Humboldt tried to conceive the production of a linguistic world-view as a result of the human activity of speech. This would explain how speakers can synthesize their different world-views and revise them through dialogue. However, as Heidegger argues, in order for a dialogue to be possible at all, it is first necessary that one and the same world be disclosed to all speakers. As he had already claimed in *Being and Time*, "only he who already understands can listen." Heidegger interprets Humboldt's

emphasis on the communicative dimension of language as just a reminiscence of the instrumental conception of language. Heidegger directs one of his most provocative claims against any attempt to transfer language's power of world-disclosure to the human activity of speech. He writes: "Man acts as though he were the shaper and master of language, while in fact language remains the mistress of man … For strictly, it is language that speaks. Man first speaks when, and only when, he responds to language by listening to its appeal" (Heidegger, 1954, p. 184).

As a result of this extremely idealistic conception of language, Heidegger sees the world-disclosure, which is anchored in the language of a specific people or culture, as the most significant event of their historical development (see Heidegger, 1980). Based on this idea Heidegger interprets the history of Western culture as the fateful development of the understanding of being as presence, which is disclosed in Western languages and may bring this culture toward its own destruction. From a Humboldtian point of view, the reification of language implicit in Heidegger's view seems just a consequence of ignoring that language is not a product but an activity, that is, that language is nothing other than the communicative activity between human beings. However, it is hard to question Heidegger's criticism of this Humboldtian claim, given that for both authors language has the power to constitute our experience in the strict sense set by transcendental philosophy. So long as this presupposition is not questioned, achieving the balance sought by Humboldt between the world-disclosing and the communicative dimensions of language remains an unresolved task in this tradition.

H.-G. Gadamer, Heidegger's most influential student in contemporary German philosophy, tries to achieve this balance in his main work *Truth and Method*. In this work, Gadamer articulates the essential features of the approach to philosophy that he calls "philosophical hermeneutics." At the core of this approach is an analysis of hermeneutic experience, that is, of the interpretative relationship that human beings entertain with each other and with their symbolic products (e.g., texts, works of art, and the like). To support his account of hermeneutic experience, he appeals to the conception of language developed in the Hamann–Herder–Humboldt tradition, to which he wishes to contribute with his own reflections on language. He uses the Humboldtian model of dialogue between speakers who try to reach agreement about something in the world and generalizes it as the appropriate model for describing any hermeneutic experience whatsoever (e.g., the understanding of canonical texts, works of art, and any other symbolic products by an interpreter, most significantly in the context of the human sciences). In this respect, Gadamer explicitly focuses on the communicative dimension of language. However, he looks at the Humboldtian model of dialogue with Heideggerian eyes.

Gadamer emphasizes that a genuine dialogue by its very nature is not just the product of the speakers' activity. First of all, as Gadamer remarks, "no one knows in advance what will come out of a conversation. Understanding or its failure is like an event that happens to us" (Gadamer, 1960, p. 383). But more important, a conversation is only possible if the participants share a linguistically disclosed world. Thus, a shared world-disclosure, that is, a common tradition, is the precondition for any understanding or agreement that speakers try to bring about in conversation. Although Gadamer opposes, as much as did Humboldt, the thesis of the incommensurability of different linguistic world-disclosures, he has never seriously confronted the challenge of explaining how intercultural understanding is possible, that is, how a dialogue between participants who do not belong to the same tradition and thus do not share the same linguistic world-disclosure is possible at all.

More recently K.-O. Apel and J. Habermas have tried to work Humboldt's and Gadamer's model of dialogue into a systematic theory of communication (see Apel, 1994 and Habermas, 1981). Both authors identify in the communicative function of language a specific kind of rationality (communicative rationality) that allows participants in communication to reach a rational agreement about something in the world. Although they share the view of language as world-disclosing that characterizes the continental tradition, their approaches introduce a strong dichotomy between form and content that aims to conceive rational understanding as a universal possibility (and thus to avoid the problem of incommensurability between different linguistic world-disclosures). In clear opposition to Heidegger and Gadamer's claim that understanding is only possible on the basis of a factual agreement among speakers with a shared linguistic world-disclosure, Apel and Habermas claim that understanding depends only on a "counterfactual agreement" that all speakers share just in virtue of their communicative competence. This agreement is based on formal presuppositions and thus it does not depend on a shared content or shared world-disclosure among the participants in conversation. A rational reconstruction of these formal presuppositions of communication is the core of the analysis of language that these authors offer in their respective approaches. Apel understand this analysis as a transformation of transcendental philosophy within the linguistic paradigm and thus calls it "transcendental semiotics." Habermas disagrees with Apel's claim that the formal presuppositions of communication have a transcendental status in the strict Kantian sense; thus he prefers the designation of "formal pragmatics" for his approach. But beyond these methodological differences, their reconstructions of the formal presuppositions of communication are very similar.

According to both approaches, speakers who want to reach an agreement about something in the world have to presuppose the truth of what they are saying, the normative rightness of the interaction they are establishing with the hearer through their speech acts, and the sincerity or truthfulness of their speech acts. Complementary to these three validity claims (truth, normative rightness, and truthfulness), speakers share the notion of a single objective world that is identical for all possible observers. This is just a formal notion that is freed of all specific content. It is important to notice that this presupposition does not correspond to the naïve belief in a world in itself accessible to all speakers that characterizes the traditional conception of language. As Habermas argues, if speakers had such a naïve belief they would identify the *contents* of their respective linguistic world-views with the assumed world-order itself. But with such a dogmatic attitude they would not admit the possibility that in case of disagreement the claims raised by other speakers may turn out to be right about the way the world

is. In order for a rational discussion to be possible at all, speakers have to be able to adopt a hypothetical attitude vis-à-vis their own beliefs about the world. And this is only possible if they distinguish, however counterfactually, between the assumed world-order itself and their respective claims about how the world is. Seen in this light, the formal presupposition of a single objective world is just a consequence of the universal claim to validity built into the speakers' speech acts. It is just an expression of the communicative constraint that makes rational criticism and mutual learning possible, namely that from two opposed claims only one can be right. Thus, the formal notion of world and the three universal validity claims build a system of coordinates that guides the interpretative efforts of the participants in communication toward a common understanding, despite their differences in beliefs or world-views.

It is an open question whether this proposal is actually successful in explaining the possibility of interlinguistic understanding, as much as it is open whether any current theory within contemporary philosophy of language is so successful. However, Apel's and Habermas's approaches are intentionally designed to meet this challenge in a way unprecedented in the prior continental philosophy of language. Equally unprecedented is the scope and sophistication of the philosophical analysis of language and communication that these authors offer. This is in part due to the reception and creative integration in their own work of most of the approaches developed within contemporary philosophy of language across the borders of the different philosophical traditions.

Continuing Professional Development

Helen S Timperley, Faculty of Education, School of Learning, Development and Professional Practice, The University of Auckland, Epsom, Auckland, New Zealand

Abstract

Challenges in education are rising with expectations from policy makers about what teachers can do to meet them constantly increasing. Continuing professional development for teachers has been promoted as the multimillion-dollar solution, but unfortunately most approaches have little demonstrated its impact on teachers' ability to meet these demands. This article draws on the international literature that does provide evidence of effectiveness in terms of having a positive impact on student learners. The article outlines some of the shifts in thinking that underpin the effective enactment of a systematic inquiry and knowledge-building approach to continuing professional learning together with evidence of improvement in students' engagement and learning.

Introduction

The 'face' of education is changing across many parts of the world: new curricula are appearing with accompanying new approaches to assessment. New technologies are pervading teaching and learning spaces with student learners often outstripping the skill levels of their teachers. In many educational jurisdictions, the composition of the student body is changing along with expectations that all students will learn, not just those who respond readily to the teaching offered. Raising the bar and closing the gap has become a major concern in many countries (OECD, 2010) with continuing teacher professional learning as the multimillion-dollar solution.

The rationale underpinning this solution is that teaching matters, and therefore improving the quality of teaching through professional development will solve the problems. A consistent finding of meta-analyses investigating the effects of education on student outcomes indicate that teacher effects are much larger than school effects whatever the educational jurisdiction (e.g., Bransford et al., 2005; Muijs and Reynolds, 2001; Nye et al., 2004; Scheerens et al., 1989). The case for focusing on teachers and teaching is clearly articulated into a study by Wright et al. (1997):

> The results of this study will document that the most important factor affecting student learning is the teacher. In addition, the results show wide variation in effectiveness among teachers. The immediate and clear implication of this finding is that seemingly more can be done to improve education by improving the effectiveness of teachers than by any other single factor.
>
> p. 63

By 2005, the growing international agreement about the new evidence base informed the landmark OECD (2005a) report 'Teaching Matters.' In the accompanying influential OECD Indicators Report (2005b), the policy importance of both pedagogy and professional development were highlighted: "at the level of the education system, professional development of teachers is a key policy lever" (p. 20).

The hope generated by this research into the importance of teaching has rarely been matched by the impact of continuing professional development to improve it. After outlining the importance of teacher quality, Hanushek (2005), for example, rejected continuing teacher education as the key policy lever because "despite some success in general they [continuing professional development programs] have been disappointing" (p. 19), and "existing evidence on in-service programs gives insufficient means for selecting a program that is likely to yield significant gains in teaching performance" (p. 19).

This issue is illustrated by the contrast between the international enthusiasm for, versus the practice of, assessment for learning. Since the Assessment Reform Group in England coined the term 'Assessment for Learning' in 1998, it has become part of many educational systems around the world. A quick Google search yields over 11 million hits; countless books have been written about it; and it has become a stalwart of assessment policy statements and professional development in many educational jurisdictions. Despite this wide acceptance, there is research evidence that assessment for learning is either absent or superficial in most classrooms with little of the desired change evident in many learning environments. The Learning How to Learn Project in England (James et al., 2007), for example, found that the participating teachers' implementation often reflected what they called the 'letter' of assessment for learning, focusing on the surface techniques, rather than the 'spirit,' based on a deep understanding of the principles underlying the practices. Only about 20% of the teachers in the study were using assessment for learning in ways that were designed to help students develop as learners.

The impact of continuing professional development on reducing the gaps between those who traditionally succeed in our education systems and those who form the core of the rapidly rising school populations is particularly concerning. The recent report on equity by the OECD (2010) reinforces what has become a consistent finding over time that many schooling systems and the teaching that occurs within them serve to maintain rather than reduce these inequalities despite all the efforts to change them. Many students are not learning what they need to learn despite interventions to help their teachers to teach more effectively. On the other hand, there are many documented instances where teachers and schools are making this difference through their involvement in

 http://dx.doi.org/10.1016/B978-0-08-097086-8.92134-2

continuing professional development. What is needed, therefore, is to draw on the evidence of the approaches that have demonstrated effectiveness to rethink the typical approaches to professional development for teachers.

The Research Base

The primary evidence base for this article is a synthesis of the international literature on approaches to continuing professional development that have resulted in changes in practice and improved outcomes for student learners (Timperley et al., 2008). The synthesis began with the development of a theoretical framework to identify the possible attributes of continuing professional development likely to result in improved outcomes for student learners. The framework included attributes of the wider educational context (e.g., formal educational policies), the professional learning context (e.g., people and practicalities), the content of the professional learning opportunities (e.g., a focus on curriculum or pedagogies), the activities constructed to promote learning of the content (e.g., coaching), the professional learning processes promoted (e.g., creating dissonance with current understanding), the responses of diverse teacher learners (e.g., high/low levels of teacher engagement), and the impact on diverse learners including social, personal, and academic outcomes.

Each attribute was treated as neutral with regard to its impact on teaching practice or student learners until it was tested against the empirical evidence provided through the published literature which documented relationships between continuing professional learning, changes in teaching practice, and improved outcomes for learners. The application of standard methodological criteria identified 72 individuals and groups of related studies of independent interventions with a total of 227 effects (Cohen, 1988). The reported attributes of the professional development in these studies were then mapped onto the theoretical framework to identify the kinds of teacher knowledge and the circumstances under which it was acquired that were associated with benefits to students. Identification of the attributes in each category was then combined into a model that captured the main characteristics of continuing professional development that resulted in positive outcomes for student learners.

The model was further developed, assessed, and refined through its application in a professional learning project involving 300 schools. It was found to be highly effective in improving outcomes for learning, particularly those not well-served by our education systems. This project focused on improving literacy in separate cohorts of approximately 100 schools per cohort over 6 years. Repeated patterns of improvement beyond expected gains in reading and writing, particularly for the lowest achieving students, were evident in each cohort (Timperley et al., 2010). After taking into account the average expected gain, the average effect sizes for the final cohort as a whole was 0.44 for reading and 0.88 for writing on a nationally standardized test. This equates to a rate of progress 1.85 times greater than expected nationally for students in schools with a reading focus, and 3.2 times the expected improvement for those in schools with a writing focus. The rate of progress for those students beginning in the lowest 20% was even larger, with an effect size of 1.13 for reading and 2.07 for writing. These gains equate to progress of 3.2 times nationally expected gains for the lowest 20% of students for reading and 6.2 times expectation of students for writing. The effect sizes were calculated using Cohen's d (1988) with Hedge's correction.

The Model

Most empirical studies analyzed in the synthesis that reported significant differences to student outcomes began by involving teachers in cycles of inquiry that asked them to identify what students needed to know and do to meet curricula and other goals valued by the communities in which students live and are educated (see **Figure 1**). When profiles of students' achievement were well understood, teachers then inquired into the knowledge and skills they needed if they were to become more effective in addressing the learning needs of individuals and groups of students, particularly those not achieving as well as others. From there, teachers engaged in new professional learning that deepened their knowledge and refined their skills so they could engage students in new learning experiences in classrooms. Given that the effectiveness of all teaching practice is influenced by context and no particular practices can be guaranteed to result in particular outcomes, the final stage of the inquiry involved examining the impact of changed actions on the outcomes for students that were the focus of the inquiry. Through this process teachers came to understand what had been effective and what had not. Those studies demonstrating sustainability of improvement in teaching and outcomes for students used the findings from this examination of impact to inform ongoing cycles of inquiry (Fennema et al., 1993; Lai et al., 2009; McNaughton et al., 2004; O'Connell, 2009; Schmitt et al., 2005).

Each of these dimensions of the cycle will be described in greater detail in the following section, but before doing so, some assumptions underpinning the model and shifts in thinking usually required for continuing professional development to make the difference are outlined.

Shifts in Thinking to Make the Difference

The first assumption underpinning the model involves a shift in thinking from continuing professional development to continuing professional learning. Both are intentional, ongoing, and systematic processes (Guskey, 2000). Over time, however, the term 'professional development' has taken on connotations of delivery of some kind of information to teachers so as to influence their practice, whereas 'professional learning' implies an internal process in which individuals create professional knowledge through interaction with this information in a way that challenges previous assumptions and creates new meanings.

The second shift in thinking highlights the need for professional learning to be underpinned by an explicit and defensible theory of professionalism. Those who require or offer teachers discrete opportunities to participate in professional

Figure 1 Teacher inquiry and knowledge-building cycle to promote valued student outcomes.

development workshops, courses, or conferences, typically come from a vision of teaching as one of routine expertise. Learning for routine experts involves finding out how to apply a core set of skills and routines with fluency and efficiency. Notions of routine expertise are based on assumptions that novice teachers become experts through supported practice (Dall'Alba and Sandberg, 2006). This perspective is best summed up as 'practice makes perfect,' where skill development takes place in a stepwise, cumulative manner. Becoming a highly competent professional, therefore, involves progressively developing a set of knowledge and skills relevant to that profession (e.g., Dreyfus and Dreyfus, 1986) in which problems are identified intuitively and holistically with appropriate strategies enacted to solve them.

Professional learning that impacts positively on student engagement and learning, described in this article, is underpinned by an alternative vision of teachers being adaptive experts (Hammerness et al., 2005; Feiman-Nemser, 2008; Hatano and Inagaki, 1986). Timperley (2012) defined adaptive experts as those focused on the moral imperative of promoting the engagement, learning, and well-being of each student for whom they have responsibility. To achieve this outcome they are aware of the assumptions underpinning their practice, including their cultural positioning, and know when these assumptions are helpful for their learners and when to question them, and if necessary, to let them go. Fundamental to doing this is the active seeking of deep knowledge about both the content of what is taught and how to teach it effectively for their learners in particular contexts. In their practice they work with others, including their student learners, to:

- Retrieve, organize, and apply professional knowledge in light of the challenges and needs presented by the learners they are teaching, particularly those not engaged.
- Seek evidence about the impact of their teaching on learners' engagement, learning, and well-being.
- Seek to develop innovative approaches when regular routines are not working for their learners and know when they need to seek help.
- Engage in ongoing inquiry for building knowledge as core to their professionalism.

Rather than continuing professional development being seen as a series of events in which teachers participate, it is seen as an active process of systematic inquiry into the effectiveness of practice to improve student engagement, learning, and well-being. From this perspective, the 'continuing' part of professional learning means 'all the time' throughout a teacher's career.

The third shift in thinking involves seeing student learners at the center of the process. Improvements in outcomes for students are not a by-product of professional learning but rather its central purpose. Student learners must be the touchstone and the reason for teachers to engage, the basis for understanding what needs to be changed and whether those changes have been effective. Part of this shift involves creating mindsets that have at their core a belief that schooling is about ensuring deep learning for all.

The fourth shift in thinking involves foregrounding the knowledge and skills of focus rather than forms or delivery methods for continuing professional learning. Many studies analyzed in the best evidence synthesis on professional learning and development (Timperley et al., 2008) found that a great deal of emphasis was given to descriptions of the details of the activities in which teachers engaged rather than what they learned. No activity or process, whether facilitated by others (e.g., coaching, modeling, and engaging with professional readings) or self-directed (e.g., discussing mutually identified problems, reflection, and inquiry), was consistently associated with improved student success. What was important was the depth of knowledge and skills learned as a result of engagement in the activity or process.

The final shift directs attention to those who support teacher learning within schools or outside of them. Teachers alone cannot solve entrenched problems within our education system; so everyone who has a place in the chain of influence from policy to practice needs to engage in inquiry and knowledge-building cycles to ensure their efforts are effective in developing the kind of professional and student learning that makes a difference. Just like teachers, those responsible for promoting professional learning need to engage in ongoing inquiry into the impact of their policies and practices. This impact is not always positive (Coburn et al., 2009; Datnow, 2005). Fullan (2005) suggests that successful problem solving requires the whole system to be involved in codependent partnerships. Nowhere is this more important than in the area of professional learning. Successful problem-solving involves a process of learning both up and down the system layers.

The remainder of this article unpacks the model developed from the synthesis of the research literature (see **Figure 1**) together with its application in practice and highlights where the shifts described above are particularly important. The whole cycle encapsulates the shifts from professional development to professional learning that involves an active process of systematic inquiry to develop adaptive expertise. Other shifts are particularly relevant to specific dimensions.

Identifying Students' Knowledge and Skills

In order to have an impact on student outcomes, the inquiry and knowledge-building cycle (**Figure 1**) begins and ends with students as described in the third shift in thinking outlined above. Teaching is a highly contextualized activity with teachers constantly responding to the students in front of them. Continuing professional learning that focuses on new practices decontextualized from the immediate demands of student learning in a given teacher's class is not likely to be translated into that environment. Teachers might find the information interesting but rarely apply it given the competing and immediate demands of their students and the curriculum to be taught when they return.

The process of unpacking the question in **Figure 1** "What knowledge and skills do our students need to meet curricula and other goals?" involves asking some specific additional questions that might include:

What do they already know?
What sources of evidence have we used, and how adequate are they?
What do they need to learn and do?
How do we build on what they know?

To answer these questions, leaders and teachers need deep knowledge of how to assess students for the purposes of diagnosis, particularly for those students who do not respond readily to existing instructional practices. For many leaders and teachers this is the first phase of their professional learning as to how to undertake such assessments and how to interpret the information to identify teaching/learning challenges. In many cases, it involves taking a whole new perspective on the purposes of assessment as one of professional inquiry to identify professional learning needs rather than one of grouping, labeling, or credentialing students.

Identifying Teachers' Knowledge and Skills

This second part of the cycle asks teachers to identify what it is they need to know and do to be more effective, particularly with those students achieving less well than others and is central to the aspect of adaptive expertise that asks teachers to become aware of the assumptions underpinning their practice and know when these assumptions are helpful for their learners and when to question them, and if necessary, to let them go. Actively inquiring into and identifying their own learning needs means their further engagement is motivated by the need to know. Much professional development about effective teaching practices is motivated by someone else's desire to tell teachers what they should learn and do.

In the desire to tell approach, policy makers, researchers, or professional development providers believe or have evidence that some kinds of teaching practices are more effective than others. They then create professional development opportunities to inform teachers about these practices without creating the need to know beyond compliance or teacher interest. Some leaders address issues of motivation by calling for volunteers. The synthesis of the evidence on professional learning and development found that student outcomes did not depend on whether teachers volunteered or were expected/directed to be involved (Timperley et al., 2008). In some situations the expectations of volunteers were not met, particularly when the extent of change was greater than they had anticipated. In some other situations the expectations of those who were directed were exceeded. What was more important than initial volunteering was that teachers became engaged in the process at some point. Most engaging was the opportunity to solve puzzling teaching and learning problems related to individuals or groups or learners in the teachers' classes.

The process of identifying one's own professional learning needs is not easy and usually involves the assistance of others because it is difficult to step outside one's own frame of reference. The 'others' may be a school leader or outside facilitator. Specific questions for teachers to answer with a professional learning facilitator might involve:

How have we contributed to existing student outcomes?
With whom are we most effective?
With whom are we not connecting and why?
What do we already know that we can use to promote better outcomes?
What do we need to learn and do to promote better outcomes?
What sources of evidence/knowledge can we utilize?

To answer these questions, teachers need to link their findings from the first dimension of the cycle into students' profiles of achievement to specific teaching practices. It involves taking teachers through a process of unpacking their preconceptions about how students learn and how best to teach them. Why are particular aspects of practice valued? Is what is valued most effective? In order to move on, some key assumptions underpinning existing practice and how they fit with new practice may need to be challenged. Spillane (1999) found, when investigating a mathematics reform in the United States, for example, that if teachers "… are to get to the core reform ideas, [they] have to question, unlearn and discard much of their current, deeply rooted

understandings of teaching, learning and subject matter" (p. 154). Without this kind of examination, suggestions for new practice are likely to be forgotten if they do not fit existing beliefs, or to be assimilated into existing knowledge and practice without a deep understanding what it is that needs to change and why (Hammerness et al., 2005). Hammerness and colleagues refer to this process as one of over-assimilations whereby teachers make superficial changes believing they are making appropriate adjustments to their practice, but do not really understand what this involves, and hence are unable to do so.

This process of examining and critiquing beliefs underpinning particular practices shifts the spotlight from student learners to the teachers. Here, leadership is central because the process is as much about emotions as the acquisition of new knowledge (Hargreaves, 1998). Expectations to change may touch raw nerves because they are likely to impinge on teachers' sense of professional identity and competence while they ask themselves, "Has what I have done before been ineffective?" Stoll et al. (2003) describe how "neglecting emotions can close people to learning, and lead teachers to behave defensively to protect themselves from situations that they feel might expose their 'inadequacies'" (p. 85). Elmore (2004) notes one of the strongest social norms in schools is that everyone is expected to pretend that they are equally effective in what they do even when they feel they are unable to do it. Having to pretend is antithetical to professional learning.

While **Figure 1** implies a sequential identification of student' and teacher' learning needs, in practice this process and all others in the cycle may occur alongside one another. Engagement of teachers' initial understandings occurs throughout the professional learning experience as information is understood more deeply and challenges arise. Learning is iterative rather than sequential.

Deepening Professional Knowledge

This dimension of the cycle foregrounds new knowledge and skills as outlined in the fourth shift in thinking above. It is referred to as "*deepening* professional knowledge and *refining* skills by engaging in further professional learning" because it is assumed that the teachers involved have some experience rather than starting as novices. Professional development events do little more than raise teachers' awareness of new information and rarely lead to changes in practice because much deeper learning is required to change practice sufficiently to make a difference to learner outcomes.

The knowledge identified as important in the synthesis (Timperley et al., 2008) typically involved the integration of knowledge of assessment, the curriculum and relevant aspects of the underlying discipline, and how to teach it. It is only when this knowledge is understood within an overarching conceptual framework of teaching and learning that teachers are able to retrieve and apply it in the moment-by-moment decisions they need to make every day in classrooms.

As with other professions, teaching is practice based; hence, new knowledge is usually insufficient on its own to create change. Ways to translate knowledge into practice needs also to be attended to so that the theoretical understandings become the basis for making ongoing principled adjustments to practice in response to students' learning needs.

When substantial change is required, as is usually the case to make a difference to outcomes for student learners, teachers need multiple opportunities to learn. Through this process, partially understood ideas are revisited as they are tried out in classroom contexts. Over time, understandings are deepened and knowledge becomes more easily retrieved, and skills enacted in the face of daily classroom challenges. Such opportunities to learn require extended time for changes to become a part of the routine of practice.

The specific approaches developed to acquire the relevant knowledge and skills depend partly on the level and kind of professional learning required. Teachers are as diverse in their knowledge and beliefs as their students. If the changes advocated are consistent with existing beliefs and can be readily integrated into existing practice, then less time and engagement is needed than when existing beliefs are dissonant with the ideas promoted through the change. In the latter case, much closer engagement is needed.

Engaging Students in New Learning Experiences

Little is likely to change for students if classroom teaching and learning activities do not change as a result of the inquiry and knowledge development. Changes within the instructional core are those that matter (Elmore, 2004).

Part of the process of continuing professional learning through a systematic inquiry process, therefore, must be to apply new learning in practice and to view efforts to implement new ideas as part of learning. Professional learning cannot be seen as a process of acquiring, then applying new knowledge and skills. Thus, the analysis of classroom practice must be integral to the professional learning process (Timperley, 2011). Leaders play a central role in this process as they observe and support the learning of their teachers to problem-solve together new puzzles that arise.

Assessing Impact

The final question in the inquiry and knowledge-building cycles asks teachers and leaders to assess the impact of any changes on the outcomes valued for the students. It places students at the center once more and contributes to developing adaptive expertise by asking:

How effective has what we have learned and done been in promoting our students' learning?

Impact should be judged on both a lesson-by-lesson basis and more long-term. The contextualized nature of teaching practice – this teacher with this group of student learners in this school – means there can be no guarantee that any specific activity will have the anticipated result. The lesson-by-lesson check assesses immediate understandings of the lesson. Longer-term assessment ensures that the progress made is adequate against agreed benchmarks, and identifies which areas of the curriculum need further work.

The development of this kind of expertise focuses on developing self-regulated learning processes for teachers and allows

them to take "control of their own learning by defining learning goals and measuring their progress in achieving them" (Donovan et al., 1999, p. 23). In the inquiry and knowledge-building cycles, this approach encourages teachers not only to define learning goals and to progress toward them, but also to judge their impact on the outcomes for students.

Assessing impact is not the end of the cycle. As **Figure 1** shows, the arrows keep cycling and continue to redefine what is meant by 'continuing' in 'continuing professional development.' If assessing impact shows previously identified problems persisting, then different approaches to professional learning need to be taken. On the other hand, if the desired improvement is achieved, new challenges are usually identified because the demands of teaching are rarely static.

The Leadership and System Challenge

The research summarized at the beginning of this article that focused on the higher effects of teachers than schools on student learning has led to a focus on teachers and their learning, rather than that of others, such as school and system leaders. Yet, it is difficult for teachers to learn in the ways described above if they work in environments that do not provide conditions that actively promote systematic evidence-informed inquiry and building of knowledge.

While school and system effects are typically much smaller than teacher effects (e.g., Hattie, 2009), recent research on the impact of leadership is moving away from generic school effects to unpacking what makes a difference in leadership practice to outcomes for students. This research has contributed to a growing consensus that particular leadership practices have greater effects on outcomes for students than others (Supovitz et al., 2010; Robinson et al., 2008). Robinson et al., for example, identified five dimensions that were particularly important in this regard. They found that leadership practices involving promoting and participating in professional learning and development had twice the effect sizes of other practices (ES = 0.84). The others (with effect sizes noted in brackets) included establishing goals and expectations (ES = 0.42); resourcing strategically (ES = 0.31); planning, coordinating and evaluating teaching and the curriculum (ES = 0.42); and ensuring an orderly and supportive environment (ES = 0.27). This research provides a strong justification that continuing professional development for teachers is more likely to be effective for student learners if it is promoted by leaders. This role is variously described as instructional leadership, pedagogical leadership, or leadership for learning (Timperley and Robertson, 2011).

Leadership involvement in continuing professional learning is particularly important for sustainability of improved outcomes for student learners by making cycles of inquiry and knowledge-building core business for those responsible for student learners (O'Connell, 2009; Timperley, 2012). Although the research base is relatively recent and still developing, the ongoing gains in outcomes are more evident in continuing professional learning initiatives that develop adaptive expertise than those that do not (e.g., Lai et al., 2009; O'Connell, 2009). Challenges that arise are treated as problems to be solved and addressing them through an inquiry framing becomes part of each school's organizational routines (Newmann et al., 2001).

The research findings about the impact and practices of school leadership cited above can be extended logically to include network, district or local authority leadership. I began this article with the limitations of continuing professional development in realizing policy goals of raising the bar and closing the gap. A difficulty that often arises is the limited understanding at different system layers about approaches that are likely to make a difference. Many persist with one-off workshops and conferences with little follow-through to ensure that what is happening is making a difference. Even more of a problem are those policy environments that create conflicting policy demands and withdraw funding just as the professional learning is gaining traction for student learners (Coburn et al., 2009; Datnow, 2005). On the other hand, policies and practices that promote an inquiry and knowledge-building approach to continuing professional learning, focused on developing adaptive expertise, are more likely to have greater impact than approaches that are inconsistent with the principles and practices outlined above (Lai et al., 2009; McNaughton et al., 2004).

Conclusions

Schools, and those who teach in them, increasingly face a myriad of challenges. Learner demographics, curriculum, and technologies are all changing. Job and life opportunities for learners are also changing, so educating only those who readily engage with existing approaches to teaching and learning is no longer acceptable. While continuous professional learning for teachers has the potential to help them to make the changes in approaches to teaching and learning to meet these demands, teachers cannot do this in an environment where others decide what is good for them and tell them what to do through workshops, conferences, or one-off sessions. Nor is there much evidence to support the idea that teachers can identify, by themselves, what they need to learn independently of a supported analysis of what their students already know and need to learn, accompanied by a systematic assessment of their own capabilities, to meet the challenges that are identified.

In this article I have outlined some of the shifts in thinking that underpin the effective enactment of a systematic inquiry and knowledge-building approach to continuing professional learning with a proven record of improvements in student engagement and learning. These shifts included moving from professional development to professional learning; from defining professionalism as developing routine expertise to developing adaptive expertise; from learner engagement and learning being a 'hoped for by-product' to having these issues central to the process; and finally from a focus on the teachers to a focus on the system that supports their learning. The biggest shift in thinking, however, is that professional learning must become seriously continuous in the sense of becoming core business for every teacher in every school and educational jurisdiction, if we are to make the difference that the student learners who are required to attend our schools deserve.

Contractarianism

Alan Hamlin, University of Manchester, Manchester, UK

© 2015 Elsevier Ltd. All rights reserved.

Abstract

Contractarianism and contractualism identify a range of positions in moral and political theory that is distinctive in terms of its emphasis on considerations of individualistic eligibility: social, political, or moral rules, norms, or institutions are to be explicated and justified by appeal to the extent to which they would be chosen, at least by certain types of agents in certain situations. Classical contractarianism was developed by Hobbes and Locke, and by Rousseau and Kant, and a range of contemporary contractarian and contractualist positions emerged in the second half of the twentieth century to challenge utilitarian and other idealist approaches to political and moral philosophy. Classical contractarianism is often identified with an apparently false belief in a real historical contract, or with a deeply problematic relationship between a hypothetical contract and the real world. Contemporary contractarianism and contractualism are more heuristic in their use of the idea of agreement, using the notions of contract and agreement as a means of investigating social, political, and moral questions. Contemporary contractarianism sits in the broadly Hobbesian tradition and takes individual interests as basic, seeking to explore the prospects for mutual advantage among rational individuals. Contemporary contractualism sits in the broadly Kantian tradition and emphasizes the rational contemplation of social, political, or moral questions from an impartial perspective as the appropriate means of investigation. Both traditions face issues of analyzing the nature of *ex ante* agreement; the basis for *ex post* compliance; the relationships between the individual, the social, the rational, and the moral; and the connections with ideas such as individualism, democracy, and pluralism.

Introduction

The voluntary act of entering into a contract or agreement may be understood as the act of choosing to be involved with others in a specified joint venture or commitment. Any argument that places an idea of contract, agreement, or consent in a central role in explaining or justifying a particular joint venture or commitment might then be seen as broadly 'contractarian' in nature. Most prominent among the joint ventures and commitments that might be explained or justified are political, social, and legal institutions including government, and moral values. Broadly contractarian arguments are distinctive in terms of their emphasis on considerations of eligibility, so that demonstrating that a particular arrangement or commitment was, or might have been, chosen, at least by certain types of individuals in certain circumstances, carries weight in explicating and justifying that arrangement or commitment. Contemporary contractarian and contractualist arguments differ from each other along several dimensions, most obviously according to the basis of agreement or consent, the domain of the argument, the role of the idea of a contract or agreement in the argument, and the specific nature of the relevant contract. These dimensions map out a space that includes many positions. Not all points in this space are tenable, but a number of them are occupied by contemporary contractarians and contractualists.

In the dimension associated with the basis of agreement or consent, the most fundamental distinction is that between those who, following Hobbes, locate agreement in individual interests and mutual advantage, and those who, following Kant, locate agreement in an impartial assessment. It is this distinction that is tracked by the contemporary use of the terms 'contractarianism' and 'contractualism' respectively.

In the domain dimension, a modest contractarianism or contractualism would seek to explain or justify some particular activity, norm, or other aspect of social life against a background that already includes a rich variety of social institutions and norms. By contrast, a moderately ambitious or *political* contractarianism or contractualism seeks to explain and justify basic social and political institutions themselves, rather than merely the activities that occur within them. Finally, a highly ambitious or *moral* contractarianism or contractualism seeks to provide a theory of morality itself.

In the dimension that identifies the role of agreement in any contractarian or contractualist argument, we note two major possibilities: agreement might play either a shallow, indicative role or a deep, constitutive role. An indicative role might be relevant in cases where the agreement serves as a useful but inessential signal of some further and more basic property (the signal may be sufficient but not necessary for the realization of the underlying property). By contrast, agreement could play a deeper, constitutive role where the idea of contract is essential to the argument (so that the contract is both necessary and sufficient).

In the dimension that identifies the specific nature of the relevant contract, the most obvious range extends from the case of the fully explicit, actual, or historical agreement, to various specifications of tacit, implicit, or hypothetical agreements. But there is also scope for qualifying the nature of agreement in other ways. Thus, some contractarian or contractualist arguments will emphasize the informational context of agreement, the extent to which agreement is grounded in fully rational deliberation, or the extent to which agreement could be reasonably rejected.

The basic idea or vision that unites all contractarian and contractualist thought is the conception of society (in the case of political contractarianism) or morality (in the more ambitious case) as human constructions, so that, for example, society is 'a co-operative venture for mutual advantage' (Rawls, 1971, p. 4). This places contractarianism and contractualism in

a broadly individualist setting in which society or morality is to be explained and justified by appeal to the extent to which it responds to human needs, supports cooperation, and suppresses various forms of conflict.

In the Hobbesian contractarian tradition the interests of individuals are taken as basic so that agreement is seen as identifying mutuality of interest. The most basic version of such a theory would begin in a presocial state of nature, allow individual interests to be whatever the individuals concerned perceive them to be, and require real, explicit, and unanimous agreement between individuals. Such a theory is open to a range of obvious criticisms: that agreements based on mistaken or misperceived interests cannot carry the normative weight required by the argument; that since explicit, historical agreements of the required type are not a common feature of the real world, the contractarian argument cannot explain or justify the actual political or moral features of the real world; and so on. The point to be emphasized here is that, notwithstanding the success of these criticisms against the most basic form of Hobbesian contractarianism, more sophisticated versions of the idea of contract or agreement are important as a means by which to investigate the prospects for mutual advantage for rational individuals.

In the Kantian contractualist tradition, attention shifts from mutual advantage to impartiality. The basic idea here is that the rational contemplation of the world from an impartial standpoint will reveal what political arrangements are just or what is moral. There is no fundamental attempt to link the contractualist idea to real, explicit agreements. The essential nature of the Kantian contractualist method is to construct a hypothetical, impartial position from which to consider what is just by asking what might be rationally chosen or agreed from that position.

Contract and Compliance

Although the possibility of cooperation is a hallmark of the vision of society in both the Hobbesian contractarian and Kantian contractualist approaches, it is the nature of the conflict that threatens cooperation that sets the more detailed agenda. This agenda may be illustrated by a sequence of simple games that have become staples of the literature – the pure coordination game, the mixed-motive game, and the prisoners' dilemma. In developing these illustrations, I will use the language of a simple Hobbesian, interest-based contractarian argument, where the contract is explicitly entered into.

In the pure coordination game, each player has an interest in coordinating with others, and no other relevant interest. This is illustrated in the simple two-person, simultaneous-play game of Figure 1, where the payoffs from each combination of actions are shown in the form (payoff to row, payoff to column).

All that matters in this game is that the two players should take the same action – both should X, or both should Y – since the interests of the two players are perfectly aligned. In this setting, it is easy to see how preplay communication between the players might allow an agreement that identifies a *convention* in the sense of Lewis (1969). So there is little difficulty in identifying the potential grounds for agreement (although there might be a minor difficulty in identifying which of the actions is to be coordinated on). It is equally easy to see that such an agreed convention will be self-enforcing in that neither player has any reason to depart unilaterally from the convention once it is established. There is no individual compliance problem here. This, then, is a model in which a simple contractarian argument promises to work well – the agreement seems likely to pick out social or political conventions that are self-enforcing in the relevant population. However, the obvious criticism is that a model of pure coordination is an inappropriate starting point for even moderately ambitious political contractarians since, although it may capture the essential features of some social and political issues, it can hardly claim to capture the fundamental nature of society where both competition and conflict must be recognized.

A move toward incorporating conflict is made in Figure 2, which represents the mixed-motive game. The benefits of cooperation are still clear – each player still has an interest in doing what the other does – but now the two players have divergent interests concerning the action to coordinate on. Row has an interest in coordinating on X, while Column has an interest in coordinating on Y. This introduces a difficulty into the contractarian argument: that any preplay agreement must now overcome an essential conflict of interests. If we are willing to assume that some agreement is reached, we might still argue that such an agreement forms a convention and is self-enforcing. Consider the case in which Row and Column agree that both should X; Column now has good reason to suppose

		Column	
		X	Y
Row	X	(1,1)	(0,0)
	Y	(0,0)	(1,1)

Figure 1 Pure coordination.

		Column	
		X	Y
Row	X	(2,1)	(0,0)
	Y	(0,0)	(1,2)

Figure 2 Mixed motives.

		Column	
		X	Y
Row	X	(2,2)	(0,3)
	Y	(3,0)	(1,1)

Figure 3 Prisoners' dilemma.

that Row will X and, given this belief, Column will also have good reason to X. There may be no individual compliance problem here despite the *ex ante* conflict between players.

A further step in the direction of conflict is illustrated in the standard prisoners' dilemma game of Figure 3. Here each individual has a private reason to Y, since this is the dominant strategy. The potential and mutual gains from cooperation in this case come from shifting the behavior of *both* players from Y to X. In a sense, the problem here is the opposite of the problem in the mixed-motive game. The nature of any agreement seems clear enough, precisely because the coordinated shift from Y to X does offer mutual benefits, while no other route to mutual benefits exists. But now the existence of a severe compliance problem may undermine any agreement to X. If both agree to X in preplay negotiations, it is not clear that either will comply with the agreement, since it will be in their individual interests to renege on the agreement regardless of whether they believe the other will keep to the agreement (this is just what it means to say that Y is the dominant strategy). The preplay agreement may be dismissed as 'cheap talk' that does not actually affect individual decision making. If the compliance problem is so severe as to render prior agreement ineffective, there will be no reason for individuals to waste their time in reaching ineffective contracts.

These simple illustrative games serve to identify two of the basic issues facing contractarians and the relationship between these issues: on the one hand, the issue of the nature and content of any agreement given the likely presence of *ex ante* conflict between individuals and, on the other, the issue of compliance with any agreement given the *ex post* conflicting private incentives facing individuals.

Contemporary Contractarian Positions

We have identified two broad traditions – the Hobbesian interest-based contractarian tradition and the Kantian impartiality-based contractualist tradition – and two broad issues: the *ex ante* agreement issue and the *ex post* compliance issue. The remainder of this article will briefly consider contemporary contractarian positions – representing both traditions and offering different approaches to the basic issues. The intention is both to sketch some salient features of contemporary debate and to reveal some of the strengths and limitations of contractarian and contractualist argument.

Hobbesian Contractarianism – Buchanan and Gauthier

Both Buchanan's and Gauthier's contractarianism are clearly and explicitly Hobbesian in nature, but an initial difference between these two contemporary contractarians lies in the scale of their ambition. Buchanan ties his contractarian argument to political constitutionalism, so we might view Buchanan as an essentially *political* contractarian. Buchanan takes contractarianism as providing a justification for political and constitutional structures, rather than merely an explanation, so that he is committed to contractarianism as a means of moral enquiry; but he does not set out to derive any specific or substantive moral principles from the idea of agreement. Buchanan is certainly a moral individualist, but he may be interpreted as allowing individuals to hold whatever moral views they may happen to have (including none at all), insisting only that agreement or contract is the means by which individual moral values, as well as individual desires or preferences, must be brought together in any exercise in normative social or political theory. By contrast, Gauthier's ambition is that of a full-scale moral contractarian. *Morals by Agreement* sets out an argument (with many of the details revised and extended in later work) for the contractarian construction of morality. More specifically, "Moral principles are introduced as the objects of fully voluntary *ex ante* agreement among rational persons. Such agreement is hypothetical … But the parties to the agreement are real, determinate individuals, distinguished by their capacities, situations and concerns … As rational persons understanding the structure of their interaction, they recognize a place for mutual constraint, and so for a moral dimension in their affairs" (Gauthier, 1986, p. 9). These differences in ambition between Buchanan and Gauthier relate to further differences in the treatment of both *ex ante* agreement and *ex post* compliance.

A basic distinction in Buchanan's argument is that between 'constitutional' and 'in-period' choices. Constitutional choices are described as choices of rule systems, while in-period choices are described as choices within rules. The *ex ante* agreement issue, for Buchanan, is then the question of why individuals who may differ markedly in their interests (and values), and in their in-period motivations and behavior, may nevertheless agree on rules. Buchanan's approach to this issue focuses on considerations of the nature of the objects of choice rather than the choosing agents. As already noted, Buchanan does not impose on his individuals any restriction in the set of interests or values that they might have. On the contrary, Buchanan frequently insists that 'we start from here' and that individuals must be taken 'as they are,' recognizing their diversity. Rather, Buchanan argues that the nature of constitutional choice itself will present alternatives in such a way as to reduce conflict between individuals, and so enhance the prospects for agreement. One key element of this argument is that constitutional provisions are 'general' in that they are expected to apply both across many particular in-period choice situations and across time, so that any individual contemplating the choice between rule systems will have good reason to judge the alternative rule systems in terms of their more general properties, rather than in terms of the implications for any particular in-period decision.

Thus, for example, in choosing a voting rule to be applied to a broad class of in-period political decisions, any individual at the constitutional stage will have good reason to balance the implications of each potential voting rule across a wide range of issues, and this suggests that different individuals may judge voting rules similarly, even if their specific preferences or values are rather different. This argument seems secure; surely the move from the level of the particular in-period decision to the more abstract constitutional level will tend to suppress at least some of the potential conflict between individuals and so allow potential agreement. However, this apparent success in at least diluting the *ex ante* agreement problem may simply transfer the problem to the arena of compliance. The *ex ante* agreement problem is still more severe for Gauthier. To the extent that Gauthier simply argues for the 'recognition of mutual constraint' at the *ex ante* level, there is no substantial difference between Gauthier and Buchanan – 'mutual constraints' may be identified with constitutional rules without much loss. However, Gauthier needs to go a step further to argue that individuals will come to agree on moral principles rather than just particular, institutionalized constraints or rules. To take this extra step, Gauthier relies on a particular model of bargaining (although the specific theory of bargaining is an area in which Gauthier has revised his views) and a version of the Lockean proviso. The proviso is of particular interest since it seems to be a moral principle, but is not argued to arise out of agreement. It is, rather, a precondition for agreement. Essentially, the proviso states that initial bargaining between individuals should be constrained so that no individual should be worse off in the initial bargaining situation than they would be in a nonsocial context of no interaction. This effectively introduces a minimal set of rights into the original bargaining situation. Gauthier argues that such a proviso has to be accepted by each individual if agreement is to be possible. In one sense, this proviso might be thought of as a technical device to ensure that the bargaining outcome actually realizes mutual advantages, and therefore stays true to the underlying Hobbesian idea; but in another sense, it reveals a potential weakness of any bargaining model in that the outcome will reflect bargaining power relative to some baseline 'rights.' If such power is to be viewed as illicit in some cases – and ruled out by the proviso – why should the outcome of power be granted moral status in other cases?

The basic compliance question for any Hobbesian contractarian is simply why any individual should feel him- or herself to be bound or obligated by a prior agreement (whether on political rules or moral principles), even if that agreement was explicit and real. This question may be put in terms of the *ex post* motivational impact of the *ex ante* agreement, and whether the motivational impact is sufficient for the agreement to be self-enforcing. If interests are the currency of both *ex post* decision making and *ex ante* agreement, it would seem to place these two activities on all fours with each other so that the claimed priority of the *ex ante* contract over the *ex post* decision is threatened.

The prospects for wholly self-enforcing contracts seem to be hopeless if either we are to take individual interests as being entirely unspecified, so that any individual may have any interests at all, or we insist on interests being modeled in terms of narrow self-interest along the lines of the standard depiction of *Homo economicus*. In either of these cases, the fact of the contract (if it is a fact) and the content of the contract (whatever it might be) would seem to have no independent or reliable role in determining in-period behavior in situations such as the prisoners' dilemma where in-period incentives are clear. In order to generate reliable compliance in such cases, we seem to need to assume at least some motivational relevance or status for the contract itself or the rules or principles that derive from that contract. Without such a move, the range of political and moral principles that might be explained or justified by a Hobbesian contractarian would seem to be limited to those that can be analyzed as self-enforcing conventions (see Hardin, 2003). Gauthier attempts such a move by arguing for what he terms 'constrained maximization' rather than straightforward maximization as the appropriate interpretation of rational decision making, where "A constrained maximizer has a conditional disposition to base her actions on a joint strategy, without considering whether some individual strategy would yield her greater expected utility … in other words, a constrained maximizer is ready to co-operate in ways that, if followed by all, would yield outcomes that she would find beneficial and not unfair, and she does co-operate should she expect an actual practice or activity to be beneficial" (Gauthier, 1986, p. 167). The basic point here is that Gauthier is attempting to ground his moral contractarianism in a specific interpretation of what rationality requires. The detailed claim about rationality is clearly contentious, but without some similar claim, there would be little prospect for contractarianism that goes much beyond the securing of conventions.

A second aspect of the question of compliance relates to the possibility of enforcement. Clearly this is of much more relevance to a political contractarian than a moral contractarian since a moral contractarian must by necessity be concerned with the acceptance and internalization of moral principles, but, even for a moral contractarian, it is clear that enforcement may play some role. So, can enforcement resolve the compliance problem? As usual, the answer is both yes and no. Of course, the possibility of more complex contracts that include enforcement mechanisms will extend the range of political and social situations that can be treated. Such complex contracts need raise no new issues at the *ex ante* stage. For example, if a group of individuals contract to engage in a joint venture that has the characteristics of providing a public good (the draining of a swamp, perhaps), it will be appropriate for them to recognize that a simple contract in which each person agrees to contribute to the in-period effort and cost may founder since each individual will face strong in-period incentives to free-ride. In such a case, a form of enforcement, perhaps raising taxes against the credible threat of some further punishment if taxes are not paid, seems to both solve the *ex post* compliance problem and be something that offers appropriate mutual advantage so that it will be eligible at the *ex ante* stage. However, this is too fast. Enforcement of the type required cannot simply be assumed to be available. Typically, enforcement requires enforcers, and their motivations and decisions must be explicitly considered. Assuming that judges will virtuously apply the law, or that police officers will act regardless of their own individual interests, is not to solve the compliance problem but simply to relocate it. This is not to

deny that enforcement is sometimes possible and useful, but merely to suggest that while a political or social arrangement may involve enforcement within its structure, the structure as a whole must be seen to be self-enforcing in the sense that the behavior of all individuals – including those who act as enforcers – are seen to be consistent with their motivational characters and the incentives facing them.

Kantian Contractualism – Rawls and Scanlon

Some of the discussion of the Hobbesian positions of Buchanan and Gauthier applies with only minor modification to the Kantian positions of Rawls and Scanlon. In this Section, I will concentrate on rather different concerns to avoid repetition.

The Kantian nature of Rawls's contractualism is most obvious in the formulation and discussion of the original position. This position, with its relatively thick veil of ignorance, is the basic means by which Rawls attempts to overcome the potentially conflictual nature of the *ex ante* agreement and generate the impartial conditions under which to explore what justice requires. To (over)simplify, the original position attempts to strip away all of the distinctive and partial characteristics of specific individuals, their particular circumstances and interests, and so on, thus reducing the extent of conflict between individuals. In the limit, this process reduces the idea of rational agreement among individuals in the original position to the idea of the rational choice of a single hypothetical and representative individual. This then places almost the entire burden of identifying the institutions and principles that should govern society on the idea of rationality. The danger here is that the original position must satisfy two rather conflicting conditions. On the one hand, it must be sufficiently removed from the real world to satisfy the requirement of impartiality, that is, it must strip away almost all the recognizably human aspects of the individual, while on the other hand it must retain sufficient structure to allow the idea of rationality and rational choice to be meaningful and recognizable. This is no trivial task. The standard thin theory of rationality favored by economists and seemingly endorsed by Rawls is one in which rational choice is defined in terms of the desires and beliefs of the particular individual; in the absence of specific desires and beliefs, it is not clear what the thin theory of rationality entails.

Scanlon's contractualism differs from that of Rawls in several key respects – first, in terms of its ambition, where Scanlon is explicitly more ambitious than Rawls in arguing for a moral rather than a merely political contractarianism; and, second, in his formulation of the idea of *ex ante* agreement, which makes no major use of the construction of an original position. Scanlon offers the following definition of his account of contractarianism: "An act is wrong if its performance under the circumstances would be disallowed by any system of rules for the general regulation of behaviour which no one could reasonably reject as a basis for informed, unforced general agreement. This is intended as a characterization of the kind of property which moral wrongness is" (Scanlon, 1982, p. 110). Contractarianism, in this view, is concerned with providing a distinctive basis for moral reasoning by individuals. Thus, for example, "A satisfactory moral philosophy will not leave concern with morality as a simple special preference, like a fetish or a special taste, which some people just happen to have. It must make it understandable why moral reasons are ones that people can take seriously" (Scanlon, 1982, p. 106); and, again, "According to contractualism, the source of motivation that is directly triggered by the belief that an action is wrong is the desire to be able to justify one's actions to others on grounds they could not reasonably reject" (Scanlon, 1982, p. 116). This formulation ties together the *ex ante* agreement and *ex post* compliance issues in a particular way. By formulating the idea of agreement in terms of principles 'which no one could reasonably reject', Scanlon allows a degree of flexibility – there is no argument to suggest that there exists a unique set of principles that could not be reasonably rejected – and so weakens the requirement of agreement in Rawls' formulation. But, at the same time, the specification that the hypothetical 'agreement' (or nonrejection) is something that occurs in the minds of real individuals (rather than individuals in an original position) who are also motivated to justify their actions to others provides a route to compliance. It is the desire to justify action to others that drives the motivational side of the problem, and the requirement of 'reasonableness' in the nature of justification that bears the strain in terms of identifying particular justifying arguments. But the dangers here are clear: that the desire to justify my action to others is simply smuggled in as a 'simple special preference like a fetish or a special taste,' which is not itself grounded in any contractarian logic, and that the idea of 'reasonableness' is insufficiently detailed to bear the strain placed on it.

There is a final concern that is shared by moral contractarians and contractualists, whether Hobbesian or Kantian. Even if we grant that it may be possible to parlay rational agreement, in whatever interpretation of that phrase, into moral principles, will the moral principles that emerge be recognizable as our moral principles? In particular, will the resources of contractarianism or contractualism be sufficient to ground the range of moral views that we actually have, and, if not, what would be the implications of that fact? Would it point to the possibility that some of our 'moral' views are not really moral after all, but mere tastes or preferences? Or would it point to the possibility that there may be other means by which moral principles may be grounded, so that agreement might not be the only means of approaching moral principles? Of course, this issue arises only once substantive moral principles have been derived from the contractarian method, and there is certainly no consensus as to precisely which substantive moral principles can be so derived.

Finale

Contemporary contractarianism and contractualism offer approaches to political and moral theory that share as their basic commitments a form of individualism and the recognition of the central role of rationality in human affairs. In a simple sense, contractarianism is dedicated to the question of how rational people can live together. This simple and appealing structure goes a long way to explaining the continuing appeal of contractarianism. Further refinements in contractarian and contractualist thought are available. For

example, Southwood (2010) offers a discussion of 'deliberative contractualism' which, he argues, overcomes at least some of the limitations of both Hobbesian contractarianism and Kantian contractualism by focusing on an account of rationality that embraces deliberation rather than either individual interests or the impartial perspective.

However, not all accept the basic vision underpinning contractarian and contractualist thought. Communitarians and others who take society as prior to the individual, for example, must object to contract thinking in all of its forms by reason of its underlying individualism. Equally, not everyone accepts that the basic idea of eligibility is compelling or even interesting. A question to all such critics of contractarianism and contractualism is how they might expect to persuade individuals (even beyond the range of philosophers and political theorists) that their preferred alternative is valid without falling into a form of contractarianism themselves. For if a particular substantive moral theory or political constitution can be justified to others, it might be presumed that it could be derived by a contractarian argument that emphasizes that mode of justification. This is simply a way of pointing to the fact that debate between contractarian and contractualist accounts and others is sometimes guilty of a mismatch between the contractarian method and particular substantive positions that might, at least in principle, be derived from that method.

Contemporary contractarianism and contractualism are engaged in the study of the relationships between the idea of rationality, the nature of individual interests and dispositions, self-interest and morality, political and social rules, and moral psychology. While there are many areas in which these relationships are still obscure, and while there are surely noncontract approaches that may prove rewarding, it seems difficult to deny the importance of these relationships, or the potential of the contractarian and contractualist enterprise to illuminate them.

Contracts: Legal Perspectives

Leon E Trakman, University of New South Wales, Sydney, NSW, Australia

Abstract

This article analyzes the common law of contracts from both legal and social behavioral perspectives. Section Contracts in Common and Civil Law Systems distinguishes between contract law in civil and common law systems, giving primary focus to the common law – or 'judge made' law – of contracts. Section Freedom to and Freedom from Contracts identifies the often seemingly irreconcilable ideological tension between the freedom of parties to and the freedom of parties from contracts. It illustrates that this tension is manifest differently according to the type of contract, such as business and consumer contracts. It also suggests that this ideological tension over contractual freedom often transcends the kind of contract in issue, focusing instead on competing conceptions of fairness and efficiency in judicial practice. Section The Judicial 'Management' of Common Law Contracts evaluates how judges manage contracts. It identifies different methods by which they do so, such as by interpreting contracts according to the contract text, or by implying terms into those contracts. It evaluates the perceived strengths and limitations of these methods, including the critical view that contract law can perpetuate social and economic advantage more than redress them. The conclusion is that competing conceptions of contract law, and the role of common law judges in construing them, will continue. However, these tensions are preferable to complacency or resigned acceptance of the status quo.

Introduction

A contract is a legally recognized agreement between two or more parties, which is binding and enforceable in law, the default or 'breach' of which gives rise to legal liability. The usual remedy in common law contracts for breach is expectation damages for a loss of profit or other benefits arising from the breach (Fuller and Perdue, 1936; Macneil, 1982). However, 'equitable remedies' such as injunctions and specific performance are sometimes also available.

A contract is formed if the parties consent to contract. Consent in the common law system entails one party making an offer to the other party, which that other party accepts, and the parties exchange valid consideration for their mutual promises. In addition, the material terms of the contract must be certain. Nor may they be illusory in a material respect, as when one party retains an unfettered discretion to decide whether or not to perform an obligation assumed by contract.

Some contracts are required to comply with legal formalities, such as the registration of the sale of land and marriage contracts, or the requirement that a contract be in writing and signed by the parties or their agents. However, contracts in general are not required to be formally executed. Informal agreements, such as entered into by business parties over lunch, may well be binding if the parties actually or reasonably intend to be bound by them (Macaulay, 1963).

A contract can be set aside due to a 'defect' in consent. For example, a common law court may nullify a contract arising from a fraudulent misrepresentation, such as when a seller knowingly misleads the buyer into buying a valuable work attributed to Picasso, which is actually a forgery. A court may set a contract aside because of a common mistake, such as where both parties are under the mistaken belief that the painting is a Picasso.

Parties to contracts ordinarily can enforce them. However, in limited circumstances a court will hold that a contract is not enforceable because it offends good morals, is against public policy, or violates a statute or administrative regulation.

Parties to contracts are required to perform their contractual obligations. A party can terminate a contract if the other party is in default, as when a seller delivers materially defective goods under a contract of sale. A contract can also be rendered unenforceable for frustration, as when an unforeseen circumstance reasonably beyond a party's control, such as a war, renders that party's performance impossible or unduly burdensome.

Social arrangements, such as an agreement to attend a family or social gathering, are ordinarily not binding in law and have no legal consequences. However, they may have moral, social, or economic significance (Coleman, 1980). In addition, so-called socially responsive courts may be influenced by such arrangements, such as when they are interpreting contracts in light of their social and economic context (Macneil, 1980; Pound, 1908).

Contracts in Common and Civil Law Systems

Contract law in civil law jurisdictions (across Europe, Latin America, Japan, China, and parts of Africa) is largely codified and is part of the civil law of 'obligations.' Courts in civil law jurisdictions, in turn, apply the articles of applicable civil law codes in deciding particular contract cases. Commentary on those provisions by jurists, the so-called *opinio juris*, further elucidates upon their meaning and application in particular disputes. As a result, the civil law system of obligations is conceived as being primarily deductive in nature: the law applied in particular cases is deduced from general principles of law, which are contained in codes of law and elucidated upon by jurists (von Mehren).

In contradistinction to civil law codes, common law contracts (in the British Commonwealth and the United States) are primarily judge made. Common law judges develop principles, standards, and rules of law deductively to govern the formation, performance, and termination of contracts. Unlike in civil law jurisdictions, common law

legislatures ordinarily play only a secondary role in regulating contractual relations. However, there are increasingly significant codes in common law jurisdictions that regulate particular kinds of contracts, such as the Uniform Commercial Code in the United States regulating, among others, contracts of sale and secured transactions (Llewellyn, 1930). There is also legislation across all common law jurisdictions regulating particular kinds of contracts such as related to banks and insurance companies, or particular kinds of parties such as employees and consumers.

Civil and common law systems predominate globally. Not atypically, both Japan and China adopted the German civil law governing the law of obligations. However, the Chinese law of obligations is also significantly influenced by Taiwanese law. In many jurisdictions, too, customary laws regulate family contracts and further augment the civil or common law.

It is important in the understanding of common law contracts to also appreciate the differences from civil law obligations, and in particular cases, customary laws of contracting. Given that we occupy a 'global village,' many transactions are conducted between parties conducting their dealings across national and legal boundaries. Traditionally, such transactions were limited to merchants who in bygone times developed a distinct transnational law merchant to govern their dealings. Today, contracts are conducted across national boundaries by hosts of nonmerchants, such as by purchasers of goods and services over the Internet. These technological developments establish the importance of having an international body of contract law or obligations that is capable of transcending national boundaries and regulating global commerce in a comprehensible, efficient, and fair manner (Trakman, 2009).

For practical purposes, this article concentrates upon the role of courts in common law system of contracting, unless it provides expressly otherwise.

Freedom to and Freedom from Contracts

There is ongoing debate, in both common and civil law systems, over the extent to which contracts ought to be subject to regulation. The traditional nineteenth-century view was that the law should protect the freedom of parties to contract by enforcing their subjective 'wills' or intentions (Williston, 1921). According to this view, legislative, administrative, and judicial regulations that interfered with the 'wills' of the parties undermined their consent to contract and led to courts improperly 'making' or 'unmaking' contracts. As a result, common law courts in the nineteenth and early twentieth centuries enforced agreements according to the subjective intention of the parties. For example, they determined whether the parties had actually exchanged promises, rather than whether it was reasonable for a court to assume that they had done so. In the absence of clearly expressed wills of one or both parties, common law courts of that era determined that there was no *consensus ad idem* between the parties, no 'meeting of the minds,' and no contract (Williston, 1921).

This preoccupation with the freedom of parties to contract continues to influence the common law of contracts and to a lesser extent, the civil law of obligations in the latter half of the twentieth century and today. However, the so-called 'wills theory' by which parties concluded contracts has receded in importance. Courts are less likely to insist that the parties must express their subjective wills clearly and completely in order for agreements to be enforced. They have sought instead to determine whether the parties intended to enter into contracts based on the reasonable intention of the parties, in the absence of clearly or completely articulated wills. They also increasingly consider the social context surrounding contracts, such as the family or commercial setting in which parties concluded family or commercial contacts (Pound, 1908).

A judicial tension in common law jurisprudence relates to the parameters of an objective theory of contracting. Some courts construe the objective theory restrictively, requiring objective evidence of an intention to contract within the text of the contract, thereby limiting themselves to the contractual language used. Others construe contract terms more expansively in light of the practices of the parties, the usages of their trade, and expansive customs. Other judges are more audacious still, constructing contract terms according to whether, in the court's opinion, it is expedient or fair to do so in the circumstances. This tension between narrow textual and broad contextual interpretation of contracts is reflected in judicial attempts to construe – and sometimes construct – contract terms to redress structural and functional bargaining inequalities between contracting parties. For example, a court may interpret an onerous term in a contract literally according to its 'plain word meaning,' such as by interpreting literally, in favor of the employer, a term entitling an employer to dismiss its employee without cause, or by interpreting literally, in favor of the landlord, a term permitting a landlord summarily to evict a tenant. Alternatively, a court may construe such onerous terms in favor of the employee or tenant, respectively, according to standards of due process and fair notice that the court implies by law or fact into employment and tenancy contracts. The judicial object, often reinforced by statute, is to protect vulnerable sectors of society from being unduly subjugated to 'adhesion' contracts drafted by dominant parties (Kessler, 1943).

Such judicial protection of vulnerable contracting parties is by no means new in common law jurisprudence. Already in the nineteenth century, the Court of Chancery in England, responsible for equity, sought to protect mine and factory workers from being forced to accept unreasonable work conditions.

This concern to protect disadvantaged sectors of the economy from contractual exploitation was reinforced in the mid-twentieth century, with the growth of the modern welfare state and the commitment of democratic states to protect consumers in general. Notable among such developments were codified efforts, such as expressed in the American Uniform Commercial Code, to ensure that contracts for the sale of goods were not unconscionable (Llewellyn, 1930). Statutory developments in other common law jurisdictions sought to address such unfairness through specific legislation such as the Unfair Contracts Act in the United Kingdom and the Consumer Protection Act in Australia in 2011. Further legislation protects employees, among other vulnerable groups.

The result is the development of significant bodies of law that are 'made' by judges in interpreting or construing statutes,

and sometimes, in constructing terms beyond those statutes. For example, judges sometimes determine when an employer has unfairly limited by contract its liability for work-related injuries suffered by employees, and less readily, when an insurance company has imposed unduly onerous duties of disclosure by contract upon an insured in order in denying subsequent insurance claims.

Perhaps most frequently, judges have developed principles, rules, and standards to regulate the conditions under which mass producers of consumer goods can exclude liability by contract, such as for defects in computers sold *en masse* to consumers in mass markets (Trakman, 2009).

One result of statutory and common law developments governing different sectors of the economy, such as employment, insurance, and consumer affairs, is the perception that there are different laws of contract applicable to different kinds of contracts or parties. For example, the law of contracts that judges apply to merchants is sometimes conceived as being different in kind and degree from the law of contracts judges apply in family transactions. This distinction is overstated, given that the principles of contract law developed by courts, and glossed by legislation, are ordinarily applied to contracts in general, regardless of the discrete kind of contract in issue. However, it is arguable that courts are more reluctant to 'interfere' with a bargain struck between comparatively equal parties (such as experienced merchant traders) than with one between parties with unequal bargaining power, particularly when the consent of the inferior bargaining party is in question (Bernstein, 1966).

Disparities in bargaining power between parties are nevertheless not necessarily grounds for courts 'interfering' with bargains. Common law rules of construction, such as the rule of construction that contracts ought to be construed against the drafter, usually the dominant party, are mere guidelines; rules of construction are not binding rules of law. Conversely, courts sometimes impose rules of fairness in so-called merchant contracts to prevent one party from being subjected to misrepresentation or unconscionable conduct by the other party, even though both parties are sophisticated traders.

More contentious perhaps is the debate over whether courts, as a matter of policy, should decide contracts cases primarily according to their business expediency (Kronman, 1980), or primarily according to their fairness (Dworkin, 1980). The sale of an end-user good at a discounted price under a contract that excludes warranty protection is conceivably efficient in promoting sales at discounted prices; however, it may be unfair to the purchaser who buys a defective good without warranty protection.

The Judicial 'Management' of Common Law Contracts

A particular concern for courts is in not interpreting contract terms too restrictively on the one hand, or constructing them too liberally on the other. As discussed in Section Freedom to and Freedom from Contracts, common law courts may use an objective test restrictively to determine the intention of contracting parties based on the literal meaning the court ascribes to the actual contractual language, such as the actual words contained in an employment or tenancy contract. A court that adopts a more liberal view may examine the context surrounding the contract as a whole, including the practices or habits of parties to particular kinds of employment or tenancy contracts and the laws, customs, and usages that govern them. An even more liberal judicial approach is to construct contract terms in employment and tenancy contracts according to standards of reasonableness that are based on judicial conceptions of equity that transcend both the literal text and, arguably, the practices and usages of the parties to such contracts (Devlin, 1951).

However, the liberal construction of contract terms is not altogether novel in common law jurisprudence. Courts have long used an objective test to establish the meaning of contract terms within the 'four corners' of the contract. Typically, they have implied terms into contracts that supersede the express terms of the contract (Costigan, 1920). These expansive methods of constructing contract terms are less controversial when courts imply terms mandated by statute, such as implied warranties of fitness under Sale of Goods legislation. Courts act somewhat more controversially when they imply terms into contracts based on their own conceptions of fairness, as distinct from standards prescribed by legislation, which expressly empower courts to imply such terms by operation of law (Farnsworth, 1968).

Such judicial management of contracts has led to disquiet over the perceived risk of courts overmanaging contracts and operating outside the boundaries of reasonable judicial interpretation. A principled criticism of such practices is that the 'bargain' should be determined, first and foremost, by the contracting parties themselves. Judges should neither 'make' nor 'remake' contracts. Nor should they imply terms into contracts based on amorphous and multifarious judicial conceptions of fairness or commercial expediency (Trakman, 1983). They should rather interpret contracts textually in order to regulate contracts efficiently (Schwartz and Scott, 2003).

A countervailing argument is that courts should manage contracts liberally precisely in order to preserve the freedom of the parties to contract, to ensure that parties freely and voluntarily consent to contract, and to prevent parties from being induced or deceived into contracting. It is arguable that courts should adopt such a liberal approach in construing, or even constructing, contract terms in their delivery of justice to the parties, that their resort to principles of equity and norms of social policy is not only appropriate but also necessary. Imputing fair terms into employment contracts is to ensure equitable treatment of employee, not only as a private matter between employer and employee but also as a social policy directed at the reasonable protection of employees in the workplace.

The prospect of judges diverging over the literal or liberal interpretation of contract terms in managing contracts is unavoidable in a common law system in which judges conceive of unfair surprise between contracting parties differently and adhere to disparate notions of social justice. It is also simplistic to insist that the late nineteenth and early twentieth centuries heralded the 'rise' of freedom of common law contracts while the period since then has given rise to the 'fall' of that freedom (Atiyah, 1979). Indeed, there are abundant illustrations of courts in the twenty-first century declining to construe

contracts liberally on diffuse grounds, including in order not to overextend their judicial mandate, and to not unjustifiably interfere with 'private' bargains.

A cautious compromise between freedom to and freedom from contract is for common law courts to maintain that they should manage contracts on predetermined principled grounds only. For example, they should reconcile the freedom to and the freedom from contract only when doing so complies with principled conceptions of consent in contracting. For example, courts should rescind a contract for misrepresentation in finding material evidence of a 'vice' or 'defect' in consent. Similarly, a court should render a contract unenforceable for frustration on principled grounds that the nonperforming party did not reasonably foresee and was not reasonably able to avert or mitigate the frustrating event. In each case, the court's power to manage the contract is restricted by the requirement that it apply the law of misrepresentation or frustration to contracts in a principled and not an arbitrary manner.

A critical response to this supposedly principled judicial approach toward contract construction is that courts do not arrive at the 'true' objective meaning of the contract. They reach neoliberal results out of neoliberal principles of contract law that are devised by empowered classes to perpetuate their privileges. In effect, the interacting principles of freedom to and freedom from contract idealize individual autonomy that empower wealthy white men who historically devised the liberal foundations of modern contract law and who have used contract law to perpetuate their dominance over working classes, ethnic minorities, and women (Dalton, 1985; Kennedy, 1982; Unger, 1986). Alternatively phrased, principles of law that are rationalized according to liberal conceptions of consent are more truly irrational according to any other measure of consent (Singer, 1984).

The tension between liberal and critical conceptions of the common law of contracts is likely to be played out on ever new judicial playing fields, not least of all in cyberspace. A sobering response is that, however innovative cyberspace may be technologically, the Internet has not changed the substance of contractual practice, only its form. However seemingly complex online e-consumer sales contracts may be, the fact is that incomprehensible fine print existed in consumer markets long before contracting in cyberspace was conceived. A welfare view is that legislatures and common law courts should energetically manage e-consumer markets to redress the opportunistic behavior of e-sellers that induce and deceive e-consumer end users into ill-advised e-contracts. A postwelfare – or neoliberal – view is that e-consumers should look after their own contractual interests, not expect legislatures and courts to do so for them. After all, e-consumers are better educated and informed than were traditional consumers. They also have access to the Internet, along with consumer blogs and Web sites, to assist them in reaching informed e-purchasing decisions.

Conclusion

It is too early to declare a victory for proponents of cautious, tempered, or aggressive legislative or judicial management of common law contracts. What is evident is that law makers in common law jurisdictions struggle to agree on why, how, and when to regulate e-markets. This struggle is demonstrated by the unwillingness of the vast majority of American states to enact the Uniform Computer Information Transactions Act developed by Uniform Law Commissioners to regulate e-markets. What is also apparent is that common law courts lack the capacity to regulate divergent e-sales contracts in a systematic and sustained manner (Trakman, 2011).

A salutary conclusion is not to expect common law courts to provide right or wrong answers in regulating often complex contractual practices. The common law is not a pure science. Nor are judges physicists. However principled common law courts purport to be, their decisions are not scientific truths. Nor should they be so conceived, in fact or in law.

Control Behavior: Psychological Perspectives

Jutta Heckhausen, University of California, Irvine, CA, USA

© 2015 Elsevier Ltd. All rights reserved.
This article is a revision of the previous edition article by J. Heckhausen, volume 4, pp. 2719–2724, © 2001, Elsevier Ltd.

Abstract

The scope of control-related phenomena is extensive. Control behavior should be distinguished from perceptions or beliefs about control. The evolutionary origin of control-related behavior is the universal strive to achieve outcomes in the environment by one's own activity. Human agency unfolds its potential across developmental change throughout the life span. The motivational theory of life span development (MTD) proposes that primary control across the life span indicates a fundamental indicator of adaptive development. Primary control striving is organized into cycles of goal engagement and disengagement utilizing specific control strategies. Goal engagement and disengagement are not adaptive as such, but only when congruent with control opportunities given in the concurrent social and developmental ecology.

Psychological Perspectives on Control Behavior

The scope of control-related phenomena is extensive. It encompasses numerous concepts such as perceived control, personal control, cognitive control, vicarious control, illusory control, proxy control, outcome control, primary and secondary control, decisional control, and predictive control (Skinner, 1996). In her review of a decade of control-related research, Skinner (1996) identified some 100 different control-related constructs and cautioned that "the large number of terms has produced some theoretical confusion about the boundaries of the topic of control, about the interrelationships among constructs, and even about which constructs can be appropriately included in the study of control" (Skinner, 1996: p. 550). In order to avoid the widespread conceptual confusion, I begin with a set of definitions for the major control constructs are given. *Control-related behavior* is directed at producing contingencies between own behavior and events. When the events targeted are located in the outside world, the control-related behavior is *primary control behavior*. In contrast, when internal events are targeted it is *secondary control behavior*. *Control* is realized contingency between behavior and event. *Perceived control*, by contrast, refers to the extent to which an individual believes to control behavior-event contingencies. It thus becomes clear that perceived control does not reflect behavior, but internal representations, and may thus be involved in secondary control.

A Functional Analysis of Human Control Behavior: Evolutionary Origin and Human Characteristics of Control Behavior

A common characteristic of all motivated behavior is that the organism attempts to achieve outcomes in the environment by its own activity. In all activities relevant for survival and procreation, such as foraging, attracting a mate, or competing with a rival, the organism strives for control in terms of bringing about desired outcomes and preventing undesired ones. Thus, the most fundamental and universal motivational tendencies relate to this basic strive to control the environment referred to as *primary control striving* (Heckhausen, 2000; Heckhausen and Schulz, 1995). The striving for control is shared with a broad range of species and goes back far into the phylogenetic past; at least as far back as to those species, which first acquired a notable flexibility in their behavior programs (see review in Heckhausen, 2000). This assumption converges with White's (1959) classical article on the motivation for competence, effectance, and mastery as a universal striving of humans and mammals in general.

The fundamental status of control striving in behavior regulation is supported by findings about neonatal behavioral preferences (see review in Heckhausen and Schulz, 1995). Neonatal humans are able to detect behavior-event contingencies, learn head movements to control milk reinforcement, and most importantly, continue to show the control behavior even when after complete satiation, the milk reinforcement has lost its consummatory value and merely provides a contingency event to the infants' head-turning behavior.

Humans hold a unique potential for control in terms of pursuing goals, which can involve multiple subgoals and cover extensive time spans. This capacity is based on the mental representation of goals, which renders the organism independent from immediate external response elicitation and feedback, and sets it free for self-regulation.

Another important characteristic of humans' control-related behavior is their sense of self, and their quest for learning about and feeling good about the characteristics of their own self (e.g., about competence). The sense of self is acquired in early childhood and in itself becomes a motivational incentive for control striving (see review in Heckhausen and Schulz, 1995). Control goals are pursued not only for the sake of their outcomes, and the behavior-event contingency they represent, but also in view of the anticipated enhancement or confirmation of self-ascribed capacities to control outcomes. Mental representations of one's own control capacity and of the control potential inherent in a situational challenge are referred to as *perceived control* (Skinner, 1996).

Particularly for challenging control pursuits, the anticipation of positive information about one's own competence implied in a successful completion of the control striving, becomes a major resource for motivation. Anticipatory positive

self-evaluation motivates the individual to persistently invest effort into acquisitional processes. Only this way can time-extended acquisitional processes of expertise development be sustained motivationally. However, this ability to develop conceptions about one's own competence and control also renders the human motivational system vulnerable to experiences of failure. From about 4 years of age, humans perceive failure as negative feedback about their own competence and react with embarrassment and shame (see Heckhausen and Schulz, 1995). For humans older than 4 years of age, failure may thus undermine self-ascribed competence and perceived control, both important motivational resources needed for persistent primary control striving.

The system of control behavior in humans therefore needs to involve processes that protect and restore conceptions of own competence and mastery. Heckhausen and Schulz in their motivational theory of life span development (formerly "life span theory of control; " Heckhausen and Schulz, 1995; Heckhausen et al., 2010; Schulz and Heckhausen, 1996) have proposed to subsume diverse, mostly cognitive processes, which serve to protect motivational resources and focus them on a given goal (i.e., volitional commitment) of primary control striving, under the construct of *secondary control striving*. Among such secondary control processes are those that help the individual to disengage from a futile goal (e.g., devalue goal, increase value of alternative goals) and protect the self against unfavorable implications of failure and loss (e.g., downward social comparison, egotistic causal attributions). In addition, secondary control strategies are also needed for generating and maintaining motivational commitment to a chosen goal (e.g., enhance value of chosen goal, devalue alternatives, overestimate perceived control for goal attainment; Gollwitzer and Kinney, 1989; Heckhausen, 1999; Wrosch and Heckhausen, 1999).

Motivation and Life Span Development: The Role of Individual Agency

Human ontogenetic potential is vast and that has not just beneficial implications but also gives rise to a need for regulation so that organized and reasonably predictable developmental change and transitions will occur. Regulation can happen via a variety of influencing systems, the biology of maturation and aging, the societal timing of transitions (e.g., school entry, retirement) and canalization of life course paths, and last but not least the individual agent with his/her goals for their own development and life achievements. A motivational approach to life span development focuses on the individual agent who operates in a time-extended action field of their life course. This action field is of course influenced in terms of opening opportunities and setting constraints, by the individual's biological characteristics and by their social context (micro, meso, macro; Bronfenbrenner and Morris, 2006).

Adaptiveness of development can be estimated by determining the degree to which the individual has realized an optimal degree of control in different domains of life across different times of the life span. Criteria for adaptive development should take into account the unique constraints of the individual (e.g., disability), be comprehensive covering multiple important domains of functioning and the grand total of mastery across the individual's life span (Heckhausen et al., 2010).

Most developmental researchers would agree that the individual plays a critical role in shaping their development and life course path (Baltes et al., 1998; Brandtstädter, 2006; Heckhausen, 1999; Lerner and Busch-Rossnagel, 1981). Individual agency has been conceptually and empirically elaborated in action models of developmental regulation, most notably the dual-process model by Brandtstädter and his colleagues (see summary in Brandtstädter, 2006) and the motivational theory of life span development (Heckhausen and Schulz, 1995; Heckhausen et al., 2010; Schulz and Heckhausen, 1996). This article presents the motivational theory of life span development. Discussions about the differences and similarities with the dual-process model can be found elsewhere (Haase et al., 2013; Poulin et al., 2005).

The MTD proposes that the desire to exert control over ones environment and thus realize primary control rules the system of control behavior. MTD elaborates the distinction between primary and secondary control, originally proposed by Rothbaum et al. (1982) and applies it to the human life span. *Primary control striving* is expected to remain the dominant motivator of behavior across the life span, while the potential to realize primary control undergoes radical changes across age (see also Heckhausen, 1999). The capacity for primary control, in contrast, increases during childhood, adolescence, and young adulthood, then reaches a maximum and plateau during midlife, and declines with the loss of social roles and physical fitness associated with old age. The increasing discrepancy between primary control striving and primary control capacity at older ages provides a challenge for the individual, in that it can only be managed by disengagement from age-inappropriate goals and engaging with new more age-adapted goals. Such cycles of goal disengagement and engagement can only be mastered when the individual employs specific strategies addressing the internal world of the individual in terms of goal hierarchies and motivational commitment. Such strategies are conceptualized as 'secondary control strategies.'

Heckhausen and Schulz (1995) and Heckhausen (1999) distinguish between four types of control strategies: *Selective primary control* strategies refer to the investment of internal behavioral resources such as effort, time, and skills in the pursuit of a goal. *Compensatory primary control* is required when internally available behavioral resources of the individual are insufficient to attain the goal, and external resources such as help or advice from others or technical aids (e.g., wheelchair) have to be recruited. *Selective secondary control* serves to enhance and maintain motivational commitment to a chosen action goal, particularly when it is challenged by unexpected obstacles or attractive alternatives. Selective secondary control strategies include enhanced valuation of the chosen goal, and devaluation of nonchosen alternatives, as well as positive illusions about one's control, potential for the chosen goal. *Compensatory secondary control* is required when the individual experiences a loss of control and when the goal becomes unattainable or excessively costly. Compensatory secondary control can be attained by disengaging from the obsolete goal. In addition, compensatory secondary control involves specific self-protective strategies, such as self-protective causal attribution

(avoid self-blame) and downward social comparisons, which deflect the potential negative effects of failure experiences on important motivational resources of affective balance and self-esteem.

The Action-Phase Model of Developmental Regulation

A key proposition of the MTD is that effective developmental agency needs to focus on goals for which the opportunities in the biological and social setting are favorable. Once opportunities fade away (e.g., biological clock for childbearing goal) the individual needs to disengage from the formerly productive but now futile goal and reinvest their motivational and behavioral resources in goals that are more feasible. This is the *principle of congruence* between control opportunities and control striving (Heckhausen et al., 2010).

MTD has integrated models of action regulation, which view goal-directed behavior as organized in action cycles of phases of goal selection, goal engagement, and goal deactivation and reevaluation (Gollwitzer et al., 1990; Heckhausen, 1991). Specifically, the action-phase model of developmental regulation in MTD is shown in **Figure 1**. The action cycle comprises the phases of choosing a goal, engaging motivationally and behaviorally with it, encountering depleted opportunities for goal attainment (developmental deadline), and disengaging from the goal when it is no longer attainable.

During the first phase of optimized goal choice, individuals should use three general heuristics. First, they chose goals that are *congruent* with their control capacity and that varies greatly across age. Second, they select those goals that minimize unfavorable, and maximize favorable, *consequences for other domains* of functioning. And third, individuals try to maintain some *cross-goal diversity* in their goal pursuits to maintain developmental options in case of failure. Once the individual has made a decision about which goal to pursue and thus crossed the decisional Rubicon (see Heckhausen, 1991; also Achtziger and Gollwitzer, 2010), he/she moves into the phase of goal engagement. An important aspect of this phase is that perceptions and information processing become biased toward the goal being pursued. For example, when women are engaged with the goal of bearing a child, their information processing (e.g., what they recall in an incidental memory task) is attuned to child-relevant topics (Heckhausen et al., 2001). For many goal pursuits the opportunities vary over time and across the life span, and can be characterized by an inverted U-shaped trajectory of age-graded changes from steep increase during childhood and adolescence to peak in midlife and decrease in old age. As opportunities (e.g., for childbearing, a final career advancement) fade away, the pursuit of these goals becomes increasingly urgent and thus individuals experience an urgency to intensify their goal engagement. Finally, once the opportunities for goal attainment have slipped away to a degree that makes further pursuit futile (i.e., developmental deadline), individuals need to switch from goal engagement to goal disengagement.

An important proposition of the action-phase model is that the shifts from goal choice to goal engagement and from goal engagement to goal disengagement are conceptualized as discrete and radical, not gradual or continuous. Behavior and thoughts should not oscillate between engagement and disengagement, but be coordinated with regard to the given function of the action phase (either goal choice, goal engagement, or goal disengagement). This idea of radical and discrete switching between action phases has not yet been addressed in empirical research, but is a promising area for future investigation in many domains of functioning, including education, career achievement, and managing health problems.

Note that there is considerable variability in individuals' ability to negotiate important life transitions. As a consequence, different individuals attain different long-term outcomes of developmental regulation, both subjectively and objectively (Heckhausen et al., 2010). Those who have major difficulties with choosing appropriate goals, engaging in attainable goals, or disengaging from unattainable goals waste their control efforts and deplete their resources for future primary control striving. On the other hand, those individuals who manage these transitions in accordance with their capacity

Figure 1 Action-phase model of developmental regulation. Adapted from Heckhausen, J., 1999. Developmental Regulation in Adulthood: Age-normative and Sociostructural Constraints as Adaptive Challenges. Cambridge University Press, New York.

for control maximize their developmental potential and the likelihood of successful life span development.

Developmental Regulation Around Developmental Deadlines

One way to study the responsiveness of control behavior to different control potential is to study developmental regulation across distinct life course transitions in control potential (Heckhausen, 1999). Developmental regulation across the life span is organized along a timetable of waxing and waning opportunities to attain important developmental goals, such as graduating from school, building a career, finding a permanent partner, and having a child. The age-graded opportunity structures for various developmental goals involve final time constraints, conceptualized as developmental deadlines.

An example is the so-called 'biological clock' for childbearing (Heckhausen et al., 2001). Developmental deadlines were shown to be the watersheds between urgent predeadline goal engagement and postdeadline goal disengagement and self-protection (Wrosch and Heckhausen, 1999). Individuals approaching a developmental deadline, such as the early 40s in the case of childbearing, activated goal engagement strategies of control (i.e., selective primary, selective secondary, compensatory primary control) fervently striving to attain the goal before the time runs out. In contrast, once a deadline has been passed (e.g., women in their early 40s or 50s with regard to childbearing), control strategies of goal disengagement, such as devaluing the goal and self-protective downward comparison with others were preferred. Moreover, it was shown that the employment of phase-congruent control strategies (i.e., goal engagement in the predeadline phase and goal disengagement in the postdeadline phase) was associated with greater psychological well-being and mental health (e.g., less depressive symptoms, more positive affect) than phase-incongruent control strategies. In addition, effects of congruence in goal engagement and disengagement were also found for nonintentional biases in information processing. Postdeadline women who recalled items pertaining in topic to childrearing and childbearing reported enhanced negative affect.

Another deadline-related study addressed the congruence of partnership-related goal engagement and disengagement of recently separated young or late-middle-aged men and women with census-based estimates of their remarriage probability (Wrosch and Heckhausen, 1999). Younger adults suffered a deterioration of positive affect if they disengaged from partnership goals after a separation, whereas adults in their 50s benefitted from such disengagement.

The deadline idea was extended to the area of health management. Here the notion is that certain health problems are controllable while others are not and individuals should adapt their goal engagement/disengagement accordingly. In a study of elderly caregivers, health engagement control strategies were associated with decline in depressive symptoms over time, but only for those caregivers who had acute and controllable health problems (Wrosch et al., 2002). Most striking evidence comes from a study of older Canadian adults with serious health problems that were either acute and controllable (post-stroke or post-heart attack rehabilitation) or chronic and uncontrollable (arthritis, heart disease) (Hall et al., 2010). Patients were asked about their most serious health-related restriction in an activity of daily living and whether or not they try to overcome it (goal engagement) or have accepted it (goal disengagement). Goal engagement strategies were associated with greater longevity and better health status for the patients with acute compared to chronic health problems. In contrast, goal disengagement predicted poorer physical health among those who suffered from acute conditions, but better health for those who suffered from chronic conditions.

Goal Adjustment and Goal Engagement in the Transition to Adulthood

In addition to the research addressing the suitability of the action-phase model to reflect the process of goal engagement and disengagement around developmental deadlines and serious health problems, we also investigated processes of goal engagement and managing goal adjustment in the transition to adulthood (e.g., Haase et al., 2008; Heckhausen and Chang, 2009; Heckhausen et al., 2013; Heckhausen and Tomasik, 2002; Shane et al., 2012). The transition to adulthood is a time where more is at stake than at any other time in the life course. This transition decides over whether or not youth maintain or exceed their parents' social status in society or whether they lose status. In societies with much social mobility a lot depends on what the individual youth makes of their opportunities. Different societies, however, may more or less scaffold young people to optimize outcomes in this transition and such scaffolding may pertain to educational paths and/or to paths into vocational careers (Heckhausen, 2002; Heckhausen and Chang, 2009).

We conducted two longitudinal studies of youth's transition to adulthood, one set in the German system of entering vocational training (i.e., applying for apprenticeships after finishing the 10th and final grade of the middle tier of the German school system), and one set in the California multi-tiered college system of transitions after high school graduation. The two systems contrast on the important dimensions of permeability and transparency (Hamilton, 1994). In the German vocational training system (apprenticeship combined with 2 days of school) employers largely rely on school grade information when making decisions about who to hire as an apprentice in more (bank clerk, insurance broker) or less (construction worker) prestigious vocations. The training as an apprentice qualifies for a career in a highly skilled (nonacademic) vocation, but not for entry into college (except via some elaborate educational detour). This means there is high predictability (what does it take to get into certain vocational tracks), but low permeability between vocational and professional career tracks. In contrast, in the United States and particularly in California with its elaborate system of Community Colleges, State universities, and research universities predictability into careers is low, but permeability between jobs, vocational training, college education, and respective careers is high.

We were able to show that in both of these societal contexts the extent of goal engagement was critical for predicting long-term success and well-being (Haase et al., 2008; Heckhausen et al., 2013). In the German study the critical motivational

engagement was with goals of attaining an apprenticeship, whereas in the U.S. context it was an engagement with educational but not with career goals that predicted educational attainment, progress toward career goals, and well-being 4 years after high school graduation (Heckhausen et al., 2013).

However, the adjustment of goals differed in the two contexts. In the more predictable and less permeable context of the German vocational training system, youths closely calibrated their goals in terms of vocational prestige to their relative school grades, and thereby maximized their career prospects while making sure that they did not overshoot in their ambition and ended up empty-handed (Heckhausen and Tomasik, 2002; Tomasik et al., 2009). In contrast, in the less predictable but more permeable California system of higher education, the youth with the highest educational ambitions were most likely to succeed in the long run (4 years after college) (Heckhausen and Chang, 2009).

In sum, research on goal selection and goal engagement in the transition to adulthood shows that goal-focused motivational engagement is essential across different societal conditions (at least in Western industrialized societies). However, different societal conditions (educational and vocational training systems) render different goal adaptations in terms of ambitiousness and calibration more adaptive and this is reflected both in the overall patterns of goal selections and their associations with desired outcomes.

Engagement and Disengagement from Career Goals

MTD was also applied in the domain of adult developmental regulation of career and work trajectories. Using the Midlife in the U.S. study (Shane and Heckhausen, 2013), we found that adults who report high congruence between high control perceptions and high goal engagement regarding one's career goals attain the best developmental outcomes a decade later, both in terms of career outcomes and with regard to subjective well-being. Those adults who report relatively low control over their career prospects yet high engagement with career goals tend to achieve greater career improvements a decade later than those who gave up ambitious career goals. However, they do this at the cost of undermining their long-term primary control striving and their mental and physical health.

A study conducted in the context of post-reunification Germany showed the benefits of disengagement from work-related goals for those who live in regions with extremely impoverished prospects for employment and career progress (Tomasik et al., 2010). Thus, under conditions of severely constrained primary control, giving up even such central goals as finding gainful employment can be adaptive.

Further Research and Future Directions

Further research using the MTD has investigated the implications of opportunity-congruent engagement and particularly disengagement for physical functioning and the physiological stress system (e.g., Wrosch et al., 2009; Wrosch and Schulz, 2008).

Future research about control behavior and developmental regulation using the MTD should investigate the processes involved in goal engagement and disengagement in a micro-sequential manner using experimental paradigms as well as concurrent assessment of affect and physiological indicators such as heart rate, skin conductance, hormonal and brain-activation patterns as correlates of engagement and disengagement phases in the action cycle.

Another important area of future research is the development of individual differences in motivational predispositions for engagement, disengagement, and sensitivity to control opportunities and constraints. In this context, gene–environment interactions need to be explored particularly with regard to sensitive developmental periods in early childhood and adolescence.

Control Beliefs: Health Perspectives

Kenneth A Wallston, Vanderbilt University, Nashville, TN, USA

© 2015 Elsevier Ltd. All rights reserved.

Abstract

This article is about the various ways in which beliefs about control have been defined and operationalized in the context of health. Constructs covered include health locus of control, health self-efficacy (along with related constructs of mastery and competence), perceived behavioral and situational control, and helplessness. The last two sections discuss methods for assessing health control beliefs and altering those beliefs, respectively.

Introduction

Beliefs about control have been related to many aspects of health, including health behavior, health outcomes, and health care. In general, the greater one's sense of control, the more likely one will engage in appropriate behavior and the better one's outcomes. However, the relationship between control beliefs, behavior, and outcomes is not always straightforward. This article covers the following topics: locus of control; self-efficacy, mastery, and competence; perceived behavioral control; perceived situational control; helplessness; assessing control beliefs; and altering control beliefs.

Control refers to the ability to influence what is happening or what will happen. *Beliefs* about control in the context of health refer to the thoughts (or cognitions) that an individual has regarding the ability to influence health behavior, health status (or other health outcomes), or health care. Control beliefs are one of a number of determinants of health behavior and health outcomes. A person's health status can influence and can be influenced by his or her control beliefs. Individuals who believe that they have control over their health behavior are more likely to engage in healthy behavior; thus, they are more likely to have better health outcomes (*see* Health Behaviors). Better health outcomes are associated with more positive control beliefs. Also relevant are beliefs about control over health care delivery. Believing that one can influence one's own health care is a primary determinant of satisfaction with health care. Perceived control over one's health behavior, health outcomes, and/or health care is different from *desire* for control over these aspects. It is assumed that most individuals desire control over their health behavior and health outcomes; no such assumption is made regarding control over how health care is delivered.

Locus of Control

'Locus' refers to the *place* where control (over outcomes) resides – either 'internal' to the individual (i.e., based on his or her own behavior or enduring characteristics) or 'external' to the individual (e.g., due to fate, luck, or chance; other people's behavior; or the influence of God or 'a higher power'). Although it was once thought that *internal* and *external* beliefs were at opposite ends of a continuum (Rotter, 1966), it is now understood that these two belief orientations are independent of one another. That is, a person might simultaneously hold internal and external beliefs about the locus of control of a given phenomenon (e.g., his or her health status; Wallston, 1989, 2001). For example, a person newly diagnosed with lung cancer might attribute the diagnosis to internal factors such as a lifetime of smoking cigarettes in addition to poor dietary and exercise habits. At the same time, the person might attribute the lung cancer to external causes such as 'bad genes' (inherited from one's parents), punishment from God, pollution in the environment, and/or poor luck. Furthermore, one's locus of control orientation about the cause of a health problem (its etiology) is unrelated to one's beliefs about responsibility for the course of the problem (i.e., whether it will get better or worse). It is possible to attribute the etiology of a disease to external causes (e.g., a virus) and to adopt an internal orientation to dealing with the condition once diagnosed (e.g., learn everything one can about the condition and its treatment). Many patients with a medical condition believe that health care professionals either fully or partially control what happens to their health status.

Better health outcomes are typically associated with more internal beliefs about control of one's health. However, an internal health locus of control orientation does not necessarily signify that one attributes only good health outcomes to one's own behavior. For some individuals, having 'internal' beliefs may mean blaming oneself for one's poor health outcomes. Being 'responsible for' one's outcomes does not always translate into being in control of those outcomes. Furthermore, internal beliefs about one's health are only weakly predictive of engaging in healthy behavior or avoiding health risks. Internal beliefs are somewhat more predictive of healthy behavior for people who highly value having good health compared with those for whom good health is less important, but locus of control explains only a relatively small amount of variance in health behavior even for people who highly value good health (Wallston, 1992). Valuing good health and believing that one's health is contingent on one's own actions are necessary, but not sufficient, determinants of health behavior.

Self-Efficacy, Mastery, and Competence

Locus of control is only one type of control belief. Other psychological constructs that are similar to locus of control are *self-efficacy* (Bandura, 1977), *mastery* (Pearlin and Schooler,

1978), and *competence* (White, 1959). Self-efficacy, or the belief that one *can do* a specific behavior in a specific situation, is much more predictive of actually engaging in that behavior in that situation than is an internal locus of control orientation (*see* Self-Efficacy and Health). Both mastery and competence are more generalized constructs than self-efficacy, and they encompass control over the situation and outcomes as well as over behavior. Individuals with a sense of self-efficacy, mastery, or personal competence (and also those with an internal locus of control orientation) generally feel very good about themselves (i.e., have high self-esteem and psychological well-being) and are receptive to learning about and engaging in new behavior. An internal locus of control orientation coupled with a high degree of self-efficacy, mastery, or personal competence is a potent resource for helping individuals cope with health-related stressors.

Perceived Behavioral Control

Ajzen (1988) introduced the construct 'perceived behavioral control' into his theory of planned behavior as a determinant of both behavioral intention and the behavior itself. On a conceptual basis, perceived behavioral control is similar to self-efficacy – both constructs refer to the person's belief that the behavior in question is under his or her control – but, operationally, perceived behavioral control is often assessed by the ease or difficulty of the behavior (e.g., "I find it difficult to exercise three times a week"), while self-efficacy is operationalized by the individual's confidence in being able to carry out the behavior in the face of extenuating circumstances (e.g., "I am confident that I can exercise three times a week even when I am away on vacation").

Like Ajzen's theory of planned behavior, most psychosocial theories of health behavior (e.g., the health belief model (Rosenstock, 1990), protection motivation theory (Prentice-Dunn and Rogers, 1986), and the health action process approach (Schwarzer, 1999)) have incorporated perceived behavioral control as a major determinant of intention to engage in a health behavior, and/or as a determinant of actually engaging in the behavior, but these last three theories explicitly label this construct as 'self-efficacy.' Regardless of the label attached to the construct, believing that one has control over a behavior is highly associated with actually doing that behavior.

Perceived Situational Control

Beliefs about control encompass control over one's situation, as well as control over one's behavior and outcomes. One example of a situation is being a patient in a clinical facility. Does the patient know why he or she is there? Does the patient know what will happen to him or her, and why? What it will feel like? Does the patient have any choice over what will happen? The answers to these questions partially determine the patient's degree of perceived situational control. In turn, the more control the patient believes he or she has in that situation, the less distressed and more satisfied the patient will be, and the more likely the patient will be able to participate in his or her own care, including adhering to situational demands. This is true regardless of how much control the patient wants in that situation (cf Wallston, 1989).

Helplessness

Helplessness is the belief that there is nothing that anyone can do to improve a bad situation (such as being diagnosed with an illness). In many ways, then, helplessness is a belief that control over the situation or its outcomes is impossible. Like all beliefs, helplessness is learned (Seligman, 1975). Learned helplessness is analogous to a chance locus of control orientation (i.e., the belief that one's outcomes are due to fate, luck, or chance). Helplessness beliefs can be either *universal* (i.e., there is nothing that *anyone* can do) or *personal* (i.e., there is nothing that *I* can do). Either type of helplessness belief is associated with motivational, behavioral, and/or affective deficits. People with learned helplessness are not inclined to learn or engage in new, potentially effective behavior, and they exhibit higher-than-normal levels of anxiety and depression.

Assessing Control Beliefs

A number of well-developed, standardized instruments exist for the purpose of assessing individual differences in control beliefs applicable to health and health care settings (Wallston, 1989). Some of these measures, such as the Perceived Health Competence Scale (Smith et al., 1995) are unidimensional. Others, such as the health locus of control scales (Wallston, 2005), are multidimensional and can be adapted to assess control over one's health status in general or control over specified health conditions (e.g., cancer or diabetes). Researchers have also had some success in asking one or two pointed questions about subjects' perceptions of control (see Wallston, 2001, for examples), but the psychometric soundness of this approach is questionable. Measures of desire for control are only weakly correlated with measures of perceived control.

Altering Control Beliefs

Because control beliefs are learned, they can easily change as a function of life events (e.g., receiving a new medical diagnosis), or they can be systematically modified through the application of some form of cognitive behavioral therapy. Shapiro and Astin (1998) developed an integrated approach to psychotherapy, health, and healing that they term 'control therapy.' Unfortunately, that work has stimulated little empirical research by health researchers. However, there has been a great deal of health research having to do with control beliefs based on the theory of self-regulation (cf Boekaerts et al., 2000; Vohs and Baumeister, 2011), and a growing number of investigators are basing their work on control theory, an interdisciplinary branch of engineering and mathematics that deals with the behavior of dynamical systems with inputs (such as beliefs about control over health status).

Abstract

At the beginning of the twentieth century, social control referred to those aspects of social life contributing to the social order, in fact making social order possible. Later, in the writings of sociologists and historians studying prisons, mental institutions, and the like, social control came to mean either a label putting in motion some amplification of deviance process or the organized way in which society reacts to deviance. The term was given a pejorative overtone, meaning coercion, manipulation, and stigmatization. In contemporary criminology, the term is often used in a theory trying to explain juvenile delinquency by a failure of informal controls and to explain the level of crime and violence in neighborhoods. The concept of social control is used by anthropologists to describe the methods by which different cultures resolve conflicts and enforce norms. The social control of crime also refers to all the means specifically aimed at reducing the probability or severity of crime. In the latter case, social control is not so much conceived as the influence of society on individuals, but as the intentional influence by social actors.

An important concept of US sociology at the beginning of the twentieth century, social control referred to those aspects of social life contributing to the social order. It was used to answer a perennial question in sociology: How is it that social order is possible? In the 1970s, a shift in meaning became noticeable. Sociologists and historians studying state institutions designed to deal with deviants, like prisons and mental health facilities, gave it a pejorative connotation: social control came to mean coercion, manipulation, labeling, and stigmatization. At the beginning of the twenty-first century, the term is more often used in criminology than in sociology. Two different meanings can be found. First, in control theories, it means informal social controls imposed on juveniles within the family and the school. Second, it is sometimes used as a synthetic term to include all the actions and institutions intended to curb crime.

The Original Meaning in Sociology

In the eyes of the early sociologists, the question of how society curbs individual passions and interests so as to perpetuate itself in peace was of paramount importance. Social control "referred to the capacity of a society to regulate itself according to desired principles and values" (Janowitz, 1975, p. 82). In 1901, E. Ross published a book called *Social Control. A Survey of the Foundation of Order*, which was influential in putting the concept at the center of US sociology. The question he undertook to answer was: "How is it that people come to live together and cooperate with that degree of harmony we see about us?" A kind of natural order emerges first from people living together with their capacities for sympathy, sociability, sense of justice, and resentment. Second, the society develops a certain measure of control over the individual. The means of control surveyed by Ross (1901) cover a whole range of social practices and institutions: public opinion, law, belief, social suggestion, education, religion, personal ideals, ceremony, art, social valuation, etc. According to Ross, social control includes all those aspects of social life inducing conformity among individuals and contributing naturally to the social order.

Ross shared the preoccupations of Emile Durkheim, who was also trying to discover the roots of social harmony. The French sociologist used the term 'social constraint' to refer to the influence of the 'collective conscience' on individuals. The pressures of society on the individual does not take only the form of external constraints, it also creates a sense of moral obligation to accept duties and to obey the rules (Durkheim, 1960 (1893), 1895, 1923).

Following Ross, sociologists of the Chicago School, like Park, Burgess, and Thomas, continued to place social control at the center of sociology. "All social problems turn out to be problem of social control" (Park and Burgess, 1921, p. 785).

While developing the concept of social control, the early sociologists had another agenda besides explaining social order. They wanted to demonstrate the capacity of sociology to explain social facts more completely than economics or plain common sense. They first wanted to show the limitations of Adam Smith's analysis of the natural harmony of interests fostered by the famous invisible hand of the market. Economic self-interest cannot fully account for the existence of the social order (Pitts, 1968; Janowitz, 1975). They also wanted to debunk the common sense assumption that order resides in the hands of the police, judges, prison guards, and the like. Cooperation, harmony, and organization do not rest predominantly on coercion or on utilitarian calculations but on subtle pressures, expectations, and informal sanctions in the family, in the peer group, the workplace, the local community, etc. However, if social control is neither market regulation nor state control or coercion, one is left with a notion referring essentially to informal social control. But if one sticks to the ambition of taking into account most of the social order, how is it possible to ignore the utilitarian and coercive ways of achieving it?

Another problem emerges: by its very nature, social control is a static concept. When it occupies a central place, sociology becomes the science of social order, unable to analyze social disorder or social change. During the 1920s and 1930s, "sociologists became so caught up with the source of cohesion that

they neglected to examine the source of change" (Rothman, 1983, p. 108).

Those problems cooled the enthusiasm of sociologists for the concept. Some restricted it to the control of deviance. In many contemporary textbooks and handbooks of sociology, one finds a chapter on deviance and social control (e.g., Scull, 1988). After the 1970s, the few sociologists attempting to write on general theory do not make more than a passing mention of the term. The search for the foundation of social order is no longer conceived in terms of the control of society on individuals. A major sociologist like Coleman (1990) explains the social order with the concepts of interdependence, transaction (including exchange, bribes, threats, promises, and resource investment), authority relations, rights, and norms.

The Skeptic Reaction

In the 1960s and 1970s, sociologists critical of the rhetoric and reality of the institutions dealing with deviants (mainly prisons and mental hospitals) gave a whole different tone to the term. Social control came to mean first those stigmatizing actions putting in motion an amplification of the deviance process, and second those bureaucracies pretending to reform and treat deviants but, in fact, indulging in manipulation and coercion.

Labeling

In labeling theory, social control refers mainly to those reactions of police officers, judges, psychiatrists, etc., which consist of arresting, condemning, classifying, and incarcerating. Somebody comes to be classified as criminal, mentally disturbed, dangerous, or deviant in one way or another, and is set apart in a prison, an asylum, or any other place of exclusion. Those reactions mark such individuals, they stigmatize them, and they attach a label to their personality. Doing so, they modify not only the social identity of the individuals but also their self-perception, their way of life, and their behavior. "The experience of being caught and publicly labeled as a deviant … has important consequences for one's further social participation and self-image" (Becker, 1963, p. 31). "Treating a person as though he were generally rather than specifically deviant produces a self-fulfilling prophecy. It sets in motion several mechanisms which conspire to shape the person in the image people have of him" (Becker, 1963, p. 34). Instead of producing order, the attempt at social control amplifies the deviant tendencies of the labeled person (Wilkins, 1964). The arrest, the sentence, the psychiatric diagnostic, the imprisonment, or the institutionalization in a mental hospital puts individuals subjected to one of those treatments at risk of internalizing the infamous label while putting them at the margin of society. They might feel obliged to become part of a deviant group and act as one of the gang. Accordingly, they might become more deviant after being labeled than before.

The labeling theory has been criticized mainly on two counts. The labeling process is not totally arbitrary or completely unrelated to the preexisting deviant behavior and characteristics of the labeled individual. More often than not, the court condemns accused people who really committed a crime, and generally, the more serious the crime, the more severe the sentence. The number of crimes committed in the past by an individual is also related to the severity of the punishment. If such is the case, the question to be asked is: Does the label create a new social identity or is it just a disclosure of a deviant identity already there?

Empirical tests of the labeling hypothesis provide an inconsistent picture, with some researchers finding a weak effect of social reaction on subsequent offending, others failing to find one. The overall impact is small. "The preponderance of research finds no or very weak evidence of labeling effects. The more carefully the research keeps other factors constant, the less likely it is to find evidence that labeling has significant effect on criminal or deviant behavior" (Akers, 1994, p. 134, see also Braithwaite, 1989).

The History and Sociology of State Dealing with Deviants

A related trend of research focuses not so much on the effects of social control but on the characteristics and evolution of state institutions dealing with offenders, mental patients, and other deviants. In this context, social control is defined as "the organized ways in which society responds to behavior and people it regards as deviant, problematic … or undesirable" (Cohen, 1985, p. 1). As with the labeling theory, the concept carries strong pejorative overtones. Gone are the benevolent informal controls to be replaced by coercion, the repressive state, and the manipulation used by the powerful against the lower classes. The negative overtones come also from a disenchantment with the rehabilitative ideal and from skepticism concerning the so-called reform movement with its self-serving ideologies (Rothman, 1983). The historians and sociologists working in this perspective embark upon a work of demystification, confronting the official discourses with the real functioning of the social control apparatus. Psychiatrists and correctional officials pretend to treat and rehabilitate; in fact, they cannot help but keep on putting mental patients in total institutions and incarcerating offenders. Reformers speak of decarceration, decriminalization, and diversion, but in fact the old prison system remains, more crimes are created by the law, and new deviants are caught in the social control net. "Overall, the system enlarges itself and becomes more intrusive, subjecting more and newer groups of deviants to the power of the state and increasing the intensity of control directed at former deviants" (Cohen, 1985, p. 38).

This discrepancy between discourse and reality, between what officials say they do and what they do in fact, is an enlightening exercise provided that it goes beyond plain conspiracy theory.

The main contribution of authors working in this perspective is in the history of changes in punishment in Europe and the United States beginning at the end of the eighteenth century. Foucault (1975) and Ignatieff (1978, 1983) documented the following trends: (1) a sharp decline in physical punishments inflicted in public in order to inspire terror in the spectators, (2) the emergence of the prison as the dominant punishment for serious crimes, and (3) the creation of the

penitentiary, an institution pretending to reform, deter, and isolate prisoners not only from the outside world but also from the criminogenic influence of their fellow prisoners.

In a related vein are sociological studies of the internal functioning of mental hospitals and prisons, like *Asylum* by Goffman (1961). The thesis of the book is that institutions like prisons, mental hospitals, concentration camps, and even monasteries share some basic characteristics. They are all total institutions in which guards, nurses, doctors, etc. are given the mission and the power to control the inmates and isolate them from the outside world. In those total institutions, the dominating group organizes everyday life in minute details for maximizing their control over inmates. They impose detailed regulations so as to make the inmate's behavior most predictable. Swift punishment and degrading measures are visited upon the rebellious.

Social Control in Criminology

Nowadays, it is mostly in criminology that the term social control is found. It is often used in the same skeptical spirit in which the term was used by sociologists criticizing the state's apparatus of control. Some criminologists, however, remain faithful to the orientation of the early sociologists preoccupied with the foundation of social order. One aspect of this social order, which, for obvious reasons, is the focus of criminologists, is a society having a tolerable level of crime. Accordingly, social control is conceived as the means to achieve it.

Control Theory

Instead of asking the usual question, 'Why do people commit crimes?' criminologists who developed the control theory turned the problem around and asked 'Why do people obey the rules of society?' "Deviance is taken for granted; conformity must be explained" (Hirschi, 1969, p. 10). Basically, this is the kind of questioning that was at the center of the works of Hobbes, Durkheim, and Ross.

Control theory was mostly used to explain juvenile delinquency or, more precisely, its absence. Such was the intention of Reiss (1951). He was able to show that delinquency is a result of "a failure of personal and social control." Of interest is his definition of social control: "the ability of social groups to make norms or rules effective."

It is Hirschi's (1969) formulation of control theory that is the most influential in criminology. His basic proposition is that "delinquent acts result when an individual's bond to society is weak or broken" (p. 16). For adolescents, the bond materializes in the family, at school, and with their peers. This bond is made of four elements: attachment, commitment, involvement, and belief. Attachment means the close emotional ties to parents, school teachers, and peers, and caring about their expectations. Commitment is the investment in conformity, in education, and in a future career that would be jeopardized by violating the law. Involvement is the time spent in legitimate activities, like studying, taking part in sports, or leisure activities in the family. Belief refers to the adhesion to the rules of society, to the conventional values, to the idea that law has a moral value and should be obeyed. Hirschi provided the measures for those elements of the bond and a persuasive demonstration that the stronger young people's ties to society (in fact, the family and the school) are, the fewer delinquent acts they report.

Later research found many confirmations of the theory, especially with the attachment and involvement constructs. It is beyond contest that juveniles attached to their family and school do not tend to indulge in delinquency. Also, strong involvement, measured by educational and occupational aspirations, is related to a low level of delinquency (Akers, 1994; pp. 116–20, Braithwaite, 1989; pp. 28–9).

Collective Efficacy and Social Control

In *Neighborhoods and Violent Crime: A Multilevel Study of Collective Efficacy*, Sampson et al., (1997; see also Sampson, 2012) place social control at the center of a major research study that examines 343 neighborhoods in Chicago. Their main hypothesis is that the differential ability of neighborhoods to maintain social control, cohesion, and trust is a major source of neighborhood variation in violence, including homicide. The construct 'collective efficacy' includes two elements: the social cohesion among neighbors and their willingness to intervene on behalf of the common good. By social control, the authors refer to the capacity of a group to regulate its members according to their goals, a primary goal being the desire of residents to live in environments that are free of crime, especially violence. Informal social control is hypothesized to be closely related to social cohesion and trust. These concepts were measured in a survey distributed to neighborhood residents. To measure informal social control, residents were asked about the likelihood that their neighbors could be counted on to intervene in a variety of contexts including if children were spray-painting graffiti on a local building, if they were showing disrespect to an adult, if a fight broke out in front of their house, etc. To grasp social cohesion and trust, respondents were asked how strongly they agreed that 'people around here are willing to help their neighbours,' 'this is a close-knit neighborhood,' 'people in this neighborhood can be trusted,' etc. The results of a sophisticated analysis show that the combined measure of informal social control, cohesion, and trust is a robust predictor of lower rates of violence. Three other dimensions are also relevant: concentrated disadvantage, immigration concentration, and residential stability. These dimensions explain a high percentage of collective efficacy and that their association with violence is largely mediated by collective efficacy.

Cultural Anthropology

The concept of social control is widely used by anthropologists to describe the methods by which different cultures resolve conflicts and enforce norms. The *Oceania* volume of the *Encyclopedia of World Cultures*, published by Human Relation Area Files (Hays ed. 1991), provides information on the social organization and culture of approximately 100 different societies, prior to their being submitted to the influence of the

'white man.' For each culture, one finds an entry about social control defined as "The sources of conflict within the culture and informal and formal social control mechanisms" (p. XX). The following classification of social controls in archaic societies in *Oceania* relies on a compilation of what is written about social control in all cultures where sufficient information is provided.

1. "Gossip": talk, discussion, public opinion, approval and disapproval, shaming, ridicule, mocking, public scolding, ostracism (53 occurrences).
2. "Big-men": chiefs or senior members of a clan have the authority to arbitrate conflicts; some can order confiscation, restitution, fine, flogging, beating, banishment, execution (52 occurrences).
3. "Sorcery": threats and fear of witchcraft, accusations of using sorcery to bring sickness or death, ostracism, assassination, or execution of suspects of sorcery (52 occurrences).
4. "Self-help": physical retaliation by the offended party, revenges, fights, duels, blood feuds (42 occurrences).
5. "Moots": assemblies, ceremonial meetings, feasts aimed at conflict resolution: discussion, negotiation, apologies, compensation, and mediation (29 occurrences).
6. "Taboo": fear of divine retribution by spirits, ancestors, and ghosts (24 occurrences).
7. "Reciprocity": in case of nonreciprocity in an exchange, the aggrieved party withdraws cooperation or demands compensation (14 occurrences).

This list provides a framework of the diversity of sanctions, natural and supernatural, and the degree of severity that exists in different cultures. It also demonstrates the importance of informal social control and the role of third parties. Finally, it illustrates that what is social control from one point of view may be perceived as a crime from another, a point stressed by Black (1983).

Black: Controlling to Right a Wrong

In *The Social Structure of Right and Wrong*, Donald Black (1993; see also Black, 1976; 1984) defines social control as "any process by which people define and respond to deviant behaviour." This definition includes law, arrest by police, lawsuit, punishment, compensation, and intervention in conflict by third parties. Black insists that social control should be conceived as a dependent variable to be explained and predicted by the characteristics of the setting in which it exists. The social stratification and the other dimensions of the social organization are important to explain and predict many manifestations of social control. Paradoxically, crime itself can be and in fact is social control, as exemplified by vengeance. Black distinguishes four styles of social control: compensatory, penal, therapeutic, and conciliatory. Conflict management is a major element in the social control of violence and takes on five forms: self-help (including vengeance, discipline, and rebellion), avoidance, negotiation, settlement, and toleration.

Often, third parties intervene in conflicts. Sometimes, they play support roles, including advisor, advocate, and ally. More importantly, these third parties may act as peacemakers and mediators, who refuse to take sides and seek a solution, typically through compromise. The arbitrators provide opinions, often designating who is right and wrong. The judge has the power to impose and enforce his decision. The importance of third parties for understanding violence, including homicide, lies in the fact that, in some social contexts, third parties take sides and encourage the fighters, which may contribute to the escalation of violence. In contrast, in other contexts, third parties strive to end the conflict and work to restore peace. In principle, the homicide rates should be low in societies where third parties have a tendency to act as peacemakers.

The Social Control of Crime and Rational Choice Theory

The scientific evaluation of the effectiveness of social controls is becoming an important field of research. The revival of deterrence research is a case in point. In its classic formulation, the deterrence hypothesis predicts that the frequency of crime will vary inversely with the certainty, celerity, and severity of punishment handed by the state. Recent researchers cannot find much deterrent effect of severity on crime, but crime rates tend to be low when the certainty of punishment (often measured by the police clearance rate) is high. It is also the case that there is much more evidence of a general effect of certainty on crime rate (general deterrence) than on the level of recidivism of punished offenders (specific deterrence) (Andenaes, 1974; Gibbs, 1975; Blumstein et al., 1978; Cook, 1980; Nagin, 1998; Apel and Nagin, 2011).

However, there are other ways to limit crime than deterrence and informal controls. The state uses nonpunitive ways to keep crime at bay, like therapies to rehabilitate or reform offenders and crime prevention measures such as street lighting, surveillance of public areas, gun control, and regulations on car antitheft systems. In civil society, crime control activities are very common. Everybody devotes time, money, and effort to protect their goods against theft and to safeguard their person against aggression. People put their money in banks, lock the doors of their houses, avoid dangerous places; in some cases, they even buy guns for self-protection. Businesses and other organizations spend considerable amounts of money to protect their assets from loss or crime: they hire private guards, control access to their premises, use safes, install closed-circuit television, etc. All those actions and precautions – public and private, formal and informal, repressive and preventive – are clearly aimed at reducing the probability of a crime occurring. As such, their common goal is crime control. This leads us to a last definition: the social control of crime refers to all the means specifically aimed at reducing the probability or severity of crime.

The reader will note that social control is now defined by its intention or aim, not by its results. By doing this, one follows Gibbs (1989, pp. 23–24) who criticizes the sociological concept for belittling the intentional quality of social control. In its common use, the term 'control' conveys intention: one tries deliberately to control, to direct, and to influence another. Actions having the unintended effect of preventing crime no doubt exist. For example, Felson (1998) explains the sharp decline in crime rates starting in 1994 in the United States by the coming of a cashless society. People use more credit cards

and the like, so they have less cash in their pockets and their houses. Having less cash to steal, the offenders become less active. In this instance, one should not speak of social control but of an unintended preventive effect of an economic evolution.

Results (more or less crimes) are important matters but should not be included in the definition of social control. Attempts at social control, including failures, are social control. The latter's impact is not a matter of definition but of evaluation. Because of their exclusive focus on scientific evaluation, Sherman et al. (1998, p. 2) chose another path. They define crime prevention not by its intention but by its conse-quences. It is "any practice shown to result in less crime than would occur without the practice."

If social control is made of intentional actions and choices, is it possible to conceive its impact on offenders in terms of actions and choices? The potential offender – that is, the individual having the intention to commit an offence – might choose to do it despite social controls or not to do it because of them. Such an individual is a decision maker acting under the constraints of social control.

The impact one tries to have on offenders when one attempts to control crime is essentially to (1) increase the effort of committing crime (e.g., by target hardening or gun control), (2) increase the risks (by surveillance, punishment, burglar alarms, and the like), (3) reduce the anticipated rewards of crime (by target removal, identifying property, etc.), and (4) remove excuses used by offenders to minimize the moral opprobrium cast on crime (e.g., by rule setting and public condemnation of crime) (Clarke, 1997). If potential offenders live in a well-ordered society where those impacts are achieved, they will find themselves in a radically different choice situation than in a disorganized society where social controls are erratic. Most of the time they will find committing crime difficult, risky, unrewarding, and reprehensible. If they are minimally rational (Cornish and Clarke, 1986), they will tend to look for noncriminal alternatives. This means that where and when the social controls operate reasonably well, they shape the alternatives of choice for social actors. They close most of the criminal options for all. They attach quite negative utilities (in the economic sense) to the criminal options. To commit crime in such a situation, one needs a fair amount of greed, temerity, disregard for long-term consequences, or plain foolishness.

Logically, the more serious a type of crime is, the more it should be worthwhile controlling. In fact, one finds that guardianship is lax when minor valuables are to be protected and increased when major valuables or life must be protected. Police detectives work harder investigating murders than burglaries. The positive relation between the gravity of crime and the severity of punishment, as well as between the gravity of crime and the certainty of punishment are basic facts of research on penal decision making (Gottfredson and Gottfredson, 1980). This heightened pressure of social controls on the most serious crimes will give incentive to offenders to choose the least criminal option, the least severe offense in the eventuality that they persist in crime. That should explain the inverse relation one finds between the frequency of a type of crime and its severity (there are fewer murders than robberies, and fewer robberies than burglaries). Those pressures on criminal choices can be called the structuring effects of social control (Cusson, 1993).

However, the lesson learned by sociologists and historians, showing that social controls often operate in an erratic manner, should not be forgotten. Formal and informal controls are not in place where they should be for a number of reasons: groups are too disorganized, resources are lacking, and acts do not follow the rhetoric. This is to mean that the quality and intensity of social control have every reason to be highly variable in space and time. In turn, this uneven quality and intensity of social control should be related to the uneven distribution of crime rates in space and time.

Abstract

The term 'control' denotes a relation of coreference between one (or occasionally several) nominal constituents in a main clause and the covert subject of a nonfinite subordinate clause, where the former (controller) determines the reference of the latter (controllee). This article traces the history of control theory from English-based syntax-oriented approaches in generative grammar to accounts that acknowledge cross-linguistic differences and the relevance of semantic and discourse-pragmatic factors in control relations.

Introduction

The term 'control' is attributed to the generative linguist Paul Postal (1970). It metaphorically expresses the observation that the reference of an understood grammatical subject in a subordinate clause, the controllee, may depend on the reference of another constituent, the controller, in the main clause. An example illustrating the control relation is given below in (1a), with its relevant syntactic structure represented in (1b). In (1b) constituents with the same reference are marked by identical subscripts; the bracketed part of the sentence contains a nonfinite subordinate clause with an implicit subject symbolized as 'Ø' (for 'empty subject'). These conventions are followed throughout this article.

1. a. Mary convinced Bill to do her homework.
   b. Mary_i convinced Bill_j [$Ø_j$ to do her homework].

In (1), the noun phrase *Bill* controls the reference of the empty subject of the infinitival complement clause. Every native speaker of English will understand (1) as meaning that Bill, and not Mary herself, will do her homework. The challenging linguistic problem is to find a principled account for why in (1) the main clause object is the controller, why the main clause subject cannot have this function, and why the empty subject cannot just refer to a third person not mentioned in the sentence at all.

Sentences such as (1) exhibit the notion of obligatory control, that is, a case in which the empty subject must be coreferential with a main clause constituent. Obligatory control contrasts with free (also called arbitrary or nonobligatory) control as in:

2. [Ø to wait in the crowded airport] would be a mistake.

In the subject clause in (2), the reference of the understood subject is not determined by any other noun phrase in the sentence but depends on the discourse context.

A comprehensive state-of-the art report on control, especially in the framework of generative grammar, has been compiled by Landau (2013).

Some Control Phenomena

In this article, the term 'control' will be understood as meaning 'obligatory control.' The following nonexhaustive list gives some sentences that exemplify obligatory control.

Infinitival Purpose Clauses:

3. John_i bought a book_j [$Ø_i$ to amuse himself with] (adapted from Nishigauchi, 1984, p. 229).
4. Mary_i bought the little boy_j a toy [$Ø_j$ to amuse himself with] (adapted from Nishigauchi, 1984, p. 229).

Infinitival Complement Clauses:

5. John_i begged Mary_j [$Ø_j$ to leave].
6. Mary_i begged [$Ø_i$ to leave].

Gerundial Complement Clauses:

7. Paul_i thanked Mary_j for [$Ø_j$ writing the report].
8. Paul_i thanked Mary_j for [$Ø_i$ having been admitted to the tennis club].

Most work on control has been done on nonfinite complement clauses, that is, on clauses exemplified by sentences (5) through (8). The remainder of the article, therefore, is concerned mostly with control in nonfinite complement clauses.

Types of Control

Control relations can be classified in terms of the kind of coreference that links controller and controllee. Control can be 'exhaustive,' 'partial,' 'variable,' and 'split.' In an exhaustive control relation, controller and controllee 'completely overlap' (Stiebels, 2007, p. 5) or are 'strictly identical' in reference (Landau, 2010, p. 364). The following examples from the Corpus of Contemporary American English (COCA: Davies, 2008–) illustrate this property:

9. Obama_i has managed [$Ø_i$ to use effective diplomacy to enhance American influence] (COCA, 2012: Davies, 2008–).
10. […] President Obama_i promised [$Ø_i$ to cut the deficit in half […]] (COCA, 2012: Davies, 2008–).

In (9) and (10) the controllers *Obama* and *President Obama*, respectively, are strictly identical to the denotatum of the covert subject in the complement clause.

A controller may also determine only a subset of the possible referents of the controllee. This phenomenon, exemplified by (11), is called 'partial control' (see Hornstein, 2003; Landau, 2000; Stiebels, 2007 for more examples).

11. She$_i$ preferred [Ø$_{i+}$ to meet in person […]] (COCA, 2012: Davies, 2008–).

The interpretation of (11) depends crucially on the meaning of *meet*, which requires at least two participants. The subscript 'i+' in (11) – a notation borrowed from Hornstein (2003) – symbolizes reference to at least one additional participant. This plurality interpretation follows from the semantics of *meet*. The additional referent (or referents) has no overt antecedent in the main clause of (11). In contrast to mental state verbs like *prefer* and *want*, implicative verbs like *manage* and *force* do not allow partial control. For example, the following contrasts can be observed (see also Landau, 2000; Hornstein, 2003; Stiebels, 2007):

12. After about 3 h, all our guests$_i$ managed [Ø$_i$ to gather in the apartment, tired and starving] (COCA, 2010: Davies, 2008–).
13. *The chair$_i$ managed [Ø$_i$ to meet/gather at 6] (adapted from Hornstein, 2003, p. 37).
14. The chair$_i$ preferred [Ø$_{i+}$ to meet/gather at 6] (adapted from Hornstein, 2003, p. 37).

Sentence (12) is well formed since the empty subject in the infinitival clause is exhaustively controlled by the matrix subject. The set of guests is strictly identical to the set of people that gather in the apartment. In contrast, in (13) the singularity of *the chair* clashes with the plurality of participants entailed by the meanings of *meet* and *gather*, respectively. Finally, sentence (14) is fully acceptable because the verb *prefer* allows partial control and is, therefore, compatible with the singular controller *the chair* despite the plurality of referents evoked in the complement clause.

Variable control can be illustrated with the following German example (adopted from Stiebels, 2007, p. 3):

15. Maria$_i$ schlug Peter$_j$ vor [Ø$_{i/j/i+j}$ einen Tisch im Restaurant zu reservieren]. "Maria suggested to Peter that she/he/she and he reserve a table in the restaurant."

The German verb *vorschlagen* 'suggest, propose' allows control by the matrix subject, the matrix object, and even split control (see next paragraph), that is, the interpretation that the referents of the subject and the object in (15) reserve a table. In addition to the variable control reading, a partial control reading is also possible: a third person not explicitly identified in the main clause could also undertake the action expressed in the complement clause.

Split control typically occurs in the case of agreements about joint or collaborative efforts (cf Stiebels, 2007, p. 5).

16. This summer, Fiat$_i$ agreed with Mitsubishi$_j$ Ø$_{i+j}$ to develop a sport utility vehicle for sale in Europe (COCA, 1999: Davies, 2008–).

Sentence (16) conveys that only *Fiat* and *Mitsubishi* cooperate in developing a new sport utility vehicle. From a syntactic perspective one can call (16) an example of split control since there is not a unique controller, but a division of labor between two controllers (subject and prepositional complement). From a semantic–pragmatic point of view, one could also speak of 'joint control' because both controllers are collaboratively involved in the task specified in the complement clause.

A Short History of Control

In the 1960s and 1970s, the early days of generative grammar, control was generally believed to be a purely a syntactic phenomenon. More recently, it has become increasingly evident that semantic and pragmatic factors play an equally, if not more important role in control.

Syntactic Approaches

The syntactic approach to control assumes that control relations can be determined on a purely structural basis. The most influential proposal along these lines was made by Rosenbaum (1967, 1970). He postulates a Minimal Distance Principle (MDP), which predicts that the reference of the (empty) subject of a nonfinite complement clause depends on the closest available controller in the main clause. In sentence (1) above, the main clause noun phrase closest to the empty subject Ø is *Bill*. Indeed, this noun phrase controls the reference of the empty subject, and the MDP thus makes the right prediction. Hornstein (1999) assumes a Minimal Link Condition to account for the same facts. The Minimal Link Condition, as formulated within the minimalist framework of generative grammar, stipulates a preference for minimal derivations.

There are, however, many sentences for which a minimality condition such as the MDP is falsified. Difficulties emerge with constructions that display more than one potential controller in the main clause, as in (17) and (18):

17. Mary$_i$ persuaded Bill$_j$ [Ø$_j$ to clear her$_i$ desk].
18. Mary$_i$ promised Bill$_j$ [Ø$_i$ to clear her$_i$ desk].

For sentence (17) the MDP correctly selects the closest noun phrase in the main clause, *Bill*, as controller. *Persuade* belongs to the class of control verbs that normally select the main clause object as controller. However, for sentence (18) the MDP wrongly predicts *Bill* as controller; in fact, the main clause subject *Mary* is the controller. Subject control verbs of the *promise* class constitute a problem for the MDP and have to be marked as exceptional in the lexicon. In this connection, it is however worth noting that in ordinary language there is a strong tendency to avoid the use of *promise* with a matrix object. Thus, sentence (19) is compatible with the MDP – at least in the sense that the closest explicit argument is selected as controller.

19. Mary$_i$ promised [Ø$_i$ to clear her desk].

Although instances of *promise* with a matrix object are relatively infrequent in English-language corpora, in other languages, for example, German, the corresponding verb *versprechen* often occurs with an overt matrix object and falsifies the Rosenbaum's MDP because *versprechen* like *promise* exhibits subject control in the default case. The main objection to the MDP is, therefore, that it is too language specific, that is, tailored to account for control phenomena in English.

Another fact that challenges the validity of the MDP is that one and the same verb may admit either subject or object control:

20. Bill$_i$ thanked the coach$_j$ for [Ø$_j$ selecting him$_i$].
21. Bill$_i$ thanked the coach$_j$ for [Ø$_i$ having been admitted to the tennis club].

In (20), which can be regarded as the default case, the controller is *the coach* (object control), whereas in (21) a control switch or shift takes place: the most likely controller is the matrix subject *Bill*. The MDP wrongly predicts that in both sentences *the coach* should be the controller.

Other syntactic control theories have been proposed by Bresnan (1982) and by Bach (1979) in the frameworks of Lexical–Functional Grammar and Montague Grammar, respectively. What these theories have in common is that they regard syntactic structure as the decisive factor for determining the control relationship. However, there is a substantial body of evidence that strongly suggests the importance of semantic and pragmatic information in the determination of control relations.

Since the 1980s, two theoretical problems have dominated the discussion about obligatory control into complement clauses. The first of these concerns the syntactic status of the complement clause, more specifically the question whether the empty placeholder PRO (a 'silent' pronoun, symbolized as 'Ø' in this article) is a syntactic constituent, that is, a genuine subject. Generative grammarians have generally been divided between a propositional and a predicational analysis of control. The propositional approach assumes that the complement clause expresses a complete (closed) proposition; hence PRO is believed to be a syntactic – albeit silent – constituent. This position is especially advocated by Chomsky and his followers (see e.g., Chomsky, 1980). In contrast, the predicational theory of control (see e.g., Williams, 1980) holds that nonfinite complement clauses are predicates, that is, open propositions or unsaturated predicates that must be predicated of a nominal referent in the matrix clause (see e.g., Landau, 2004 for a brief description of this controversy and further bibliographical references).

The second theoretical issue concerns the relationship between raising (a constituent out of a subordinate clause into the main clause) and control (see e.g., Hornstein, 2003; Davies and Dubinsky, 2006 for discussion). In classical generative grammar, raising and control have been regarded as distinct syntactic mechanisms:

22. John$_i$ seems/appears/is likely [t$_i$ to like Mary] (adapted from Hornstein, 2003, p. 7).
23. John$_i$ tried/hoped/expected [PRO$_I$ to like Mary] (adapted from Hornstein, 2003, p. 7).

Sentence (22) is traditionally regarded as involving movement of the subject of the embedded clause, *John*, into the subject position of the matrix clause, leaving a trace of the moved constituent (t) in the embedded clause. In contrast, in (23) the covert subject of the embedded clause (PRO) remains *in situ* and is coindexed with the subject of the matrix clause, *John*; in other words, the matrix clause subject controls the reference of the understood subject in the infinitival complement clause (see Hornstein, 2003; Hornstein and Polinsky, 2010 for an in-depth discussion of this issue within the framework of generative grammar).

Semantic Approaches

A comparison of sentences (17) and (18), which look alike structurally, invites the conclusion that their differing control properties are caused by the meanings of the verbs *persuade* and *promise*, respectively. To persuade somebody to do something means that the addressee of an act of persuasion is led to believe that he or she should do something. This prospective action is expressed in the infinitival complement clause. Since in an active sentence such as (9) the addressee is the grammatical object of the main clause, it is not surprising that this constituent functions as controller. In contrast, a promise involves a commitment of the speaker to a future course of action. In an active sentence such as (18), the 'promiser' is the grammatical subject and one would, therefore, expect the subject to control the reference of Ø.

An account that acknowledges the importance of the meaning of control verbs is Sag and Pollard's (1991) control theory formulated within the framework of Head-Driven Phrase Structure Grammar. These authors use semantic criteria to distinguish three classes of control verbs: (1) the *order/permit* class, which typically induces object control; (2) the *promise* class, which typically induces subject control; and (3) the *want/expect* class, which again induces subject control. The *order/permit* and the *promise* classes conceptually imply actions, whereas verbs of the *want/expect* class express what Sag and Pollard call an 'orientation' in their complement clause.

A touchstone for any control theory is the phenomenon of control shift (from subject to object control, and vice versa). Control shift tends to occur in specific syntactic contexts, for example, passivized and modalized complement clauses (especially with *be allowed to*), or complement predicates that are recipient oriented (see Panther and Köpcke, 1993; Panther, 1994; Köpcke and Panther, 2002; Stiebels, 2007). Sag and Pollard (1991), and subsequently Jackendoff and Culicover (2003) and Culicover and Jackendoff (2005), propose that control switch can be explained in terms of a conceptual enrichment of the literal meaning of the complement clause. Consider an example with a passivized complement clause such as (24):

24. Mary$_i$ asked Peter$_j$ [Ø$_i$ to be invited to the party] (Stiebels, 2007, p. 4).

The requestive verb '*ask*' usually induces object control, as in (25):

25. Mary$_i$ asked Peter$_j$ [Ø$_j$ to leave her alone].

However, in (24) the most plausible interpretation is that the matrix subject *Mary* corefers with the understood subject of the complement clause. The meaning of (24) can be paraphrased as (26):

26. Mary asked Peter to bring about the event 'Mary is invited to the party.'

The predicate of the complement clause in (24) has thus been coerced into a causative meaning. The causer that brings about the state of affairs 'Mary is invited to the party' is *Peter*. Stiebels (2007, p. 4) observes that the syntactic controller in (24) is the matrix subject *Mary*, but the semantic controller remains, as required by the semantics of *ask*, the referent of the matrix object.

Pragmatic Approaches

Since the mid-1980s, the insight has grown that, in addition to the meaning of control verbs, the context in which a sentence is

uttered and world knowledge about the participants' status play a significant role in assigning the coreferential links between the controller and the controllee (e.g., Comrie, 1984, 1985; Růžicka, 1999; Duffley, 2014).

These additional pragmatic factors are illustrated by the following German sentences (adapted from Wegener, 1989):

27. Der Anwalt$_i$ versprach dem Häftling$_j$ [Ø$_j$ bald aus dem Gefängnis entlassen zu werden]."The lawyer promised the prisoner that he (=the prisoner) would be released from jail soon."
28. Der Häftling$_i$ versprach seiner Frauj [Ø$_i$ bald aus dem Gefängnis entlassen zu werden]."The prisoner promised his wife that he (=the prisoner) would be released from jail soon."

The most plausible interpretation for both (27) and (28) is that the prisoner will be released from jail. These interpretations follow from the speech act verb *versprechen* 'promise,' the status of the referents of the noun phrases *der Anwalt*, *dem Häftling*, and *seiner Frau*, and the meaning of the passive complement clause. A promise implies a promiser who is committed to a future action and a promisee who benefits from the action of the promiser. This semantic–pragmatic scenario can be applied to the interpretation of sentences (27) and (28) and the most plausible controller can be inferred (cf Panther and Köpcke, 1993; Panther, 1994; Köpcke and Panther, 2002).

In (27) the lawyer is the promiser; hence the lawyer is committed to some future action. However, the complement clause does not express an action explicitly. A step toward a reasonable interpretation is to assume that the complement clause expresses the result of an action performed by the promiser. The action itself has to be inferred. Furthermore, the result of the action is beneficial to the prisoner. Therefore, the most plausible controller is the noun phrase *dem Häftling*. On this account, the assignment of the controller is not a matter of finding the noun phrase that is syntactically closest to Ø in the matrix clause, but a matter of common-sense knowledge about the roles of lawyers and prisoners.

For (28), a coherent interpretation results if it is assumed that the prisoner behaves in such a way that he causes his release from jail. Again, the complement clause is interpreted as the result of an action – an action carried out by the prisoner to the effect that he will be released from prison. His wife can be regarded as the beneficiary of this action. The interpretations sketched above are not the only ones possible. On the assumption that the lawyer is in jail (27) could be interpreted as conveying that the lawyer will be released from jail; and (28) could have the interpretation, 'The prisoner promised his wife that she would be released from jail soon' given the background knowledge that the prisoner's wife is in prison. It is in the nature of the pragmatic approach to control that different background assumptions have an impact on what is the most plausible controller of Ø.

Similar observations have been made for Chinese by Huang (1994, p. 153), who contrasts the following sentences:

29. Xuesheng$_i$ daying laoshi$_j$ [Ø$_i$ mingtian jiao zuowen].
'The pupil promises the teacher that he (=the pupil) will hand in the essay tomorrow.'
30. Laoshi$_i$ daying xuesheng$_j$ [Ø$_j$ mingtian fang yi tian jia].
'The teacher promises the pupil that he (=the pupil) will have a day off tomorrow.'

The control verb *daying* 'promise' can be used either in the 'unmarked,' that is, normal sense 'commitment-to-action,' as in (29), or in the 'marked' sense 'commitment-to-permission,' as in (30). These senses are derived pragmatically; they constitute 'preferred' interpretations that can be inferred on the basis of the meaning of the speech act verb *daying* and world knowledge about teacher–pupil interactions in the institutional framework of a school.

To summarize, the interpretation of control sentences relies not only on syntactic and semantic information but also, to a substantial degree, on world knowledge and contextual clues about the utterance situation.

Language-Specific Coding Differences of Control Relations

One might surmise that the mechanisms of control are very similar across languages, but on closer inspection it turns out that there are language-specific differences in the way that control structures are coded. A selective list of these coding differences is given below (for a detailed account, see Růžicka, 1999).

Modal versus Nonmodal Coding

For many speakers of English the following sentence is ambiguous:

31. Johnny$_i$ asked his mother$_j$ [Ø$_{i/j}$ to go to the movies].

Sentence (31) can mean either that Johnny wants his mother to go to the movies or that Johnny asks for permission to go to the movies himself. This latter interpretation seems to be the most likely one, assuming that Johnny's mother has authority over Johnny (see the section 'Pragmatic Approaches').

As Růžicka (1999, p. 45) points out, the 'ask-for-permission' (subject control) reading is also available alongside the 'ask-for-action' interpretation (object control) in Spanish, although the concept of permission is not coded explicitly.

32. María$_i$ le$_j$ pidió a Juan$_j$ [Ø$_i$ hablar con los muchachos].
'María asked Juan that she be allowed to talk to the boys.'

The 'ask-for-permission' interpretation is not possible, however, if the same sentence is translated literally into German:

33. Hänschen$_i$ bat seine Mutter$_j$ [Ø$_j$ ins Kino zu gehen].
'Johnny asked his mother to go to the movies.'

Sentence (33) can only mean that Hänschen's mother is supposed to go to the movies. In order to express the 'ask-for-permission' sense, with Hänschen as the controller, German speakers have to resort to an utterance that codes permission by means of the modal auxiliary *dürfen*:

34. Hänschen$_i$ bat seine Mutter$_j$ [Ø$_i$ ins Kino gehen zu dürfen].
'Johnny asked his mother to be allowed to go to the movies.'

Causative versus Non-Causative Coding

Another important coding difference between English and languages like German, Russian, and Czech is exemplified by

35. Peter$_i$ persuaded his father$_j$ [Ø$_j$ to be examined by a doctor].

Sentence (35) means that Peter's father should undergo a medical examination. This sense is, however, not explicitly coded in sentence (35), but is nevertheless conventionally conveyed by it. What is coded in the subordinate clause is the result of the action, not the action itself. If sentence (35) is translated literally into German, for many speakers, unacceptability results and, for those who accept the sentence, an interpretation with Peter as controller is more plausible:

36. Peter$_i$ überredete seinen Vater$_j$ [Ø$_i$ von einem Arzt untersucht zu werden].
'Peter persuaded his father that he (=Peter) should be examined by a doctor.'

The only way of rendering the intended message of (35) in German and Russian is to code *seinen Vater* and *otca*, respectively, as an active participant who engages in an action that results in a medical examination by a doctor:

37. Peter$_i$ überredete seinen Vater$_j$ [Ø$_j$ sich von einem Arzt untersuchen zu lassen].
'Peter persuaded his father to have himself (=his father) examined by a doctor.'
38. Peter$_i$ ugovoril otca$_j$ [Ø$_j$ podvergnut' sebja osmotru vrač] (Růžicka, 1999, p. 58).
'Peter persuaded father that he (=father) should undergo a medical examination.'

Both the German and Russian languages have to code the agent role of 'father' explicitly. This is done by the causative verb *lassen* in German and the action verb *podvergnut' sebja* 'submit oneself' in Russian.

Implicit Control versus Explicit Control

Another important difference between English and other languages such as German and Russian concerns the ability for a conceptually present controller to remain unexpressed. In this section the focus is on contrasts between German and English. In German it is possible to say:

39. Der Professor$_i$ bat Ø$_j$ [Ø$_j$ den Zeitschriftenartikel zu kopieren].
'The professor requested (of some person) that this person photocopy the journal article.'

In (39) the controller of the understood subject remains unexpressed. The person or group of persons supposed to comply with the request is indeterminate. This phenomenon may be called implicit control (cf Panther, 1997; Landau, 2010 for more detailed discussion of explicit and implicit control).

However, a word-for-word translation of (39) into English would not have the same effect:

40. The professor$_i$ asked Ø$_j$ [Ø$_i$ to photocopy the journal article].

The only possible interpretation of (40) is that the professor himself wants to photocopy the journal article and asks for permission to do so. In German, however, the translation of (40) requires modal coding with *dürfen* 'be allowed to' (see section 'Modal versus Nonmodal Coding'), as in (41):

41. Der Professor$_i$ bat Ø$_j$ [Ø$_i$ den Zeitschriftenartikel kopieren zu dürfen].
'The professor asked to be allowed to photocopy the journal article.'

The first point to be made is that in English examples like (40) either the control verb *ask* is 'coerced' into reading as 'ask for permission' or, alternatively, that the complement clause predicate *photocopy the journal article* is shifted to the meaning 'be allowed to photocopy the journal article.' Second, since the direct object in the matrix clause is covert, the controller function in (40) is automatically switched to the overtly expressed matrix subject. In contrast, in German the covert matrix object is the obligatory controller in (39). Third, control shift to subject control is possible in German with directive speech act verbs like *bitten* 'ask, request' but requires additional coding in the complement clause (here: *dürfen* 'may, be allowed to').

Another example of implicit control in German is (42):

42. Der Arzt$_i$ riet Ø$_j$ [Ø$_j$ den Fettanteil in meinem Essen zu verringern].
'The doctor advised (someone) that this person should reduce the amount of fat in my diet.'

The literal translation of (42) into English leads to ungrammaticality (marked by an asterisk):

43. *The doctor$_i$ advised Ø$_j$ [Ø$_j$ to reduce the amount of fat in my diet].

Sometimes the ban on implicit object control in English can be circumvented by resorting to a gerund construction. A possible rendering of (42) in English is (44):

44. The doctor$_i$ advised Ø$_j$ [Ø$_j$ reducing the amount of fat in my diet].

There exist a few verbs in English that allow implicit object control. Among them are *signal* and *motion*, exemplified in (42):

45. a. The clerk$_i$ signaled Ø$_j$ [Ø$_j$ to approach the teller].
b. Bill$_i$ motioned Ø$_j$ [Ø$_j$ to come in].

In general, German permits implicit complement control more freely than English. There are however control verbs in both English and German whose matrix object has to be coded explicitly and which, hence, do not license implicit control. These verbs can be characterized as 'manipulative' and comprise some directive illocutionary verbs and implicative verbs. Examples for the subclass of directive speech act verbs are given in (43) and (44). These verbs convey a high degree of imposition and the intensity of their directive force is indicated in dictionaries by manner adverbs such as *earnestly*, *urgently*, *fervently*, *anxiously*, and *desperately*. They include for example, *implore* and *beseech*, and their German counterparts *beknien* 'entreat,' and *beschwören* 'beseech' (see Panther, 1994, 1997; Köpcke and Panther, 2002 for a more detailed analysis):

46. a. Peter$_i$ beschwor Paul$_j$ [Ø$_j$ nicht zu rauchen].
b. Peter$_i$ beseeched Paul$_j$ [Ø$_j$ not to smoke].

c. *Peter$_i$ beschwor Ø$_j$ [Ø$_j$ nicht zu rauchen].
d. *Peter$_i$ beseeched Ø$_j$ [Ø$_j$ not to smoke].

47. a. Hans$_i$ bekniete Maria$_j$ [Ø$_j$ den Computer zu kaufen].
b. Hans$_i$ entreated Maria$_j$ [Ø$_j$ to buy the computer].
c. *Hans$_i$ bekniete Ø$_j$ [Ø$_j$ den Computer zu kaufen].
d. *Hans entreated Ø$_j$ [Ø$_j$ to buy the computer].

The second class of control verbs requiring an explicit object controller comprises verbs that entail the propositional content expressed in the complement clause. Such implicative verbs are for example, *induce* and *force* and their German equivalents *veranlassen* and *zwingen*, respectively, exemplified in (48) and (49):

48. a. Sie$_i$ veranlasste ihn$_j$ [Ø$_j$ ein neues Projekt zu beginnen].
b. She$_i$ induced him$_j$ [Ø$_j$ to start a new project].
c. *Sie$_i$ veranlasste Ø$_j$ [Ø$_j$ ein neues Projekt zu beginnen].
d. *She$_i$ induced Ø$_j$ [Ø$_j$ to start a new project].

49. a. Helga$_i$ zwang Otto$_j$ [Ø$_j$ das Projekt aufzugeben].
b. Helga$_i$ forced Otto$_j$ [Ø$_j$ to abandon the project].
c. *Helga$_i$ zwang Ø$_j$ [Ø$_j$ das Projekt aufzugeben].
d. *Helga forced Ø$_j$ [Ø$_j$ to abandon the project].

In sum, the data in (46)–(49) suggest the following generalization: the more manipulative the meaning of a control verb, the more likely the controller is explicitly coded (Panther, 1997).

Conclusion

Human languages employ various means to track referents on the sentence and discourse levels. Control relations can be seen in this larger context. As with other coreference relations, it turns out that the interpretation of control structures involves a complex interplay of syntactic, semantic, and pragmatic parameters.

Control Theories and Crime

Abstract

Control theories of crime focus on the inhibiting effects of conventional social institutions on criminal behavior. In general, control theories of crime emphasize how strong social ties to institutions, such as one's family (e.g., parents, spouses, and children), peer group, school, church, community, and workplace, among others, are expected to reduce the likelihood of crime by highlighting the negative consequences of criminal acts for those social ties. The cumulative body of contemporary criminological research is largely supportive of the key expectations of control theories of crime.

What Are Control Theories of Crime?

Control theories of crime represent a wide range of explanations that have their roots in the classical school of thought (Britt and Gottfredson, 2003; Roshier, 1989). The fundamental component to any control theory of crime is the expectation that individuals will engage in criminal activity if it is perceived to be in their self-interest. What this means is that it is the responsibility of the society to monitor individuals so that it reduces the chances of crime being perceived as beneficial in some way and the negative consequences are more clearly understood. To be clear, no assumption of rationality is required here – all individuals will recognize the immediate benefits of a wide range of criminal acts, but will differ in their perceptions of the consequences associated with those specific criminal acts. If the consequences do not outweigh the apparent benefits of the criminal act, it is more likely to occur. A flawed or short-term oriented decision-making process is not important for control theory. The theory allows for the likelihood that decisions may be made very quickly, often under the influence of alcohol or drugs. Regardless of how impaired (or not) the decision-making process is, it is still decision-making made by individuals which is reflective of their perceived self-interest at the moment of some act.

The individual-level assumption crucial to all control theories is the idea that individuals are, by nature, self-interested. The ability or degree to which individuals are able to think through the various long- and short-term consequences of all their actions conditions whether the criminal act is perceived to hold some benefit – be it economic, psychological, or social. At the societal level, the assumption critical to control theories is the expectation that society can introduce mechanisms that will either prevent or reduce the chances where an individual will perceive a criminal act as beneficial. As described below, these mechanisms may take a variety of different forms, but all have as the goal the prevention of criminal acts by enhancing the negative consequences of crime. At a much more general level, what makes the intervention of society possible is the functioning of a social order that reflects a broad set of common values and norms. For example, Ruth Kornhauser noted, "Rules governing the use of force and fraud are a prerequisite of group life" (1978, p.250). Social order is sustained by a wide range of social institutions – both formal and informal – that reflects these values and norms.

The combination of assumptions about individual self-interest and social control of behavior leads to the fundamental claim of all control theories: crime is caused by the weak control of individuals. To the extent that individuals are highly controlled, the likelihood of their committing criminal acts should be relatively low. The personal and social costs of being caught are high enough such that individuals would typically not perceive the commission of a crime to be in their self-interest. Alternatively, for individuals who are weakly controlled, the likelihood of crime commission should be considerably higher, since the consequences at either the individual or the social level are perceived as small relative to the pleasure or satisfaction gained from committing some crime.

Sources of Control

Control theories of crime locate the primary cause of crime in the weak control of individuals. What are the sources of control? There are several different dimensions of control, but the following discussion is limited to the two primary dimensions of control: (1) a distinction between internal and external sources of control and (2) a distinction between formal and informal control.

Internal versus External Control

The location of control – whether internal or external to the individual – is an important differentiator of control theories of crime. Internal control refers to mechanisms that function within the individual and include such characteristics as self-control (Gottfredson and Hirschi, 1990), morality (Wikström et al., 2012), and the like. These kinds of individual characteristics are expected to influence individual behavioral choices in ways that may alternatively decrease or increase the chances of crime commission, but not as motivations for crime. No special motivation is needed for a control theory of crime, since the benefits of many types of crime (e.g., financial) will be obvious to nearly everyone. Rather, from the perspective of a control theory, these kinds of individual characteristics have the potential to prevent crimes from occurring by operating in ways that highlight the negative consequences of crime for an individual. For example,

 http://dx.doi.org/10.1016/B978-0-08-097086-8.45047-6

according to Gottfredson and Hirschi (1990), individuals with low levels of self-control will have short-term orientations and make behavioral choices without thinking through the long-term consequences. An implication is that criminal acts – something that involves the use of force or fraud – will be more attractive because of the immediate benefits provided to the offender. In a similar way, Wikström and colleagues (e.g., 2012) explain how an individual's level of morality – how strongly the person holds common values of right and wrong – will influence behavioral choices. For an individual with a high level of morality, criminal and delinquent acts will be avoided, because they conflict with the individual's personal morality – that sense of whether an act is right or wrong. In both of these cases, the individual characteristic – self-control or morality – is viewed as the mechanism that inhibits criminal acts from being committed by emphasizing the negative personal and social consequences of crime.

External control refers to mechanisms of control located outside the individual. A strictly external source of control would be direct supervision or surveillance by another person or group. Most individuals will avoid committing criminal acts when they know they are being watched – by a parent or spouse, by a camera, by a supervisor at work, or by a police officer with a radar gun alongside a highway. There is no social meaning attached to these types of situations, just that the individual is inhibited from committing some acts out of a concern of being caught and the personal, social, and/or legal consequences that would likely follow.

External controls may also reflect the ties that individuals have to a variety of social institutions. These kinds of controls fall somewhere between strictly internal and external controls and have been referred to as a form of 'virtual supervision.' This is control that comes from both internal and external sources. Most commonly, the external source of control is assumed to be family, peers, school, the workplace, and other social institutions to which individuals are connected. The parent, the teacher, or the supervisor may not be physically present to offer supervision over the individual, but they are psychologically present within the individual, so that they have the power to affect behavioral choices – hence the notion of virtual supervision.

How is this kind of supervision possible? For control theory, the key theoretical mechanism is some notion of a 'social bond' (Hirschi, 1969) that represents how well connected an individual is to any number of conventional social institutions. The stronger the social bond, the stronger the ties of the individual to conventional society and a reduced likelihood of crime, because the social costs of crime outweigh whatever immediate benefits may be provided by the crime. This does not mean that individuals are engaged in some kind of rational calculus about how or whether a criminal act would have social costs and how to quantify these costs. Rather, it is the idea that engaging in some act, should it be found out by one's parents, peers, or spouse, would create difficult interpersonal situations that most people will prefer to avoid, which consequently inhibits a great many acts.

Two other examples are useful for highlighting the notion that internal controls are inextricably linked to external controls and that separating the two types of controls is often difficult. Hirschi's (2004) reconceptualization of the social bond and linking it to self-control provides one example, while Wikström's (Wikström et al., 2012) situational action theory and its emphasis on morality provide another example. In both approaches, an individual-level characteristic is conceptualized through an individual's links to conventional society. For example, Hirschi (2004) suggests that self-control can be measured, in part, by the level of attachment to a parent, which has traditionally been viewed as a measure of the social bond (Hirschi, 1969). This assertion reflects the notion that internal controls condition external controls – the ability of a spouse or a parent to influence behavioral choices will be contingent on the degree of internal control an individual has, and whether the social consequences of an action are given any consideration. Put another way: Does the social tie matter for the individual? If yes, to what degree? Alternatively, Wikström and colleagues' (Wikström et al., 2012) conceptualization of individual morality as how strongly the person holds common values about right and wrong grounds an internal control within an external control, again blurring the lines between internal and external sources of control, but with a theoretical mechanism that works in much the same way as that described by Hirschi (1969, 2004).

Formal versus Informal Control

The second primary dimension on which to consider sources of control is a dimension of formal and informal sources of control. Formal sources of social control are typically represented by the criminal justice system and the role that legal sanctions – both threat and application – may play in affecting behavioral choices. Perhaps the most common form where this concern appears in the criminological literature is in the application and test of 'deterrence theory,' where the key idea being assessed is the expectation that individuals will consider the costs and benefits of potential criminal acts. When the potential costs of crime – indicated by legal sanctions – outweigh the potential benefits, deterrence theory suggests that individuals will refrain from committing crimes. It is enough to note here that it is the expected role of the state, through the application of laws and sanctions, by the criminal justice system that is the primary source of control over the behavior of individuals.

In contrast to the emphasis on formal institutions of social control, informal controls refer to a wide range of social institutions, such as, the family, the school, the workplace, as well as the friends and peers of the individuals. The mechanism that links any informal social institution to behavioral choices is comparable to that linking a formal institution of social control to crime: Behavioral choices have consequences for the individual and their social ties. Considering the extent to which a criminal act would make an important social relationship vulnerable, individuals would less likely engage in that behavior. Hirschi's (1969) description of the social bond and its potential to affect behavioral choices helped to clarify the role that family, school, and peers play as sources of control. Specifically, the stronger the emotional attachment and commitment to any conventional social institution, the less likely criminal choices become, due to restrictive impact of the social institution on the individual's behavior. For example, youth with close relationships with at least one parent are less

likely to commit criminal acts out of concern for maintaining that relationship and not wanting to disappoint that parent. This is the 'virtual supervision' noted above that helps to regulate behavioral choices, as the youth thinks about how a parent might react is present to see what was going on (Hirschi, 1969).

Varieties of Control Theory

A focus on specific examples of control theory reveals that there are often two primary ways of distinguishing the control theory mechanism within each explanation. One distinction pertains to the level of explanation: Does the theory try to explain crime at the level of the individual (a micro-level approach) or at the level of the neighborhood, community, or some larger geospatial unit of analysis (a macro-level approach)? In addition, control theories can be distinguished by whether they are seemingly static and attempt to explain crime at some fixed point in time or dynamic and attempt to explain crime over time. These two ways of distinguishing control theory mechanisms are complementary, leading to the possibility of control theories that are micro-static, micro-dynamic, macro-static, and macro-dynamic.

The following discussion highlights some of the exemplars of different varieties of control theory. Although each theory to be discussed may not be viewed as a control theory by their primary proponents, the key mechanism for each one is that weak control of individuals results in a higher likelihood of crime. The specific sources of control vary across the different explanations, consistent with the internal–external and formal–informal dimensions noted above, but when pushed to explain why crime becomes more or less likely, each of them relies on a notion of weak control.

Macro- versus Micro-Control Theories

One of the more common misconceptions that appears in the research literature is for many authors to assume that control theories are micro-level theories of crime, such as, those described by Hirschi (1969), Gottfredson and Hirschi (1990), Sampson and Laub (1993), and Laub and Sampson (2003). In contrast, other authors have taken a more ecumenical approach to control theory and begin with the view that control theories are macro-level explanations of crime first and micro-level explanations, second. For example, Kornhauser (1978) used the control theory label on social disorganization theory as well as a number of other macro-level theories of crime in a way that allowed her to distill the common themes of many different versions of control theory. Her approach makes a great deal of sense: Control theory is based on a conception of social order that is separate from cultural values, that is, norms that prohibit nearly all forms of assault, murder, theft which are by necessity universal (Kornhauser, 1978, p. 40). This makes control theory inherently a macro-level theory of crime, even if the focus turns to individual characteristics, such as, morality, self-control, or the social bond. The following discussion of control theories is brief, but intended to highlight some of the key works that have been the basis for numerous other tests in the research literature and ongoing theoretical development in criminology.

At the macro-level, social disorganization theory, whether it is the classic statement by Shaw and McKay (1942) or the more recent reframing of disorganization theory by Bursik (1988), locates the cause of crime in the breakdown of social institutions. There are numerous forces – economic, cultural, social – that lead to the deterioration of social ties to and within these institutions; but at the end of any sort of 'causal explanation' of crime is the notion that it is weak social institutions, and the inability of those institutions to regulate (control) the behavior of individuals that leads to more crime. Sampson's many contributions to the development of the notion of 'collective efficacy' as an explanation of crime follow in this tradition (see, e.g., Sampson, 2012; Sampson et al., 1997) by describing how the dynamics of social institutions within a community (however defined) have the effect of inhibiting (or not) criminal behavior. Collective efficacy is usually defined as the shared expectations about social control (e.g., Sampson, 2012, p. 152). More efficacious communities are expected to have lower crime rates, because residents of those communities exhibit a greater level of social cohesion, reflected in the strength of social ties to each other and social institutions, as well as higher expectations of community action aimed at preventing problems from occurring. Initial statements of routine activities focused on macro-level explanations for patterns of crime (Cohen and Felson, 1979; Felson and Cohen, 1980, 1981) that highlighted the importance of social ties, but in the form of supervision. One of the important claims made within the routine activities approach was the impact of economic conditions on the weakening of social institutions and how weaker social institutions were less capable of providing adequate supervision of both individuals and property in neighborhoods, resulting in higher rates of both property and violent crime.

Micro-level control explanations are more commonly thought of as control theories of crime. This is likely a consequence of the impact of Travis Hirschi's *Causes of Delinquency* (1969), which focused on explaining delinquency among adolescents and has become one of the classic statements of a control theory. For Hirschi, it was the strength of the social bond – the level/degree of attachment, of commitment, of involvement, and of belief to conventional others – that was key to understanding crime. Individuals with weak social ties were less likely to be influenced by conventional others and more vulnerable to commit crime. More recently, Gottfredson and Hirschi's (1990) linking individual propensity (self-control) to crime with social situational characteristics (opportunities) provides a further elaboration on why social ties may be more or less effective at controlling the criminal behavior of individuals. Recent research on the routine activities of youth and adults has helped to more directly identify the mechanisms through which individual characteristics make some persons more or less likely to commit crimes (Osgood et al., 1996; Wilcox et al., 2003).

More recently, there has been an expansion of what might be called multi-level theories of crime that link the macro- and micro-level explanations of crime. Over the past two decades, this has been one of the key areas of research attention, with the theoretical mechanism driving much of the work

attributed to Sampson (e.g., 2012; Sampson et al., 1997). In particular, Sampson's (2012) *Great American City* is a comprehensive study of social conditions and crime and attempts to integrate years of work that have been more strictly focused on macro- or micro-level explanations. Of note, from a control theory perspective, Sampson's (2012) approach shows time and again how the characteristics of a neighborhood, or community, affect social ties to a range of other social institutions at the micro-level. Ultimately, Sampson's theoretical approach locates the primary 'cause' of crime in the weakened control of individuals.

Static versus Dynamic Control Theories

Static theories of crime typically focus on trying to explain patterns of crime at a single point in time, while dynamic theories of crime focus on trying to explain how changes within individuals over time affect criminal behavior. Much of the more recent effort in micro-level control theories has tended to focus on developing dynamic theories of crime, relying on concepts in developmental psychology and life course sociology. Unfortunately, some authors use the descriptor 'static' for a theory in a way that often has a pejorative connotation, yet many of the 'dynamic' theories of crime use a static version as the foundation for the explanation and become dynamic when the author incorporates elements of time into the explanation.

Two of the most frequently cited and tested control theories of crime are typically described as static. Hirschi's (1969) description of the social bond and its link to crime took the strength of the social bond at a point in time as a given parameter. How the social bond had been strengthened or weakened over some period of time was viewed as less important. Rather, if one was trying to explain recent patterns of criminal behavior, the expectation was that the strength of social ties at that point in time the crime had been committed was of greatest importance. The factors that led to the bond being weakened or strengthened did not alter the proximity of the current social ties to crime. In a similar way, Gottfredson and Hirschi's (1990) linking of low self-control to crime dismissed the idea that the factors affecting the individual's level of self-control were necessarily predictors of criminal behavior. Again, the proximal cause of crime was self-control, and to a lesser degree opportunity. How or whether an individual's self-control was increasing or decreasing over time did not matter as an explanation that at a fixed point in time, level of self-control affects the likelihood of crime.

More recently, Laub and Sampson's (Laub and Sampson, 2003; Sampson and Laub, 1993) age-graded theory of informal social control, links changes in social ties to changes in criminal behavior across the life course. In general, they argue that as social ties to conventional others increase across the life course, for example, through marriage and/or becoming a parent, criminal behavior becomes less likely due to the increasing social costs of crime. From a theoretical perspective, there is no incompatibility between their work and that of either Hirschi's (1969) or Gottfredson and Hirschi's (1990). For all of these perspectives, the key theoretical mechanism is the strength of social ties – crime is higher among those individuals with weaker social ties to conventional others. Laub and Sampson's (2003; Sampson and Laub, 1993) theoretical perspective is a straightforward and important extension of Hirschi's (1969) social control theory that focuses attention on explaining changes in criminal behavior over time, rather than criminal behavior at some fixed point in time.

Empirical Support for Control Theories of Crime

Control theories of crime are perhaps the most frequently tested theories in criminology and have been for several decades. In large part, this stems from the theory being stated in ways that facilitate measurement and empirical tests. The following discussion does not attempt to provide a comprehensive summary of the research literature and its support for control theories of crime. Instead, the intent is to highlight some of the key findings on the correlations of crime most relevant to control theories.

At the micro-level, the key findings focus on the individual propensity to commit crime, the effects of families, the effects of peers, the effects of the routine activities of youth and young adults, and patterns of versatility and stability in offending. In an early meta-analysis of the effect of self-control on crime, Pratt and Cullen (2000) found moderately strong evidence for a relationship between self-control and crime. In the years since their analysis was published, numerous studies have continued to document a persistent relationship, regardless of how self-control or some other measure of individual propensity may have been measured. In what represents an important shift from initial reactions to Gottfredson and Hirschi's description of self-control theory (e.g., Grasmick et al., 1993), it is more typical now for an individual propensity to crime to be assumed as a given parameter and included as a 'statistical control' variable in a multivariate analysis, where the researcher's attention is focused on some other measure's relationship with crime.

Much of the history of the study of crime has found evidence for family effects. Of particular note, the structure of the family matters less than the relationships within the family (see, e.g., Farrington et al., 2012). Parental separation, perhaps through death or divorce, has often been correlated with increased delinquency, but it appears to be largely a function of changes in effective parental supervision (Demuth and Brown, 2004). What seems to matter most is the quality of the parenting (see, e.g., Farrington et al., 2012; Piquero and Jennings, 2012; Sampson and Laub, 1993) – ineffective parenting skills result in children and youth who have trouble outside home and consequently a greater likelihood of criminal activity.

Another longstanding correlate of crime is the effect of peers. Until recently, much of the research on peer effects relied on the self-reported behavior of peers, which was rightfully viewed with suspicion: How well would an individual know about the criminal behavior of his or her peers unless being present for it? This has led some researchers to assume that reports of peer crime are simply another measure of self-reported crime (e.g., Gottfredson and Hirschi, 1990). More recently, however, the more frequent collection of peer network data, where individuals and their friends are surveyed separately, has demonstrated that peer effects observed in prior self-report

delinquency surveys are not spurious. In analyses using network data, a consistent pattern of comparable levels of self-reported crime across peers has been reported (e.g., Haynie et al., 2005). What these data have been unable to answer, thus far, is why peers have comparable levels of crime (e.g., Warr, 2002).

The adaptation of the routine activities approach to individual-level data has confirmed a number of expectations in the field, showing that youth who have more free time in unstructured activities have greater levels of crime and victimization (Osgood et al., 1996; Wilcox et al., 2003). This research has been key to understanding how individual-level characteristics that make individuals more or less crime-prone interact in important ways with various social conditions. In some cases, the social conditions will inhibit crime, regardless of the individual's propensity to commit an act, while other social conditions will enhance the possibility that crime occurs (Felson, 2006; Wikström et al., 2012). Importantly, too, this research has shown that an individual's propensity to commit crimes affects choices of social settings – more crime-prone individuals will tend to seek out crime-prone social situations, and vice versa (Wikström et al., 2012).

Gottfredson and Hirschi's (1990) self-control theory of crime was based on the empirical findings of versatility and stability in offending patterns – two facts of crime that Hirschi (1969) was not aware of at the time he wrote *Causes of Delinquency*. The many findings on the versatility and stability of offending (e.g., Britt, 1996; Farrington et al., 1988) have been some of the more important new empirical regularities uncovered in the field, since Hirschi's initial test of social control theory. It is difficult to apply many of the other theories of crime to explain why the primary correlates of criminal behavior also tend to be the strongest correlates of other behaviors, such as, accidents, injuries, failure of personal relationships, and a poor employment history (see, e.g., Laub and Sampson, 2003; Piquero et al., 2007).

At the macro-level, the key findings focus on routine activities, collective efficacy, institutional anomie, and concentrated disadvantage. Cohen and Felson's (1979; Felson and Cohen, 1980, 1981) research on a macro-level routine activities approach to understanding post-World War II crime rates marked an important shift from traditional notions of social disorganization, but relied on many of the same indicators of social problems to try to explain patterns of crime. The key findings from this research – demographic, economic, and other indicators of social change affected rates of crime – reinforced some of the basic claims of social disorganization theory as highlighted in Kornhauser (1978), but explained the links in different ways. More importantly, perhaps, the macro-level research on routine activities in the 1970s and 1980s helped to set the stage for a new wave of theoretical development and research on macro-level causes of crime.

Collective efficacy refers to social cohesion and trust among residents of a neighborhood that interacts with expectations for social control (Kirk, 2010; Sampson et al., 1997; Sampson, 2012). From a more traditional social disorganization perspective, collective efficacy represents the strength of social ties among individuals in a neighborhood that affect the likelihood of crime: the greater the collective efficacy of a neighborhood, the greater the inhibitor to crime. The argument holds both cross-sectionally and longitudinally – whether comparing neighborhoods at a single point in time or a single neighborhood over time, the efficacy of a neighborhood results in a greater ability to monitor and regulate the individuals within that neighborhood, reducing the chances of crime.

A closely related set of findings focuses on what has been labeled institutional anomie (Messner and Rosenfeld, 2007). Instead of thinking about social cohesiveness in terms of the accumulation of individual social ties, institutional anomie considers the cohesiveness of specific social institutions, such as the economy, the family, and the education system. Much of the research aimed at testing institutional anomie theory has found that when traditional institutions of social control – families, churches, schools – become less effective, perhaps due to changes in the economy, then these institutions become less effective at regulating populations, which in turn leads to more crime. The mechanism is similar to that of collective efficacy, but the conceptualization of social cohesiveness and what it represents differs.

Concentrated disadvantage represents a variety of socioeconomic conditions, including poverty, unemployment, and public assistance, that tend to be positively correlated with each other and more prevalent in those neighborhoods with low levels of collective efficacy and social cohesion. Those neighborhoods with high unemployment rates will also tend to have higher rates of poverty (overall and child), as well as higher levels of public assistance, combining to indicate the level of economic difficulty/disadvantage across neighborhoods. Again, a consistent finding has been the positive correlation of concentrated disadvantage with crime rates – neighborhoods with greater socioeconomic problems have higher rates of crime (e.g., Morenoff et al., 2001), but it is not concentrated disadvantage that directly causes crime. Rather, concentrated disadvantage weakens social ties of the residents in those neighborhoods, which in turn frees individuals to commit crimes.

Overall, some of the most consistent findings in criminology over the past 30+ years have focused on the individual and the situational/social characteristics best explained by control theories of crime because of the effect they have on traditional forms of informal social control, which in turn affect the likelihood that individuals commit criminal acts. Interestingly, many of the publications that have contributed to our knowledge base did not set out to test or to add to the evidence in support of control theory. Yet, when the most consistent predictors are individual propensity, family ties, versatility and stability in offending, routine activities (micro and macro), concentrated disadvantage, and various forms of social cohesion at the neighborhood or community level, the empirical evidence points to a solid body of research that supports the central claims of control theories of crime.

Abstract

Control variables refer to variables whose effects on an outcome variable are statistically adjusted in order to estimate causal effects of an explanatory variable. This article discusses methods of controlling for both observed and unobserved sources of confounding. Regression and propensity score are presented as methods in the context of various research designs. Methods that rely on conditioning on observed variables are effective if all sources of confounding are measured and included in the analysis. These methods produce biased causal estimates in the presence of unobserved confounding. Instrumental and mediator variables are presented as methods for estimating effects of the primary explanatory variables in the presence of such confounding.

An important goal of empirical research is to support causal assertions about the effects of explanatory variables on outcome variables. Extraneous variables that influence the outcome represent potential confounds whose effects must be eliminated before causal assertions regarding the explanatory variable can be made. In its broad sense, the term 'control' refers to a researcher's systematic attempts to eliminate the confounding effects of extraneous variables associated with sampling, measurement, experimental manipulation, randomization, and statistical adjustment. The term 'control variable' is used most commonly in the narrow context of statistical adjustment of potential confounds.

The current presentation of 'control variables' is guided by three broad tenets. (1) Strategies of statistical control and its interpretation depend on an understanding of the nature of the relationship between extraneous variables and the explanatory and outcome variables. The term control variable is best understood within this broader explanatory framework. (2) The nature of potential confounds and therefore the need for their statistical control depends on the specific research design. The need for statistical control increases as the inherent controls imposed by the research design diminish. (3) The potential confounding variable may be observed or unobserved. Although most methodological and empirical literature on statistical control focuses on the control of observed variables, this article is organized around prototypical methods of controlling for both observed and unobserved sources of extraneous variability. This approach highlights the importance of a causal framework for understanding statistical control and also pinpoints the most common cause of the failure of observed variables methods, i.e., the presence of unobserved sources of confounding (Morgan and Winship, 2007).

Controlling for Observed Variables

Several methods of control are available when it can be assumed that the potential confounding variables are measured including regression, matching, and propensity score. Regression (Pedhazur and Pedhazur, 1991) or analysis of covariance (ANCOVA; Hutiema, 1980) based approaches are the most commonly used methods of statistical control. The purpose and interpretation of regression adjustment depends on the specific research design employed.

Regression and ANCOVA-Based Approaches

Regression of a dependent variable Y on an independent variable X provides an estimate of the causal effect of X on Y under the critical assumption that all omitted variables C that influence Y are uncorrelated with X. If an omitted extraneous variable C that influences Y is also correlated with the independent variable X, then the regression parameter is biased as a measure of direct effect of X on Y. In this case, the effect of explanatory variable X is confounded with the extraneous variable C. The true direct effect of X on Y (a in Figure 1) may be obtained by measuring and including C in the model. The key assumption made in regression-based approaches is that all extraneous variables are measured without error and included in the analysis.

Regression Adjustment in Randomized Experiments

Randomized experiments (Cook and Campbell, 1979) offer the most robust method for making causal inferences and imply two powerful means of control. These are: (1) the independent or explanatory variable is controlled by direct

Figure 1 Path "*a*" shows the direct effect of the treatment on outcome after controlling for the effect '*b*' of the observed covariate.

manipulation. (2) All other sources of extraneous variability are controlled by randomization or chance. Random assignment, *if successful*, makes experimental and control groups probabilistically equal with respect to all potential confounding variables and hence minimizes bias due to initial differences among treatment conditions. As a result, extraneous variables are expected to be uncorrelated with the manipulated variable or the treatment assignment and their exclusion does not bias the estimates of treatment effects. On the other hand, including such variables in analysis reduces the unexplained within-group variability in the outcome, thus increasing the power for detecting treatment effects. Pretest measures of the dependent variable are frequently used for this purpose. It is important to note that randomization may fail to make the experimental conditions equal with respect to various confounders. In addition, noncompliance and attrition may render various treatment conditions noncomparable.

Regression Adjustment in Quasiexperimental and Nonexperimental Designs

In quasiexperimental designs, the independent variable is manipulated in the absence of random assignment. In these designs, subjects may be nonrandomly assigned to or may self-select themselves into different conditions. For example, in a study investigating the effects of remedial education on achievement, students who are expected to benefit the most may be assigned by the researcher into the treatment condition. As a result, the groups may not necessarily be equal at baseline with respect to various observed and unobserved characteristics that may influence the outcome of the treatment. In nonexperimental settings, the researcher may wish to infer causation from the observed association between a hypothesized independent variable and an outcome, e.g., the effect of smoking on lung cancer.

The purpose of regression adjustment in nonexperimental designs is to make the experimental conditions statistically equal with respect to various observed characteristics that may also influence the outcome. The success of regression-based approaches in quasiexperimental and observational research depends on the plausibility of the assumption that all potential confounding variables are measured without error and included in the analysis. This assumption may not be tenable in most quasiexperimental settings where self-selection or assignment to treatment may be based on unmeasured expectations about outcome under treatment and control conditions.

The observed characteristics that are typically controlled to include the pretest measure of the outcome variable and background characteristics such as gender, age, and socioeconomic status. The control variable frequently serves as a proxy for some other unmeasured theoretical variable of interest. This method of controlling for theoretical variables is a common practice in applied settings and leads to a number of additional problems. Proxy variables, unlike the measured indicators of a construct, contain *both* random error as well as unspecified sources of systematic errors. The presence of random measurement error in regressors leads to biased estimates of the regression parameters. On the other hand, the presence of systematic variability other than the hypothesized construct introduces new and unspecified sources of bias. As a result, the use of background characteristics as proxies in evaluation research may result in contradictory findings regarding the effects of the explanatory variable in question depending on the specific set of covariates included in the analysis.

Control Variable: Validity and Differential Treatment Effectiveness

The use of control variables for statistical adjustment is motivated primarily by a desire to increase the internal validity of the study. An alternative way of eliminating confounding due to extraneous variables is to include only those individuals at a specific level of the confounding variable. For example, if ethnicity and gender are related to the treatment assignment and to outcome, the researcher may choose to include only white males in the study. Such control by exclusion limits the generalizability of the findings to the population actually included in the study. In contrast, the regression-based approach allows generalization across all levels of the controlled covariate present in the sample if the treatment effects are the same within each level of the covariate. In other words, the possibility of differential treatment effects across levels of the covariate must be ruled out before the results can be generalized. For example, a specific intervention for treating childhood aggression may be more effective at higher levels of initial aggression. In this case, the initial level of aggression could be included in the analysis along with an interaction term with the manipulated variable to test if the magnitude of the treatment effect depends on the level of the observed covariate. When the interaction between the independent variable and a covariate is significant, the covariate is said to moderate the effect of the independent variable on the outcome. In this situation, the arbitrary distinction between an explanatory and a control variable begins to blur. The researcher must now explore the mechanism of differential treatment effectiveness and ascribe proper causal status to both the covariate and the explanatory variable.

Propensity Score

In contrast to the regression approaches, the propensity score approach explicitly models the treatment selection/assignment process using the *observed* background characteristics. The *propensity score* $P(T|C)$ is the probability that an individual with a given set of background characteristics C will be assigned to a particular treatment group (Rosenbaum, 1995; Rubin, 2006). If C also has an effect on the outcome variable, then conditional on the propensity score, the treatment assignment will be random with respect to the outcome. The propensity score captures the collective influence of all observed covariates on treatment assignment. In other words, by controlling for the propensity score, it is possible to control for all observed characteristics that determine treatment assignment. This can be achieved by including the propensity score in the regression equation (Figure 2) or by matching on propensity score. The propensity score may be estimated using logit or probit regression by regressing observed treatment assignment on the set of covariates and their interactions.

Controlling for Unobserved Variables

Both the regression and propensity score methods make a strong assumption that all potential sources of confound are

Figure 2 Path "*a*" shows the direct effect of the treatment on outcome after controlling for the effect '*b*' of the propensity score estimated using two observed variables *C*1 and *C*2 (not shown).

Figure 3 Path "*a*" shows the direct effect of the treatment on the outcome independent of the correlation (*r*) between the residuals for the treatment (*u*) and the outcome (*v*). This effect is identified by the presence of an instrumental variable that is presumed to influence the outcome exclusively via its effect on the treatment assignment (path *b*).

measured and included in the analysis. It is likely that selection into or exposure to a treatment depends on a subject's expectations regarding the outcome. For example, an individual's implicit beliefs regarding expected outcomes in the treatment and control groups may influence their decision to participate in a particular treatment as well as the eventual outcome. Even in randomized experiments, treatment compliance and attrition may be related to such unobserved variables. In this situation, observed background characteristics may not contain relevant information regarding a subject's decision process. As a result, methods of control based on observed variables are likely to produce biased estimates of treatment effects. Rosenbaum (1995) provides methods of assessing the sensitivity of the results to potential hidden biases in the context of observational studies. The problem of isolating true causal effects from observed association in the presence of latent confounds can be thought of as an identification problem. If one is willing to make certain assumptions about the nature of treatment effects under various conditions, it is possible to express treatment effects using inequalities or bounds (Manski, 1995).

Alternatively, the identification issue can be resolved by measuring additional variables that are causally related to the explanatory and outcome variables but are *assumed* to be independent of the unobserved confounds. In other words, the presence of such variables allows the true causal effects of an independent variable to be isolated from the unobserved sources of confounds. Such variables can help identify the true causal effects under two circumstances: (1) if the effects of these variables on the outcome are entirely mediated by the independent variable or (2) if the variable mediates the effect of the independent variable on the outcome.

Instrumental Variable Method

The instrumental variable approach for controlling unobserved sources of variability is the *mirror opposite* of the propensity score method for controlling observed variables (Angrist et al., 1996). Unlike an observed control variable, an instrumental variable is *assumed not* to have any *direct effect* on the outcome. Instead, the instrumental variable is thought to influence only the selection into the treatment condition. In other words, the effect of the instrumental variable on the dependent measure is entirely *mediated* via its effect on treatment assignment (*b* in Figure 3). This condition is also known as *exclusion restriction*. If the independent variable were regressed on the instrumental variable, the residual would contain all unobserved sources of variability that determine treatment assignment and also influence the outcome variable (represented by the correlation *r* in Figure 3). As a result, the existence of an instrumental variable *identifies* or *isolates* the average direct effect (*a* in Figure 3) of the treatment on the outcome independent of the unobserved sources of variability. The success of this strategy rests on the reasonableness of the assumption of exclusion restriction (Heckman et al., 2006).

Mediator Variable Method

The effects of unobserved confounds may be isolated in a radically different fashion by modeling the causal mechanism by which the treatment influences the outcome (Pearl, 2009). In this approach, the goal is to find an observed variable that *mediates* the effect of the independent variable on the outcome *but is unrelated to the unobserved common cause* (Figure 4). For example, in the past cigarette companies have claimed that the relationship between smoking and lung cancer is spurious: a result of a gene (common cause) that leads to craving for tobacco and also causes lung cancer. If such a common cause in fact existed, it is still possible to isolate the independent effect of smoking on lung cancer by identifying a variable that mediates the effects of smoking on cancer but is *not influenced by the hypothesized common-cause*. For example, tar in lungs is one such variable known to cause cancer which accumulates in lungs as a result of smoking, passive smoke inhalation, and environmental pollution. It is reasonable to argue that the level of tar in lungs is not caused by the common gene, especially among the passive smokers. The existence of such a mediator

Figure 4 The direct effect of the mediator on outcome is represented by "*a*" and that of the treatment assignment on the mediator is represented by "*b*." The unobserved common-cause of treatment assignment and outcome is assumed not to influence the mediator. As a result, the mediated effect of the treatment on the outcome ($a \times b$) is independent of the confounding due to plausible common cause.

variable can statistically identify the effect of the independent variable on the dependent variable ($a \times b$ in Figure 4) even in the presence of unobserved sources of confounding. It is to be noted that the instrumental and mediator variables are not control variables themselves. Instead, the use of these variables identifies true treatment effects by isolating the confounding effects of other unobserved sources of variability.

Conventions and Norms: Philosophical Aspects

Richard H McAdams, University of Chicago Law School, Chicago, IL, USA

© 2015 Elsevier Ltd. All rights reserved.

Abstract

Conventions and norms are distinct but overlapping social regularities. 'Convention' has been variously defined as a type of agreement, a jointly accepted principle of action, and a set of coordinated expectations that solve a recurrent coordination problem. The related meaning of 'norm' is a regularity of behavior among a population of individuals, where the regularity is at least partly sustained by the fact that at least most individuals approve conformity to the regularity and/or disapprove nonconformity. Game theory addresses how conventions arise without agreement, but the process turns out to be difficult to explain based on rationality alone. Some theorists contend that norms are based on emotion rather than rationality, but others contend that the rational pursuit of interest can explain norm origin.

Conventions and norms have various meanings. Of importance to the social sciences, they refer to particular types of behavioral regularities and/or the beliefs or reasons that sustain the regularities. A predominant view of 'convention' is that it describes a kind of equilibrium behavior among individuals in a recurrent coordination problem, a basic feature of which is the existence of at least one potential alternative equilibrium. Others view conventions as a type of agreement or a jointly accepted principle of action. 'Norm' has several meanings. It can refer to a mere statistical regularity or, in moral theory, a prescriptive rule for human behavior. In the sense pursued here, however, a norm describes a regularity of behavior among a population of individuals, the central feature of which is that most or all the individuals approve conformity to the regularity and/or disapprove nonconformity. Thus, conventions and norms are distinct but overlapping social regularities.

Introduction

A few (putative) conventions will identify the topic and illustrate its importance. A common example is the regularity of driving on only one side of the road (left or right). Another is monetary currency (see Hume 1978[1740]: p. 490). The convention here is to treat a particular form of metal or paper as having value sufficient to exchange it for goods and services whose value is otherwise (without the convention) far greater. In each case, an individual wishes to follow the regularity once it arises – to avoid the danger of driving into oncoming traffic or the inefficiency of barter. Yet these conventions are arbitrary: everyone driving on the left works like everyone driving on the right; everyone accepting one paper form as currency works much like everyone accepting another.

Language is similarly thought to be conventional because different sounds or symbols could be used to refer a given thing, but to communicate successfully, an individual is better off using the sounds or symbols that others use. One might object to the idea that all of language is a convention if a convention is thought to require a convening, i.e., an actual agreement. An agreement to use certain sounds as language must be expressed in language, so some language must exist prior to any agreement-based convention (see Quine, 1967 [1936]). Lewis (1969) and others have since argued that a convention can occur without any agreement, suggesting that language may indeed be conventional.

Hume (1978[1740]: pp. 477–513) contended that justice, particularly the institution of property, was a convention (see Vanderschraaf, 1998a). Some theorists give conventions a central role in the theory of morality or law (see Law and Morality: An Analytical Perspective; Law and Morality: A Continental European Perspective; Social Work Ethics). Conventions and norms (discussed below) also explain 'spontaneous order' that arises without a centralized force such as the state. If so, conventions (or norms) might sustain some forms of cooperation in the 'state of nature' and thereby complicate or refute social contract theories that justify the state by the disorder that exists in its absence (see Skryms, 1996; Taylor, 1987). Once the state exists, spontaneous order may limit the domains in which state power is necessary (see Ellickson, 1991), or contrarily, state action may be necessary to restrict or unsettle undesirable conventions (or norms) (see McAdams, 1997: pp. 409–432).

Defining 'Convention'

Convention as Agreement or Jointly Accepted Principle of Action

On one view, a convention is a 'jointly accepted principle of action' (Gilbert, 1989: p. 377). A principle of action is a rule prescribing (at least presumptively) how to behave in certain situations. An individual can adopt a principle of action unilaterally or jointly. Gilbert (1990: p. 16) gives an example of the latter: *A* chastises *B* for failing to adhere to a previous telephone regularity they had observed (about who calls back when they are accidentally disconnected) without prior agreement. *B* acquiesces in the criticism and apologizes. By this communicative exchange, Gilbert says the parties have created a convention by 'jointly accepting' a principle of action requiring behavior they previously engaged in without convention. More precisely, "A population P has a convention of conformity to some regularity in behavior R in situations of type S if and only if the members of P are jointly committed to accept as a body, with respect to themselves, the fiat: *R is to be conformed to*" (Gilbert, 2008: p. 12). She describes her

account as 'holistic,' in contrast to the individualistic game theory approach described below (p. 5).

Joint acceptance or commitment does not obviously explain the common intuition that conventions are in some sense arbitrary. Marmor (1996) criticized Gilbert for misunderstanding and omitting this 'defining feature' of conventions from her account. More recently, Gilbert (2008: p. 12) explains that her definition captures a sense of arbitrariness because 'no particular rationale' for the commitment 'is presupposed' in the definition, unlike a rule sounding in morality, which has a moral rationale, or tradition, which has a historical rationale. Yet the agnosticism of Gilbert's definition on the rationale of joint commitment does not mean there is not usually or always, for each convention, some rationale. So it is not clear that her approach captures arbitrariness. In any event, if Marmor (1996) and others are right, the kind of arbitrariness required is the existence of an alternative regularity that could serve the rationale of the convention in the manner (although not necessarily as well as) the conventional regularity does.

In addition, Gilbert's telephone example reveals how close this understanding of convention is to the idea that conventions are simply agreements. Arguably *A* and *B* have implicitly agreed because each believes that *A*'s criticism impliedly asserted the existence of a mutual obligation and that *B*'s acquiescence revealed *B*'s assent to this assertion. The joint acceptance idea clarifies how agreements produce conventions, but not how conventions arise without agreement.

Conventions as Solutions to Recurrent Coordination Games

David Lewis' Definition

Lewis' *Convention* (1969) is the origin of a game theory view of convention, one that explicates the way in which they are arbitrary and contends that no explicit or implicit agreement is necessary. Lewis (1969: p. 42) initially modeled conventions as solutions to recurrent coordination games. A *game* is a situation in which the outcome of anyone's action depends on the decisions of other individuals as well as one's own. In game theory, *players* (usually) rationally choose among alternative *strategies*. Each combination of the players' strategies produces an *outcome*, which consists of a utility index for each player (see Rational Choice Explanation: Philosophical Aspects; Game Theory: Noncooperative Games).

Pure coordination games involve purely common interests among the players. Consider people who want to find each other but who have failed to communicate in advance where to meet. Lewis (1969: p. 9) uses the matrix in Figure 1 to describe such a coordination game involving two players and three possible meeting places. One player – 'R' – can play strategies R1, R2, or R3, which consist of going to places P1, P2, or P3, respectively. The other player – 'C' – can play strategies C1, C2, and C3, which consists of going to the same three places, respectively. The players choose their strategies simultaneously, not being able to observe what the other has done. Each receives more utility from meeting (1) than from not meeting (0). (The number in the lower left corner of a cell represents the utility of row chooser; the upper right number is the column-chooser utility.) Each player therefore has an interest (equal in this example) in coordinating his or her action with that of the other player.

	C1	C2	C3
R1	1 1	0 0	0 0
R2	0 0	1 1	0 0
R3	0 0	0 0	1 1

Figure 1 A pure coordination game.

As a result, there are three pure-strategy Nash equilibria, outcomes in which no one player can gain by changing his or her strategy (because each is playing a best reply to the strategies of the other players): R1/C1, R2/C2, and R3/C3. For example, R1 is the best response R can make to C1 and that same strategy – C1 – is the best response C can make to R1. Thus, given R1/C1, neither player would want to switch strategies unilaterally. The same is true for R2/C2 and R3/C3 too. (There are also mixed-strategy Nash equilibria, as where R and C each go to each of the three places with a probability of one-third.)

This analysis reveals the need for *coordinated expectations*. Except by accident, players 'solve' a coordination game only if they have accurate expectations about what the other(s) will do. In the example, each player needs to *expect* the other to go to the same place, for example, P1. But if each player knows the other wishes to meet, then, except by accident, it seems that R will expect to meet C at P1 only if R believes that C expects to meet R there as well. But C will expect to meet R at P1 only if C believes that R expects C to go there. Lewis (1969: pp. 52–60) claims the need for *common knowledge*. Common knowledge of a fact *x* means that everyone in the relevant population believes *x*, believes that everyone believes *x*, believes that everyone believes that everyone believes *x*, and so on, *ad infinitum*. Except by accident, coordination seems to require that each player have common knowledge of what the other(s) will do.

Finally, consider how a coordination game can recur. Such a situation would exist if, on repeated occasions, R and C find themselves involuntarily separated in a crowd and in need of a meeting place. More generally, the question of which side of the road to drive on, what paper to use as currency, and what sounds to use to communicate, all arise repeatedly.

Based on these points, Lewis (1969: p. 78) proposes this definition:

> A regularity *R* in the behavior of members of a population *P* when they are agents in a recurrent situation *S* is a *convention* if and only if it is true that, and it is common knowledge in *P* that, in almost any instance of *S* among members of *P*,

1. almost everyone conforms to *R*;
2. almost everyone expects almost everyone else to conform to *R*;
3. almost everyone has approximately the same preferences regarding all possible combinations of actions;

4. almost everyone prefers that any one more conform to R, on condition that almost everyone conform to R; and
5. almost everyone would prefer that any one more conform to R' on condition that almost everyone conform to R';

where R' is some possible regularity in the behavior of members of P in S, such that almost no one in almost any instance of S among members of P could conform both to R' and to R.

Notice that the convention is not merely the behavioral regularity, but also the set of expectations and preferences that sustain the regularity.

Modifications in Lewis' Definition

In several ways, Lewis' approach is narrow and theorists have proposed modifications. First, Lewis (1969: p. 78) requires common knowledge of all the necessary elements of a convention, even the fact that there is an alternative regularity (condition 5). Burge (1975) observes that requiring common knowledge of the alternative excludes an arbitrary regularity from being a convention merely because most individuals never discover, or later forget, what the alternative is. On this view, a population's language would not be conventional if the population were unaware of the possibility of other languages. Where Burge advocates against requiring common knowledge of condition 5, Skyrms (1998: p. 84) and Binmore (2008: p. 23) more generally doubt that any of the required common knowledge can arise in a large population. They propose instead the tools of evolutionary game theory, which do not require common knowledge or even rational agents. Cubitt and Sugden (2003) and Vanderschraaft (1998b) attempt to reconstruct the common knowledge concept to make it less demanding so as to answer this concern.

Moreover, Lewis's definition insists on two unnecessary features of pure coordination games, requiring (3) 'almost everyone has approximately the same preferences regarding all possible combinations of actions,' and (4) 'almost everyone prefers that any one more conform to R, on condition that almost everyone conform to R'. The latter point means that most individuals conditionally prefer both their own conformity and the conformity of others. Each requirement arguably excludes regularities that are plausibly conventions.

First, there is an element of coordination in many games that also involve conflict. As long as there is some common interest, one may wonder why the equilibrium outcome, when others are possible, is not a convention. For example, in Figure 2 (sometimes called 'the battle of the sexes' based on an early illustration), each player prefers coordinating at Nash equilibria R1/C1 or R2/C2 to either other outcome. But each player also strongly prefers one equilibrium to the other and these preferences conflict. Thus, the players do not have 'approximately' the same preferences for outcomes (which they would if one replaced each 5 with, say, 1.05). Lewis would not count a solution to this game as a convention even though it were one of two equilibria and the players each prefer coordinating at an equilibrium than reaching a nonequilibrium outcome.

	C1	C2
R1	5, 1	0, 0
R2	0, 0	1, 5

Figure 2 A simple mixed motive game.

Another weakness in Lewis' account is his requirement that the players conditionally prefer *other* players' conformity even though the stability of a regularity depends only on players preferring their own conformity. With a mix of common and conflicting interests, players may prefer that other players deviate from any of the multiple equilibria. In Figure 3, R1/C1 and R3/C3 are the only Nash equilibria. As in Figure 1, the players are indifferent between these equilibria and prefer to coordinate on either than to reach other outcomes that are worse for each (R1/C3, R2/C2, and R3/C1). But unlike Figure 1, in each of these equilibria, the players do *not* prefer that the other conform to the equilibrium because each would gain by the other playing a different strategy. At R1/C1, R prefers that C plays C2 and C prefers that R plays R2. The same is true at R3/C3.

Lewis (1969: pp. 45–46) acknowledges the point with this example: suppose those planning to attend a party wish to wear the same style of clothing that others wear. But suppose many 'nasty' people prefer that many others fail to conform to the regularity and thereby suffer embarrassment. Because these nasty people do not conditionally prefer that most others conform, Lewis would not consider it a convention even if, based on coordinated expectations, everyone arrives at the party dressed in the same style. The more common intuition is that, regardless of nasty preferences, a stable and arbitrary clothing regularity is a convention (see Miller, 1986: p. 123).

These examples suggest dispensing with the requirements (3) that players have approximately the same preferences for all outcomes and (4) conditionally prefer that others conform. A convention may then be more broadly but simply defined as the coordinated expectations that sustain a pure-strategy Nash equilibrium, in recurrent circumstances where multiple pure-strategy equilibria are possible, and the behavioral regularity that the equilibrium represents. Some would add stability conditions that narrow the definition. Others would expand the equilibrium concept (see Vanderschraaf, 1995) and possibly include mixed strategy equilibria where individuals play different pure strategies, each with some probability.

	C1	C2	C3
R1	5, 4	7, 2	1, 3
R2	3, 5	0, 0	2, 5
R3	4, 2	7, 3	5, 4

Figure 3 Adapted from Kornhauser, L.A., 1996. Conceptions of social rule. In: Draybrooke, D. (Ed.), Social Rules: Origin; Character; Logic; Change. Westview Press, Boulder, CO, p. 209.

On such a broad view, more regularities are conventions. For example, in an iterated prisoner dilemma game, there can be multiple equilibria, some of which involve strategies of contingent cooperation. Contingent cooperation can then be conventional even though the players do not have approximately the same preferences for all outcomes (see Verbeek, 2008: pp. 77–80). Iterated 'hawk/dove' games may produce conventions even though players do not always prefer others to conform (see Bicchieri, 1993; Sugden, 1986). The definition still excludes behavioral regularities (1) that do not arise from situations of strategic interaction (e.g., breathing and sleeping); and (2) that arise in games with only one equilibrium (e.g., a one-shot prisoner's dilemma).

Additions to Lewis' Definition

Marmor (1996) agrees that Lewis has correctly identified solutions to recurrent coordination problems as conventions, but denies that only these solutions are conventions. Marmor (p. 366) would add a second category consisting of rules 'constituting autonomous practices,' such as the rules of etiquette; the rules of chess, football, or patience; or the rules determining artistic genres and styles. The rules of games like chess and football are not apt examples; however, as they did evolve slowly in what plausibly was an effort of individuals to coordinate on creating a interesting game, rewarding to players and in some cases spectators, and to avoid the coordination failure where teams or individuals from different regions play 'the game' by different rules and therefore cannot fairly play each other. Some sociological explanations of etiquette are also consistent with Lewis as they involve a class of individuals coordinating on complex but arbitrary behavioral rules in order to distinguish themselves from a 'lower' class that fails to master the rules. The question remains open whether all of Marmor's rules constituting autonomous practices may be assimilated into Lewis' framework.

How Conventions Emerge

The simplest way to produce the coordinated expectations necessary for a convention is by *agreement*. When the parties have sufficiently (not necessarily purely) common interests, there is no need to enforce the agreement. If C and R desire to meet, the agreement to meet at P1 may give each a reason to expect the other to go to P1. Neither has a reason to defect from the agreement. But the game theory account of convention purports to explain their emergence without agreement. Some conventions – language and other forms of spontaneous order – seem to require such an origin. How could people form coordinated expectations without agreement?

Much of game theory addresses how players reach equilibrium (*see* Rational Choice Explanation: Philosophical Aspects; Game Theory: Noncooperative Games). The issue is complex and unsettled. It is often quite difficult to demonstrate that players will reach any equilibrium using the common assumption that players are perfectly rational. In a single instance of a coordination game, for example, there is no purely rational basis for expecting a player to select one particular equilibrium outcome. Game theorists believe, however, that players might coordinate on a 'salient' equilibrium or, if the game is recurrent, that players' strategies might evolve to an equilibrium. Consider each idea in turn.

First, empirical data suggests that people can solve coordination problems without agreement. Schelling (1960: pp. 54–58) experimented with such problems and found that the psychological 'prominence' of certain solutions provided the players 'focal points' for coordinating. For example, when the game was selecting a single time of day to meet another, most players selected noon; when asked to select the same positive number, two-fifths selected 1; and when asked to pick a meeting spot on a map, most players selected the only unique feature on the map. Apparently, people sometimes solve coordination problems by selecting what each believes the other is most likely to perceive as unique. Lewis (1969: pp. 35–36) calls this psychological feature salience. As he observes, what is salient need not be the most desirable, but may even be the least desirable equilibrium (but is still more desirable for each than noncoordination).

The empirical effectiveness of salience seems sufficient to demonstrate that conventions can arise without explicit or implicit agreement. But salience itself is difficult to analyze. Salience does not seem to work by rationality alone. Knowing that one equilibrium strategy 'sticks out' from the rest does not justify expecting other players to select it unless one knows that those players favor salient outcomes, which is not required by rationality. Perhaps there is a common metaconvention to pick the salient option, given the frequency of coordination problems. In addition, rationality alone does not explain what is salient, that is, it does not explain how to select among various dimensions by which to evaluate uniqueness. There are many dimensions from which to evaluate whether or which past incident 'sticks out' as being like the present one (see Sugden, 1998a; Gilbert, 1989).

For recurrent games, theorists increasingly offer evolutionary accounts to explain the emergence of an equilibrium. The evolution in these models typically does not occur through greater sexual reproduction of players who enjoy greater success in the recurrent game. Rather, evolution occurs by players, often imperfectly rational, *learning* from experience in the game and switching to strategies that provide greater expected utility (see Skryms, 1996). Evaluating the success of these models is beyond the scope of this article. Some argue, however, that the same problem of induction that affects salience also infects evolutionary models, to the extent they require players to detect the patterns that constitute a game and other players' strategies in that game (see Sugden, 1998a).

Defining 'Norm'

As noted above, a norm can be a mere behavioral regularity among individuals, as the fact that most people in a population drink coffee or tea nearly every morning. In moral theory, a norm can be a prescriptive rule or reason for action. Thus, one could sensibly assert the existence of a moral norm obligating certain behavior even though no one actually adheres to the norm. In a third sense, a norm is a behavioral regularity, but not 'merely' one. It is a regularity sustained in part by the fact that individuals generally approve

(and otherwise reward) conformity and/or disapprove (and otherwise punish) nonconformity. Norms are, therefore, perceived by individuals in the relevant population as obligatory, a regularity one 'ought' to follow, whether or not they are justified in moral theory. The rest of this article discusses this third sense of the term, given its importance to the social sciences.

The definition of norm (in the sense indicated) entails at least three elements (see Pettit, 1990). First, it is a behavioral regularity generally followed by the individuals in a population. This requirement distinguishes a society's mere aspirations for behavior from the norms that its members actually follow. One might want to expand the definition, however, to include cases where most do not follow the regularity but most *either* follow the regularity *or* bear significant costs to conceal their nonconformity. For example, one could coherently say there is a norm against adultery in a community even though only a minority of its members refrain from adultery, because the remaining members incur nontrivial costs to prevent others from discovering their adultery.

Second, a norm is a regularity in which conformity is approved and/or nonconformity is disapproved. On a broad view, the approval and disapproval need not be morally justified or even based on principle but may include the simple attitudes of being positively or negatively inclined toward – liking or disliking – the behavior. Pettit (1990: p. 731) suggests a third requirement: that the pattern of approval and disapproval 'helps to ensure' the existence of the regularity. The causal contribution may be unconscious and contingent, in that other considerations may usually suffice to sustain the regularity but the (dis)approval pattern fills in when those considerations fail. One may also follow Pettit (1990: p. 751) in requiring some kind of common knowledge of the existence of the above three elements, although, for the reasons discussed above concerning conventions, one might imagine that regularities recognizable as norms arise across societies despite the failure to create common knowledge of all three elements.

Some theorists conceive of conventions as a subset of norms (see Marmor, 2006: p. 349), but on the view stated here, the two concepts are distinct (although in practice there is overlap). Conventions do not require approval of conformity and/or disapproval of nonconformity, while norms do not need to be arbitrary in the sense of there existing an alternative means of coordinating.

The Origin of Informal Norms

Legal norms are formal; they are promulgated and enforced by the centralized authority of the state. Nongovernmental organizations also formally promulgate and enforce norms. But some norms arise and are enforced informally and without centralized authority. Informal negative sanctions include censure, gossip, ostracism, and violence. Positive sanctions include praise and the provision of social and economic opportunities. Beyond external sanctions, one may approve or disapprove one's own conformity or nonconformity, respectively, and experience pride or guilt. Informal norms are important because they contribute to spontaneous order, which has implications for, among other things, political theory.

A key question is how informal norms first arise. What causes the behavioral regularity and what causes people to embrace it as obligatory? Some theorists emphasize nonrational forces and, indeed, view norm-based explanations of behavior as an alternative to rational choice explanations. As implied above, norms can be 'internalized' so that one feels guilt or anxiety from violating a norm, and pride or self-satisfaction from complying, even if no one else is aware of one's behavior. Elster (1989: pp. 97–151) emphasizes this emotional feature of norms. Internalization, however, seems a poor candidate for explaining norm origin. However it occurs, it seems more likely to follow than precede the approval of conformity and/or disapproval of nonconformity.

By contrast, rational choice theorists have offered two nonexclusive ways of explaining norm origin (see Pettit, 1990). They differ by whether one explains the behavioral regularity as arising before or after the pattern of approval and disapproval.

Deriving Norms from Regularities

The common way to derive a norm from interest is to explain first how a behavioral regularity arises and second how people come to approve conformity to the regularity and/or disapprove nonconformity. Game theory addresses the first issue – regularities – by its study of the mechanisms by which equilibrium is achieved. The (dis)approval patterns may subsequently arise for various reasons. Lewis (1969: pp. 97–100), for example, notes that conditions of a convention may easily give rise to approval of conformity. Even if conventions need not include his requirement that most individuals conditionally prefer that *others* conform (discussed above), it will often be the case that the condition holds. For example, one driving on the conventional side of the road desires that others follow the convention. In this circumstance, it is easy to imagine that self-interested individuals begin egoistically to *approve* of others conforming to the convention, and to resent nonconformity, given the danger they each face from nonconformity (see McAdams, 2010; Sugden, 1998b). Similarly, if contingent cooperation is a convention in an iterated prisoner's dilemma game, one will not only expect but also prefer that another engages in the conventional cooperation (see Bicchieri, 1993).

A consequence of this analysis is that a regularity might first be a convention, become both a convention and a norm, and end up as a norm only. Before the convention is a norm, people expect others to behave in conformity to the regularity, but do not yet disapprove of them for nonconformity. After the regularity is a norm for some time, it might cease to be arbitrary in the sense described above. The incentives created by the norm – particularly if it is ultimately internalized – might change the payoffs so that the only equilibrium outcome was conformity with the norm regularity.

Deriving Norms from Patterns of Approval and Disapproval

A less common means of deriving norms from interest is to explain first how a pattern of approval and disapproval arises and second how this produces a behavioral regularity. Various

mechanisms might produce the attitudinal pattern, the most obvious being the egoistic effect just discussed. Despite there being no regularity at this stage, it is easy to imagine that one person disapproves (approves) of another for conduct that harms (benefits) the former. Thus, prior to a regularity emerging, an individual may negatively regard a neighbor who makes loud and disturbing noises and positively regard those who clean up common areas. The same result could occur through moralistic rather than egoistic reasoning, if individuals each tend to disapprove (approve) of behavior they believe generally harms (benefits) others (see McAdams, 2010).

These patterns of (dis)approval can create behavioral patterns if individuals sufficiently value *esteem*, i.e., the approval and good opinion of others, as an end. In some circumstances, individuals may costlessly acquire information about the behavior of others, from which they reflexively form an esteem judgment of approval or disapproval. When the judgments are automatic, like being unthinkingly repulsed or attracted, the costs of making such judgments fail to prevent them. If so, the allocation of esteem creates an effective means of punishing or rewarding others. The desire for approval and the fear of disapproval may cause individuals to conform to a known pattern of esteem judgments (see Pettit, 1990; McAdams, 1997).

Elster (1989: p. 133) observes that *expressing* disapproval is always costly, as it takes time and risks the retaliation of the target. One might add that selectively expressing approval risks retaliation by those not approved. But these costs need not prevent esteem-judgments from operating as a sanction and producing a norm. First, judgments of disapproval need not be expressed to be perceived. Introspection may suffice: if *A* hates having his or her sleep disturbed by loud noise, *A* may simply guess that others will disapprove of him or her for waking them with a loud noise (see Pettit, 1990: p. 740). Second, there may be a cost to concealing one's esteem judgment that offsets any costs of expression. If *B* prefers to socialize only with people he or she esteems, then inviting to a social gathering people *B* does not esteem (or forgoing the gathering altogether) may be more costly than revealing the negative esteem judgments. *B* therefore rationally invites only those whom he or she esteems and, despite the costs, *indirectly* expresses negative judgments about others. As to both points, if individuals value esteem, they will seek evidence of how to get it, so even a trivial clue may cause people to form beliefs about the judgments being made. Once individuals perceive a pattern of approval and disapproval, they may gain (net) approval by directly expressing views consistent with the pattern.

Because individuals will tend to approve commonly beneficial behavior more than commonly harmful behavior, the discussion implies that norms derived from (dis)approval patterns will tend to be socially beneficial. A more detailed analysis would reveal several offsetting effects. However, norms are derived, they can cause harm in a variety of ways, particularly by allowing one group to benefit itself at the expense of another (see Hardin, 1995; Ullman-Margalit, 1977: pp. 134–197).

Conversation Analysis: Sociological

Jack Sidnell, University of Toronto, Toronto, ON, Canada

© 2015 Elsevier Ltd. All rights reserved.

Abstract

Conversation analysis (CA) is an approach to social interaction, which describes the stable structures and organizations of practice through which persons accomplish ordinary activities. Through a consideration of a single fragment of conversation, this article introduces some of the main methods, findings, and theoretical assumptions of CA focusing on the problems of turn-taking, action ascription, and repair.

Introduction

In the late 1950s and early 1960s, two great pioneers of the social and behavioral sciences – Erving Goffman and Harold Garfinkel – identified significant gaps in the study of human social life. Goffman, who had been trained by sociologists and anthropologists in the methods of ethnography, wrote of the 'neglected situation' – that substratum of copresent interaction that runs underneath and provides the foundation for all social life (see Goffman, 1964, 1967). Garfinkel, a student of Talcott Parsons who had been inspired by the writings of Alfred Schutz and other phenomenologists, noted that social order is the product of members' methodic procedures for producing and recognizing such order and thus that social life is fundamentally a matter of practical reasoning (see Garfinkel, 1967).

These insights provided the basis for an approach to social interaction known as conversation analysis (CA). The founders of CA, Harvey Sacks and Emanuel Schegloff, studied with Goffman at Berkeley and Sacks later worked with Garfinkel on a research project that examined calls to a suicide prevention hotline. Together, Sacks and Schegloff, along with Gail Jefferson, developed the methods of CA in such a way as to allow for the systematic study of the practical reasoning and endogenous methods that members of society use in order to engage in interaction with one another. Although CA is concerned with interaction in general, language figures centrally in human social life and as a result CA is often primarily concerned with talk-in-interaction.

In this article, the author briefly sketches some of the main ideas that guide current research in the field. A reader who wants to go further with study in this area is encouraged to seek out Sidnell and Stivers *The Handbook of Conversation Analysis* (Sidnell and Stivers, 2012) or Sidnell, *Conversation Analysis: An Introduction* (Sidnell, 2010).

Constructing Turns and Identifying Actions

In speaking, participants are doing things – they are, for example, greeting, requesting, inviting, offering, complaining, and so on. A basic task for the recipient of some bit of talk-in-interaction is, then, to identify what some speaker is doing – what action they mean to accomplish – in speaking in the way that they do. For instance, if one person says to another, "How great is that?" are they requesting information or complimenting the recipient? (See Sidnell, forthcoming.) Or, if they say, "it's raining again" are they suggesting that the recipient should take an umbrella if going for a walk, complaining about the state of the weather, or requesting that someone bring in the laundry? (The issues here are actually much more complex than is suggested by this example and well beyond the scope of the present article. For a more developed argument about the ontology of action in interaction, see Sidnell and Enfield, forthcoming.) Even simple examples such as these make it clear that, in interaction, participants engage in complex inferential process in order to get from what is said to what is meant.

This, then, is just the kind of practical reasoning to which Garfinkel drew attention in his studies. But an arguably more basic aspect of practical reasoning is involved in identifying the particular bits of talk – the utterances – to which actions are linked, whether by speakers in producing them or recipients in recognizing them, in the first place. That is, a recipient in interaction must determine where a given utterance begins and, perhaps more problematically, where it ends. In a groundbreaking study, Sacks et al. (1974) described a 'simplest systematics' that would allow not only for the identification of utterances – or what they refer to as 'turns-at-talk' – but also for the orderly transition between them. An important feature of the system is that it operates independently of whatever particular action(s) the participants are engaged in – that is, whether the participants are greeting, requesting, inviting, offering, complaining, or whatever else they do so in turns-at-talk that have beginnings, middles and possible completions. For this reason, Sacks et al. (1974) argue that the turn-taking system for conversation is 'context independent' since it operates in the same way regardless of what actions are being performed, how the participants are related to one another, where the interaction takes place, and so on. At the same time, they go on to suggest that it is capable of extreme context sensitivity since the details of any particular turn-at-talk reflect in a multitude of ways just these and other contextual parameters. A basic but crucial idea is, then, that there are different levels or orders of organization. There is, for instance, one order pertaining to the organization of talk as action. There is another order related to the organization of talk as turns or, put another way, opportunities to participate in interaction and so on.

Let us consider a single example now for what it can reveal about members' methods for identifying utterances (turns at talk) and actions. The following is an utterance drawn from

a telephone conversation between two friends, Debbie (the speaker) and Shelley (the recipient).

"It's not 'cause Mark's not going."

Here the utterance is written out using (broadly) standard English orthography. We can see that this is a declaratively formatted sentence in which Debbie is speaking about the causal relationship between two events. Specifically 'it' (event 1) is apparently not caused by Mark not going (event 2). This describes (however vaguely) the propositional content of Debbie's utterance. Now, if we are to understand how it is that Shelly recognizes this as a turn-at-talk and as an action-in-interaction we will need to consider some of the ways in which it is produced (its composition) and the particular place in an unfolding conversation that it occurs (its position). Here then is the same utterance shown as part of the conversation in which it was produced.

Examples are presented using the transcription conventions originally developed by Gail Jefferson. For present purposes, the most important symbols are the period ('.'), which indicates falling and final intonation, the question mark ('?') indicating rising intonation, and brackets ('[' and ']') marking the onset and resolution of overlapping talk between two speakers. Equal signs, which come in pairs – one at the end of a line and another at the start of the next line or one shortly thereafter – are used to indicate that the second line followed the first with no discernable silence between them, that is, it was 'latched' to it. Numbers in parentheses (e.g., (0.5)) indicate silence, represented in tenths of a second. Finally, colons are used to indicate prolongation or stretching of the sound preceding them, the more colons, the longer the stretching. (For an explanation of other symbols, see Sacks et al., 1974; Sidnell, 2010.)

1. Debbie and Shelley

```
12  Shelley:  distric attorneys office.
13   Debbie:  Shelley:¿
14  Shelley:  Debbie¿=
15   Debbie:  ↑what is tha dea::l.
16  Shelley:  whadayou ↑mean.
17   Debbie:  yuh not gonna go:.?
18            (0.2)
19  Shelley:  well -hh now: my boss wants
20            me to go: an: uhm finish this
21            >stupid< trial thing,u[hm
22   Debbie:->                      [<its not
23            causeuh:m (0.5) Mark's not going.
24  Shelley:  no- well that wuz initially and
25            then I'm like no: I'll just go
26            and then uhm yaknow this- this
27            tow bandit (·) thing that I have,
28            that were doing, [he w]a:nts
```

We can now see that the utterance in question is actually produced with significant delay between 'cause' and 'Mark's,' This delay is first manifested as the vocalization 'uhm' and then as silence. What Shelley initially hears, then, is something like:

"It's not cause uhm"

Consider this in relation to the question of how it is that participants are able to recognize turns at talk in conversation. One possible solution to that problem might be that they simply wait until the speaker is finished speaking. But if that were all there was to it, Shelley might have heard "It's not cause uhm" as Debbie's complete utterance. This silence is pretty substantial in conversational terms and thus if Shelly were simply waiting for a break in Debbie's talk as an indication that she was finished speaking she might have identified this as the completion of the turn. But of course it is not – we know that and Shelley apparently does too. The question is how do we know that? Perhaps the 'uhm' tells Shelley that, although Debbie will pause the production of her talk, she has not actually completed the turn. There is something to that suggestion and we will, below, consider in a bit more detail just what 'uhm' is doing here. But for now, let us note that it cannot be the whole story. After all, in the prior talk (lines 19–20) Shelley was herself in the course of producing an 'uhm' at just the point when Debbie began speaking. So 'uhm' cannot be an unambiguous signal that there is more to come, or at least, if it is, it is not one that prevents a next speaker from starting their own turn. Rather, there must be something about the talk here (perhaps in combination with the 'uhm') that tells Shelley that Debbie has not completed her turn when she says, "It's not cause uhm." We as observers and as competent conversationalists can hear, I think, that this is not complete – it is not a complete sentence and it is not a complete turn in this context. Specifying how we are able to hear that it is not complete was one of the goals of the paper by Sacks et al. (1974) on turn-taking.

Essentially, these authors proposed that turns-at-talk are composed of what they called 'turn constructional units' or TCUs and that a current speaker is initially entitled (and obligated) to produce one such unit. They further suggested that, in English, there are four types of TCUs and that these can be described in grammatical terms as lexical, phrasal, clausal, and sentential units. It is not that any such unit will work in any context (obviously this is not true). Rather, the proposal appears to be that speakers select some particular unit type and that recipients listen to the talk in order to locate such units (using the analogy of linguistics and computing we could say that they 'parse' the talk into such units). According to these authors, these units have a feature of projectability that essentially means that, having heard the start of a unit, a recipient can anticipate – project – what it will take to reach a first point of possible completion. Participants in interaction apparently do this more or less automatically and, although they are not infallible – sometimes misprojecting the completion of a unit – the degree of accuracy and precision they are able to achieve in ordinary conversation is remarkable. Any strip of conversation will reveal split-second timing of transitions between speakers, suggesting that recipients are able to accurately predict where a unit will reach completion and are prepared to begin their own talk at just such points. Thus, if we consider the first few lines of the conversation between Debbie and Shelley, we can see that the transitions between speakers are achieved with minimal gap and overlap:

2. Debbie and Shelley

```
12  Shelley:  distric attorneys office.
13   Debbie:  Shelley:¿
14  Shelley:  Debbie¿=
15   Debbie:  ↑what is tha dea::l.
16  Shelley:  whadayou ↑mean.
17   Debbie:  yuh not gonna go:.?
```

We can now perhaps understand a bit better what is happening in lines 22 and 23. Here, Shelley can presumably hear from "it's not cause" that Debbie's turn is in progress and that it has not reached completion. Thus, the silence that emerges between 'uhm' and 'Mark's' is not a place for Shelley to take a turn. Rather, something else is presumably happening here, just what we will consider below.

We have briefly considered how it is that Shelley might be able to identify the boundaries of the utterance here – how she might, that is, recognize in this talk a TCU and how that has implications for the timing of her own response. Let us now consider what is involved in recognizing the action here. We can start by noting as we did earlier that this is a declaratively formatted sentence in which Debbie is speaking about the causal relationship between two events. Looking back a bit, we can see that Debbie and Shelley are talking about why Shelley is not going (specifically not going on a trip that the two had planned as is revealed later on in the conversation). So Debbie offers "Mark's not going" as not the reason Shelley is not going. If the logic of this seems somewhat complex, even opaque, that is probably relevant to how it is understood by Shelley and thus how she recognizes what action is being done. But let us start with some rather more simple observations.

First, we can see that, although the sentence is declaratively formatted, with it, Debbie appears to be asking a question rather than making an assertion. In order to understand how it does this, we have to think about this utterance in relation to a presumed distribution of knowledge between the participants. So here Debbie is talking about Shelley's reasons for not going on a trip. Shelley's reasons for not going on the trip (her reasons for anything) are something that she knows about better than Debbie, indeed, better than anyone. Her reasons for doing things fall, we can say, squarely within her 'domain of knowledge.' Thus, when Debbie says this, she is not heard as asserting but rather as questioning or requesting confirmation. So we can see from this example that one of the basic issues confronting the recipient of an utterance such as this is whether the action being done is asserting or questioning, telling or asking. And you can see from the examples below that when a speaker uses a declaratively formatted utterance to talk about something that the recipient knows better than does the speaker, the speaker is routinely and unproblematically heard as asking rather than telling (see Heritage, 2012).

3. Coffee chat – 11, 8:10

```
25 Rich:    You been in Colvina:,
26          (0.6)
27 Betty:   Ye:ahs, that's right. That's right.
```

4. Coffee chat – 18, 12:25

```
01 Tom:     =Oh yer [on the first floor again?
02 Hank:            [Yeh.
03          YEAH.
```

5. TC_II_(b):_#28

```
16 Bush:    He's down in Mexico or some'in?,
17 Pyatt:   I don't know,
```

6. SBL-1-10

```
10 Rose:    Ah'it left'er (0.4) quite
11          permanently damaged °I suppose°
12 Bea:     Uh:pparently,
```

In examples 3 and 4, the speaker is talking about the recipient. "You been in Colvina" and "You're on the first floor again?" are heard as questions that request confirmation and in both cases confirmation is what they get in the next turn. In examples 5 and 6, the speaker is talking about a third party (neither speaker nor recipient) but, again in both cases, the declaratively formatted utterance is treated as a question by the response. In example 5, the recipient, Pyatt, responds with "I don't know" thereby accounting for not answering the question as put (i.e., he cannot answer because he does not have adequate knowledge to do so). In example 6, two nurses are talking about an accident suffered by a patient. Bea has more recent and detailed knowledge here and when Rose says "it left her quite permanently damaged" she calls attention to her lack of information by appending "I suppose" (which marks what she has said here as an inference). Bea then tentatively confirms what Rose has suggested with 'apparently.'

So we can see a robust phenomenon at work here: where the speaker's declaratively formatted utterance pertains to matters about which the recipient knows better (or about which the recipient has greater 'epistemic' rights to talk about), that utterance is heard as a question, specifically a request for confirmation. Labov (1970) described this in terms of A events, B events, and AB events, where A events are those known by A, B events those known by B, and AB events those known by both. He writes, "If A makes a statement about a B-event, it is heard as a request for confirmation."

The discussion so far has drawn on some of the basic methods of CA. Let us try to make these explicit. Notice from the outset that we are concerned with members' methods of practical reasoning – here, practical reasoning about interaction and specifically what a given utterance is doing. In order to study this, we need some access if not to their methods directly then to the results of those methods. And this is how we use subsequent talk. That is, if we want to see how an utterance in any of these examples was understood – whether in terms of what action it was doing, or in terms of where it reached completion – we can examine the response that it elicits. Participants try to make their contributions fitted to what has come before – and most importantly immediately before – and thus any contribution will, at least tacitly, convey an understanding of prior talk. In the case of a question and its response, this is particularly obvious. Thus, when Betty says "Ye:ahs, that's right. that's right," she can be seen to be answering a (yes–no) question. This response thus reveals to both us and to the other participants how the prior talk was understood – it reveals, that is, an analysis of that talk. It provides us, analysts, with data-internal evidence to support the argument that these utterances are hearable as questions despite the fact that they are formatted as declaratives.

Now we can take this a bit further and doing so will reveal something crucially important about the organization of action. So if we go back to the example we began with, we can

see that Shelley does answer the question but that is not all she does:

7. Debbie and Shelley

```
24  Shelley:  no- well that wuz initially and
25            then I'm like no: I'll just go
26            and then uhm yaknow this- this
27            tow bandit (·) thing that I have,
28            that were doing, [he w]a:nts
```

With 'no,' Shelley has apparently answered the question by confirming what Debbie has proposed (the reason she is not going is not because Mark is not going). But notice that before this 'no' is even brought to completion, it is cut off and Shelley continues. In what she says after the 'no,' she goes beyond simply answering the question. Here, she tells Debbie in some detail about her reasons for not going. According to Shelley, the fact that Mark was not going did initially influence her decision. However, according to what she says here, although she decided not to go at first, she then changed her mind ("I'll just go"). It was only after that initial decision had been made and changed that she again changed her mind because of something happening at work. So here Shelley admits, in response to Debbie's question, that, yes, Mark's not going did affect her own decision but goes on to propose that ultimately this was not the reason why she decided not to go.

The point here then is that there are other layers of action besides simply 'answering.' Here, for instance, Shelley can appropriately be described as first admitting and subsequently explaining or perhaps excusing herself. She excuses herself by offering an account (or reason) for her decision in which she is characterized as not-at-fault simply because she had no choice. Rather, her boss required that she work that weekend thereby making it impossible for her to go on the trip she had planned with Debbie.

An admission or an excuse is a kind of responsive action that is produced in response to a particular kind of initiating action. If, as we have proposed, responses reveal their speaker's analysis or understanding of the turn to which they respond, Shelley must have heard "it's not cause Mark's not going" as an accusation or complaint or some other such action worthy of an excuse in response.

8. Debbie and Shelly

```
12  Shelley:  distric attorneys office.
13   Debbie:  Shelley:¿
14  Shelley:  Debbie¿=
15   Debbie:  ↑what is tha dea::l.
16  Shelley:  whadayou ↑mean.
17   Debbie:  yuh not gonna go::?
18            (0.2)
19  Shelley:  well -hh now: my boss wants
20            me to go: an: uhm finish this
21            >stupid< trial thing,u[hm
22   Debbie:->                      [<its not
23            causeuh:m (0.5) Mark's not going.
24  Shelley:  no- well that wuz initially and
25            then I'm like no: I'll just go
26            and then uhm yaknow this- this
27            tow bandit (·) thing that I have,
28            that were doing, [he w]a:nts
```

In our discussion of how it is that participants in interaction come to recognize a particular utterance as some specific action, we have focused primarily on the composition of the talk. For instance, we noted that declaratively formatted utterances that pertain to matters within the recipient's domain of knowledge (or epistemic domain) are routinely heard as questions. In order to understand how Shelley can find in "It's not cause Mark's not going" an accusation or complaint, we need to consider not only the composition of the turn but also its position within an unfolding course of talk and sequence of turns.

Notice then that this turn comes very near the beginning of the conversation between Debbie and Shelley. Debbie has called Shelley at work and after speaking to a receptionist has reached her at line 12 with Shelley self-identifying with "District attorney's office." With this, Shelley shows she is expecting a work-related call and is prepared to interact according to her work-related identity. However, the turns that follow – a reciprocal exchange of names – immediately resets the call as conversational rather than institutional. At line 15, the conversationalists have reached anchor position – a place for the caller to announce or to otherwise indicate what it is she is calling about. Debbie does this in a very particular way. With "what is the deal," Debbie is clearly not only asking a question but also more than that. The positioning is abrupt and the question itself obviously presumes that Shelley knows already what it is Debbie might be calling about. More specifically by referring to 'the deal,' Debbie suggests that there is a known-in-common matter that might constitute 'a deal,' which is to say a problem.

After Shelley initiates repair with "what do you mean?," thereby suggesting she does not know what it is Debbie is talking about, Debbie asks a revised version of the question, "you're not going to go?" Compared to an interrogative format such as "Are you going to go?," this one suggests that Debbie is relatively certain of the answer. With "you're not going to go?," Debbie reveals the problem that she indexed with 'the deal.' Specifically, Debbie shows that she already knows Shelley plans not to go on the trip. Now, in response to the question "you're not going to go?," Shelley does not answer specifically with yes or no, but rather provides an account for why she will not go. This account assigns responsibility for Shelley's decision to her boss. Notice also that Shelley refers to the work-related matter as this "stupid trial thing." In this way, Shelly assesses the work-related matter negatively ('stupid' and 'thing') and characterizes it as an inconvenience to her.

It is in this context that Debbie produces the question, "it's not 'cause Mark's not going?" We can see quite plainly that Debbie's question here asks about something that Shelley's already talked about. Specifically, Debbie suggests an alternate and competing explanation for why it is that Shelley is not going to go. This explanation, the one that she offers, assigns responsibility for the decision squarely to Shelley.

So we can see that Shelley uses both the composition and position of this utterance to find in it complaint or even accusation. It is to this action that she responds with an excuse. So importantly, in interaction, actions are multiple and layered. A single utterance can be understood in a number of different ways. Here Debbie's question "it's not because Mark's not going?" is a question, a complaint, and

perhaps also hearable as an accusation that Shelley is not being completely honest in the immediately prior talk and so on.

In this section, we have also seen something of the method of CA. Specifically, we have seen that if we want to propose that a given utterance functions as a question we must look to see how a recipient responded to it. There is obviously more to it than that but this is nevertheless crucial. We can use the participants' own conduct to ground an analysis of how they understood prior talk. Thus, the evidence we use in CA is internal to the data itself and is evidence that the participants themselves have access to. Now, of course, as analysts we draw on evidence afforded by multiple occasions involving different participants in order to see how the structures of conversation are generic, cohort independent, and useable in different contexts. But our first line of argument draws upon the data internal evidence that participants themselves produce in the course of face-to-face interaction (for a more detailed account of the method, see Sidnell, 2012).

Word Searching and Repair

So far, we have seen that the utterance "it's not because Mark's not going" can be seen as a question and as a possible complaint or even accusation. If we now look at the utterance in greater detail, we will see that it can also be understood in a quite different way.

<its not causeuh:m (0.5) Mark's not going.

As we have already noted, Debbie produces this utterance with a substantial pause between 'causeuh:m' and 'Mark's.' What might she be doing here? Consider the following examples:

9. G 86:490

```
19 Mike:            [This guy's name was Blake.
20        (0.4) he was in the movie
21         uh:, (0.6) In Cold Blood
```

10. Auto discussion P.11

```
28  CUR:  Keegan usetuh race uhr uh- er ih
29        was um, (0.4) usetuh run um,
30        (1.0)
31  CUR:  Oh::shit.
32        (0.4)
33  CUR:  Uhm,
34        (0.4)
35  CUR:  car.
36  MIK:  Three en[n a[quarter?
37  CUR:          [Thr[ee enna quarter.
```

11. Berkeley (1:19)

```
18  RIT:   it was ca:lled uh::(hh)
19         (.) the Wayside Inn.
20         (0.9)
21  LES:   the Wayside Inn¿hh=
22  RIT:   =yeah.
```

Across these examples we see a recurrent pattern. This involves the speaker producing a turn at talk up to the point at which they are going to say a name. In each case, the speaker encounters trouble remembering the name and engages in a search for it. So in example 9 Mike says, "he was in the movie" and here begins a search for the name "in cold blood," In 10, Curt is looking for the name 'three and a quarter.' He first encounters trouble at line 28. The trouble continues until Mike provides the name at line 37. And in 11, Rita apparently cannot remember the name 'the Wayside Inn.' Although there are significant differences across these examples, there are also similarities. Specifically in each case, we see a speaker marking the onset of trouble with 'uh:' (9), 'uhr' (10), 'uh::' (11) then delaying, then either producing the name or, as in 10, extending the search by various means until a point at which one of the other participants produces the name. (In these examples, it is a name that causes the problem but this is by no means always the case.)

A basic assumption that participants in interaction appear to make is that next items (e.g., a sound, a word, a sentence, and so on) will forward the action initiated by previous items. In the cases we are examining here, however, the progress of the talk is suspended such that that assumption will not hold. Word searches then are a subtype of repair (see Schegloff et al., 1977; Goodwin and Goodwin, 1986). More specifically, they are a subtype of self-initiated repair. Humans are obviously imperfect. As such, in interaction they encounter various kinds of trouble. Repair refers to an organized set of practices by which participants may identify, locate, and fix those troubles. Other subtypes of self-initiated repair deal with other types of trouble. For instance, often a speaker will say one thing and subsequently replace it with something else. So in the extract from Debbie and Shelley below we see Shelley replacing 'that I have' with 'that were doing:'

```
"this tow bandit (·) thing that I have,
that were doing,"
```

And in the extract from example 10 below, we see Curt replace 'used to race' with 'used to run:'

```
"Keegan usetuh race uhr uh- er ih was um,
(0.4) usetuh ru[n"
```

Such cases of self-initiated self-repair are extremely common in ordinary conversation and other forms of talk (see Hayashi et al., 2013).

Episodes of repair are composed of parts (Schegloff et al., 1977). A repair initiation marks a "possible disjunction with the immediately preceding talk" while a repair outcome results either in a "solution or abandonment of the problem" (Schegloff, 2000: p. 207). The particular segment of talk to which the repair is addressed is called the trouble source. Repair can be initiated either by the speaker of the repairable item or by some other participant. With these distinctions, we can describe any instance of repair in terms of who does what and where. Thus, we have already proposed that the cases above are instances of self-initiated repair. We can now further specify that they are instances of same turn, self-initiated, self-repair. We can compare such examples of same turn, self-initiated, self-repair with examples such as that from Debbie and Shelley below in

which repair is other-initiated (with "whadayou mean.") in the next term and completed in the turn after that.

12. Debbie and Shelly

```
15   Debbie:  ↑what is tha dea::l.
16  Shelley:  whadayou ↑mean.
17   Debbie:  yuh not gonna go:.?
```

Here then, the trouble source is the question "what is the deal." The repair initiation takes the form "what do you mean?" in the next turn and the repair is provided by the speaker of the trouble source, Debbie, with "yuh not gonna go?"

In a classic paper, Schegloff et al. (1977) proposed that all these forms of repair are organized into a single system. That system has a bias, according to these authors, such that self-correction or repair is preferred to any other kind. 'Preference' here refers to a bias in the organization of interaction evidenced by the fact that other-correction and even other-initiation tends to be delayed, hedged, modulated, and only done after the speaker of the trouble source has had an opportunity to repair a problem in their own talk.

Conclusion

In this brief article, the author has attempted to describe some of the main methods and findings of the field of CA. Focusing on a single example, the conversation between Debbie and Shelley, but simultaneously looking across various occasions of interaction, we have seen some of the more robust, stable practices and structures of social interaction such as those involved in taking turns, recognizing actions, and repairing troubles. These practices and structures are the very phenomena that Goffman proposed as an object of sociological study and underlying them are those modes of practical reasoning to which Garfinkel was at pains to our draw attention.

Cooperation and Competition

Abstract

The four major theoretical orientations to cooperation and competition are cognitive development, behavioral learning, social cognitive, and social interdependence. Of the four, social interdependence theory has generated the most research and applications. The basic premise of social interdependence theory is that the type of interdependence structured in a situation determines how individuals interact with each other which, in turn, determines outcomes. The hundreds of studies that have been conducted indicate that cooperation, compared with competitive and individualistic efforts, tends to result in higher achievement and productivity, more positive interpersonal relationships, and greater psychological health.

Introduction

During the twentieth century, there have been a series of social forces that have highlighted the importance of cooperation and competition and often created a creative tension between them. In the early 1900s, the advent of the industrial revolution and the ending of colonialism focused attention on the importance of well functioning, cooperative groups. But it also promoted the belief that competition was the secret to increase economic success. During the 1920s and 1930s, with the worldwide depression and the rise of dictatorship in Europe, the importance of cooperation was again highlighted. But at the same time, business and industry groups, such as the Liberty League in the USA, increased their emphasis on competition in business and industry, education, and other areas of life. In the aftermath of the Second World War, there was great concern about the future of democracy and the need to better understand how democratic organizations could be made to function more effectively. The health of a democratic society, it was thought, depended on the effectiveness of its component groups. Strengthening the quality of cooperation in the family, the community, and the multitude of groups within society was viewed as the primary means of ensuring the vitality of democracy and the successful solving of the existing social problems. At the same time, the rise of social Darwinism promoted competition as the natural order of life. In the early 1960s, anthropology and ethnology proposed that competition over weapon systems sparked human evolution. The civil rights movement and concerns about the possibility of nuclear war, on the other hand, created great interest in cooperation among diverse individuals. The tension between and interest in cooperation and competition sparked discussions in three major theoretical orientations: cognitive developmental, behavioral, and social interdependence.

Cognitive Developmental Theory

The 'cognitive developmental perspective' is largely based on the theories of Piaget (1950), Vygotsky (1978), cognitive science, and academic controversy (Johnson and Johnson, 2007, 2009a). To Jean Piaget (1950), cooperation is the striving to attain common goals while coordinating one's own feelings and perspective with a consciousness of others' feelings and perspective. From Piaget and related theories comes the premise that when individuals cooperate on the environment, sociocognitive conflict occurs that creates cognitive disequilibrium, which in turn stimulates perspective-taking ability and cognitive development. Cooperation in the Piagetian tradition is aimed at accelerating a person's intellectual development by forcing him or her to reach consensus with others who hold opposing points of view about the answer to the problem. Lev Semenovich Vygotsky (1978) and related social constructionist theorists claim that our distinctively human mental functions and accomplishments have their origins in our social relationships. Mental functioning is the internalized and transformed version of the accomplishments of a group. Knowledge is social, constructed from cooperative efforts to learn, understand, and solve problems. A central concept is the 'zone of proximal development,' which is the zone between what a person can do on his or her own and what the person can achieve while working under the guidance of older individuals or in collaboration with more capable peers. Unless persons work cooperatively, they will not grow intellectually and the time in which persons work alone should therefore be minimized.

The central aspect of cooperation according to cognitive-developmental theory is conflict among ideas or controversy. 'Constructive controversy theory' (Johnson and Johnson, 2007, 2009a) posits that being confronted with opposing points of view creates disequilibrium, uncertainty, or conceptual conflict, which creates a search for more information and a reconceptualization of the issue, which results in a more refined and thoughtful conclusion. The key steps of constructive controversy are organizing what is known into a position, advocating that position to someone who is advocating an opposing position, attempting to refute the opposing position while rebutting the attacks on one's own position, reversing perspectives so that the issue may be seen from both points of view simultaneously, and creating a synthesis to which all sides can agree.

Behavioral Learning Theory

The 'behavioral learning perspective' assumes that individuals will work hard on those tasks, for which they secure a reward

of some sort and will fail to work on tasks that yield no reward or yield punishment (Bandura, 1977; Skinner, 1968). Cooperative efforts are designed to provide incentives for the members of the group to participate in a group effort since it is assumed that individuals will not intrinsically help their classmates or work toward a common goal. Skinner focused on group contingencies, Bandura focused on imitation, and Homans as well as Thibaut and Kelley focused on the balance of rewards and costs in social exchange among interdependent individuals.

The most developed behavioral theory of cooperation and competition was developed by Kelley and Thibaut (1978). They assumed that individuals act to maximize their self-interests by behaving in ways to maximize their rewards and minimize their punishments or costs. 'Rewards' are defined as positive interaction experiences that yield outcomes that promote physical or emotional well being, self-esteem, or personal growth such as enjoyment, fulfillment, or contentment. 'Costs' are defined as negative interaction experiences that yield physical or emotional pain or failure. People attempt to recreate experienced interactions that yield pleasure and avoid interactions that yield pain. 'Cooperation' is thus defined as acting in ways perceived to maximize joint rewards and minimize joint costs, 'competition' as acting in ways to maximize one's own rewards and minimize one's own costs relative to others, and 'individualistic efforts' as acting in ways to maximize one's own rewards and minimize one's own costs with little or no regard of the outcome for others. In evaluating outcomes, individuals have a 'comparison level' about what constitutes an acceptable outcome and a 'comparison level for alternatives' about how those outcomes compare to other possible outcomes. Cooperation tends to occur when outcomes are correspondent and competition tends to occur when outcomes are noncorrespondent.

Social Cognitive Theory

Social cognitive theory views cooperation as collective agency (Bandura, 2000), the shared belief in the collective power to produce desired results. In collective agency, individuals have to work together to secure what they cannot accomplish on their own. Perceived collective efficacy influences the goals the group strives to achieve, how well they use their resources, how much effort they put into their group endeavor, their staying power when collective efforts fail to produce quick results or meet forcible opposition, and their vulnerability to the discouragement that can beset people taking on tough problems.

From the social cognitive perspective, cooperation involves modeling, coaching, and scaffolding (i.e., conceptual frameworks that provide understanding of what is being learned) (Lave and Wenger, 1991). Ideally, the learner will cognitively rehearse and restructure information for it to be retained in memory and incorporated into existing cognitive structures (Wittrock, 1990). An effective way of doing so is explaining the material being learned to a collaborator. Finally, social cognitive theory places cooperation at the center of a community of practice, a group of people who share a craft or a profession.

Social Interdependence Theory

The roots of social interdependence theory lie in the early 1900s when Kurt Koffka (one of the founders of the Gestalt School of Psychology) proposed that groups were dynamic wholes, in which the interdependence among members could vary. In the 1920s and 1930s, Kurt Lewin refined Koffka's notion, proposing that the essence of a group is the interdependence among members created by common goals, and that goal interdependence results in the group being a 'dynamic whole,' so that a change in the state of any member or subgroup changes the state of any other member or subgroup. Continuing Lewin's work, in 1949, Morton Deutsch (1949, 1962) formulated social interdependence theory.

'Social interdependence' exists when individuals share common goals and each individual's outcomes are affected by the actions of the others (Deutsch, 1962; Johnson and Johnson, 1989). It may be differentiated from social dependence (i.e., the outcomes of one person are affected by the actions of a second person but not vice versa) and 'social independence' (i.e., individuals' outcomes are unaffected by each other's actions). There are two types of social interdependence: positive (cooperative) and negative (competitive).

'Cooperation' exists when individuals work together to accomplish shared goals (Johnson and Johnson, 2009b). When a situation is cooperatively structured, individuals' goal achievements are positively correlated; individuals perceive that they can reach their goals if, and only if, the others in the group also reach their goals (Deutsch, 1962; Johnson and Johnson, 1989). Thus, individuals seek outcomes that are beneficial to all those with whom they are cooperatively linked. 'Competition' exists when individuals work against each other to achieve a goal that only one or a few can attain (Johnson and Johnson, 2009b). When a situation is structured competitively, individuals' goal achievements are negatively correlated; each individual perceives that when one person achieves his or her goal, all others with whom he or she is competitively linked fail to achieve their goals (Deutsch, 1962; Johnson and Johnson, 1989). Thus, individuals seek an outcome that is personally beneficial but detrimental to all others in the situation. 'Individualistic efforts' exist when individuals work by themselves to accomplish goals unrelated to the goals of others (Johnson and Johnson, 2009b). When a situation is structured individualistically, there is no correlation among participants' goal attainments. Each individual perceives that he or she can reach his or her goal regardless of whether other individuals attain or do not attain their goals (Deutsch, 1962, Johnson and Johnson, 1989). Thus, individuals seek an outcome that is personally beneficial without concern for the outcomes of others.

Of the theories of cooperation discussed, social interdependence theory is by far the most important in terms of research generated and practice applications derived. It will, therefore, be discussed in some depth.

Interaction Patterns

The basic premise of social interdependence theory is that the type of interdependence structured in a situation determines how individuals interact with each other which, in turn,

determines outcomes (Deutsch, 1949, 1962; Johnson and Johnson, 1989, 2009b). Positive interdependence tends to result in promotive interaction; negative interdependence tends to result in opposition or contrient interaction, and no interdependence results in an absence of interaction. 'Promotive interaction' occurs when members help and assist each other, exchange resources, give and receive feedback, challenge each other's reasoning, and encourage increased effort. Group members focus on maximizing the success of their groupmates as well as their own. 'Oppositional interaction' occurs as individuals discourage and obstruct each other's efforts to achieve. Individuals focus both on increasing their own success and on preventing anyone else from being more successful than they are. 'No interaction' exists when individuals work independently without any interaction or interchange with each other. Individuals only focus on increasing their own success and ignore, as irrelevant, the efforts of others. The relationship between the type of social interdependence and the interaction pattern it elicits is assumed to be bidirectional. Each may cause the other. Each of these interaction patterns, furthermore, creates different outcomes.

Psychological States

Deutsch (1949, 1962) noted that depending on whether individuals promote or obstruct each other's goal accomplishments, there is 'substitutability' (i.e., the actions of one person substitute for the actions of another), 'cathexis' (i.e., the investment of psychological energy in objects and events outside of oneself), and 'inducibility' (i.e., openness to influence). Essentially, in cooperative situations, the actions of participants substitute for each other, participants positively cathect to each other's effective actions, and there is high inducibility among participants. In competitive situations, the actions of participants do not substitute for each other, participants negatively cathect to each other's effective actions, and inducibility is low. When there is no interaction, there is no substitutability, cathexis, or inducibility.

Outcomes

The investigation of cooperation and competition is the longest standing research tradition within American social psychology. From 1898 to 2014, researchers have conducted over 1200 studies from which effect sizes can be computed on social interdependence and hundreds of more studies that do not provide enough information to compute effect sizes (Johnson and Johnson, 1989, 2009b). Since research participants have varied widely as to gender, economic class, age, and cultural background, since a wide variety of research tasks and measures of the dependent variables have been used, and since the research has been conducted by many different researchers with markedly different orientations working in different settings and in different decades, the overall body of research on social interdependence has considerable generalizability. The numerous outcomes studied may be subsumed within three broad categories (Johnson and Johnson, 1989, 2009b): (1) effort to achieve; (2) positive relationships; and (3) psychological health. In terms of productivity and achievement, a meta-analysis of all available studies (Johnson and Johnson, 1989) found that the average person in a cooperative situation performed at about two-third a standard deviation above the average person learning within a competitive (effect size = 0.67) or individualistic situation (effect size = 0.64). These results held constant when group measures of productivity were included as well as individual measures, for short-term as well as long-term studies, and when symbolic as well as tangible rewards were used.

In terms of quality of relationships, cooperative efforts, compared with competitive and individualistic experiences, promoted considerable more liking among individuals (effect sizes = 0.66 and 0.62, respectively) even when individuals were from different ethnic and historical backgrounds, or were handicapped (Johnson and Johnson, 1989). In addition, cooperative experience promoted greater task-oriented and personal social support than did competitive (effect size = 0.62) or individualistic (effect size = 0.70) efforts.

Finally, the research indicates that (1) working cooperatively with peers and valuing cooperation result in greater psychological health than does competing with peers or working independently and (2) cooperative attitudes are highly correlated with a wide variety of indices of psychological health (Johnson and Johnson, 1989). Competitiveness was in some cases positively and in some cases negatively related to psychological health, and individualistic attitudes were negatively related to a wide variety of indices of psychological health. In addition, cooperative experiences promoted higher self-esteem than did competitive (effect size = 0.58) or individualistic (effect-size = 0.44) experiences. Cooperative experiences also tended to increase perspective-taking ability while competitive and individualistic experiences tended to promote egocentrism (being unaware of other perspectives other than your own) (effect sizes of 0.61 and 0.44, respectively). It is through cooperative efforts that many of the attitudes and values essential to psychological health (such as self-efficacy) are learned and adopted. Social skills and competencies tend to increase more within cooperative than in competitive or individualistic situations (Johnson and Johnson, 1989, 2009b). Thus, there seems to be a strong relationship between cooperativeness and psychological health, a mixed relationship between competitiveness and psychological health, and a strong relationship between an individualism and psychological pathology.

These outcomes of cooperative efforts (effort to achieve, quality of relationships, and psychological health) form a gestalt where each influences the others and they are therefore likely to be found together.

Two meta-analyses were conducted to determine the impact of quality of interpersonal relationships and motivation on achievement. Over eight decades of research on over 17 000 early adolescents from 11 countries found that higher achievement and more positive peer relationships were associated with cooperative rather than competitive or individualistic goal structures (Roseth et al., 2008). More specifically, 33% of the variation in achievement was accounted for by positive peer relationships (40% when the low-quality studies were removed). Johnson et al. (2014) found that the results of 629 independent studies representing 26 different countries indicated that cooperative

goal structures resulted in greater achievement and motivation than did competitive or individualistic goal structures. Compared to competitive and individualistic goal structures, the relative effects of cooperative goal structures on motivation and achievement were positively correlated, accounting for 14% (24% when low-quality studies were removed) of the variance in achievement (and vice versa).

A concern in schools is bullying. Choi et al. (2011) examined the relationship between (1) cooperative, competitive, and individualistic predispositions and experiences and (2) harm-intended aggression (i.e., bullying) and prosocial behavior. The more cooperative the classroom, the greater the students' cooperativeness. Cooperativeness predicted prosocial behaviors and the absence of harm-intended aggression, while competitiveness predicted harm-intended aggression. In other words, engaging in competition and being competitive tends to increase bullying and engaging in cooperative experiences and being cooperative tends to decrease bullying and increase prosocial behavior.

Basic Elements

In order for cooperative efforts to be effective, five elements must be structured in the situation: positive interdependence, individual accountability, promotive interaction, social skills, and group processing. 'Positive interdependence' exists when one perceives that one is linked with others in a way, so that one cannot succeed unless they do (and vice versa) and that one must coordinate one's efforts with the efforts of others to complete a task (Deutsch, 1962; Johnson and Johnson, 1989). Cooperative efforts may be built on outcome interdependence (i.e., goals and rewards), means interdependence (i.e., resource, role, and task interdependence or group members being tied together by complementary resources, interlocking roles, or a division of labor), and environmental interdependence (i.e., interdependence based on shared space, proximity, and boundaries) (Johnson and Johnson, 1989, 1999, 2009b).

'Individual accountability' exists when the performance of each individual person is assessed and the results are given back to the group and the individual. It is important that the group knows who needs more assistance, support, and encouragement in completing the task and group members know that they are responsible for doing their share of the work. 'Promotive interaction' may be defined as individuals encouraging and facilitating each other's efforts to complete tasks and achieve in order to reach the group's goals. Group members help and assist each other, exchange information and resources, and encourage each other to be productive.

'Social skills' are the actions needed to effectively interact with other people. Leadership, decision making, trust building, communication, and conflict management skills are examples. Social skills form the basic nexus among individuals, and if individuals are to work together productively, they must have a modicum of these skills. 'Group processing' may be defined as reflecting on group efforts to (1) describe what member actions were helpful and unhelpful in achieving the group's goals and maintaining effective working relationships among members, and (2) make decisions about what actions to continue or change. The purpose of group processing is to clarify and improve the effectiveness of members in contributing to the joint efforts to achieve the group's goals.

Enhancing Factors

Deutsch (1962, 1973, 1985) has posited that trust, conflict, and distributive justice are mediators of the effectiveness of cooperation. The greater the trust, the more effective the cooperative efforts tend to be. Effective cooperation requires that conflicts of interest are resolved constructively. The effectiveness of cooperation is increased when benefits are distributed based on equality and need and when the distribution of benefits according to equity (i.e., high performers receive more than low performers) is avoided.

Competitive and Individualistic Efforts

Competition tends to result in constructive consequences when it occurs within a broader cooperative context, clear and fair rules, and criteria for winning are present, the task is appropriate, the task may be completed individually, competitors have an equal chance of winning, and winning is of low importance (Johnson and Johnson, 1999; Stanne et al., 1999). The conditions under which individualistic efforts have an advantage over cooperative efforts are unclear.

Applications

Cooperation underlies almost all aspects of human experience. Interpersonal interaction, family life, community life, organizational life, and even life within a society are all cooperative endeavors. Competition can occur and end, but the underlying structure of human existence is cooperation with others. Social interdependence theory has been applied to education, business, individual and group therapy, family therapy, mediation, organizational and community development, international conflict and peace building, and many other areas. The two arenas in which cooperation and competition have been especially applied, however, are education and business and industry.

The application of social interdependence theory to education is one of the most successful and widespread applications of social psychology to practice. From social interdependence theory, practical procedures have been created for structuring cooperative, competitive, and individualistic efforts in education at both the classroom and the school levels (Johnson et al., 2013). *Cooperative learning* is the instructional use of small groups, so that students work together to maximize their own and each other's learning. From being relatively unknown and unused in the 1960s, cooperative learning is now utilized in schools and universities throughout most of the world in every subject area and from preschool through graduate school and adult training programs. Its use so pervades education that it is difficult to find a textbook on instructional methods, teachers' journal, or instructional materials that do not discuss cooperative learning. There are three types of cooperative learning: formal cooperative learning that is used for assignments that

last from one class period to several weeks, informal cooperative learning that is used with direct teaching for quick discussions that last from a few minutes to one class period, and cooperative base groups that last for a semester or year provide each member with the support, help, encouragement, and assistance that he or she needs to progress academically. The three types of cooperative learning may be used in an integrated way to form an overall instructional program.

The second area in which social interdependence theory is applied is in business and industry (Tjosvold, 1989). While there is a long history of discussing the importance of cooperation within organizations, it is the advent of the team-based organization that most recently highlighted the importance of social interdependence theory for organizational functioning. Teams are organized into interdependent units (such as departments), which are then organized into an even higher level of interdependent units (such as divisions), which in turn are organized into one interdependent unit (the organization as a whole). Teams, rather than individuals, then become the basic organizational building block. In many cases, however, teams perform at less than an optimal level. A number of ways to improve team performance have been developed based on social interdependence theory (Tjosvold, 1989).

Breath of Social Interdependence Theory

A strength of social interdependence theory is that it may be used to understand the dynamics of cooperation on multiple levels. Not only does it illuminate interpersonal relations, but it also illuminates the dynamics of intergroup, organizational, societal, and world interdependence. Just as individuals are interdependent through their common goals, groups, organizations, and societies are also united through mutual goals. The dynamics of cooperation and competition at each level are the same. In addition, cooperation simultaneously has powerful effects on numerous outcomes, from productivity, motivation, quality of relationships, social support, psychological health, self-esteem, and many, many others.

Relationship among Theory, Research, and Practice

Social interdependence theory provides an example of how psychological theory, research, and practice interact in ways that enhance all three. Theory identifies and defines the phenomena of interest and their relationships with each other. Social interdependence theory is well formulated, clearly defines cooperation and competition, summarizes the existing research, and has generated considerable new research. Well over a thousand research studies have been conducted to validate or disconfirm social interdependence theory. Thus, there is sufficient research, with both high internal and external validity, to test the theory. The amount, quality, and generalizability of the research provide strong confirmation of the basic propositions of the theory and the effectiveness of cooperative relative to competitive and individualistic efforts. Finally, social interdependence theory has been applied in many diverse areas (most notably in education and business) and the applications have had profound effects on the theory and related research, revealing inadequacies in the theory and pointing to further research that needs to be conducted.

Future Directions

Despite the numerous studies that have been conducted, considerably more research is needed on the nature of cooperation and the variables that mediate its effectiveness. The nature of competitive and individualistic efforts and the conditions under which they are effective need to be further investigated. The values inherently taught by participating in cooperative and competitive situations are just beginning to be directly studied (Johnson and Johnson, 1999). Cooperation, for example, may promote a concern for the well-being of others and a desire to contribute to the common good, while competition may promote a desire to be better than others and a concern for self-gain at the expense of others. Individualistic experiences may promote a focus on self-benefit with little or no concern about others. There is a need to investigate the differences in the use of power in cooperation and competitive situations. The importance of studying cooperation and competition may continue to increase as the importance of world interdependence (such as increasing economic interdependence among countries) and the need for peace increase.

Abstract

The most prominent studies of cooperation in sociology proceed from some kind of rationality assumption. There are basically two groups of studies, one starting from the assumption of rational egoism and the other starting from the assumption of social rationality, in which other regard has a prominent place. The studies based on the assumption of rational egoists are strongly inspired by (mostly game-theoretical) developments in economics and political science, but add important sociological aspects to the analysis. Most important among these contributions are the dynamic analysis of cooperation, the link between formal and informal institutions, and the importance of social networks for embedding problematic transactions. Studies based on social rationality introduce assumptions on social preferences, learning, and framing. Important questions concern the circumstances that strengthen or weaken social preferences, the evolution of signals and conventions that govern trust, and the effects of goals on the definition of the situation. Studies using social rationality are on the rise.

The most prominent studies of cooperation in sociology proceed from some kind of rationality assumption. There are basically two groups of studies, one starting from the assumption of rational egoism and the other starting from the assumption of social rationality, in which other regard has a prominent place. The studies based on the assumption of rational egoism are strongly inspired by (mostly game-theoretical) developments in economics and political science, but add important sociological aspects to the analysis. Most important among these contributions are the dynamic analysis of cooperation, the link between formal and informal institutions, and the importance of social networks for embedding problematic transactions. Studies based on social rationality introduce assumptions on social preferences, learning, and framing. Important questions are those about the circumstances that strengthen or weaken social preferences, the evolution of signals and conventions that govern trust, and the effects of goals on the definition of the situation. Studies using social rationality are on the rise.

Individuals cooperate if each willingly acts in a manner that contributes to the other's welfare. Cooperation is one of the oldest and most revered topics in sociology, even though it has appeared under a variety of headings, such as 'social order' and 'solidarity.' The classical sociological answers to the question of how cooperation among individuals comes about differ in detail but share a common core: Cooperation is the result of shared values and norms and norm-conforming behavior.

A problem with this 'obligation-centered' solution is that there is no explanation of where norms come from and why the degree of norm conformity varies even for the same individual over time. Theories that might solve these problems were not developed until the 1970s, when a sea change in the basic assumptions on human action took place within sociology. At that time, analyses of cooperation among rational egoists (mostly rooted in game theory) began to shed new light on the way one might analyze cooperation, norms, and norm-conforming behavior. For some time, game-theoretic analyses of cooperation had become the most serious attempt to explain cooperation. Big advances were made but many problems remained, especially the problem that individuals do not seem to be as self-centered as they are assumed to be in game theory. Still, the game-theoretic analyses were powerful enough to suggest that there was no way back to explanations of cooperation that ignored human rationality all together. More recently, analyses based on some form of social rationality have arisen in order to address some of the unsolved problems. The following sections first present the most important aspects of sociological research on cooperation among rational egoists, and then discusses some contributions on cooperation with social rationality.

Cooperation Among Rational Egoists

It may not be quite realistic to assume that individuals are always looking out for themselves and that they do so by weighing the costs and benefits of their behavior. However, this assumption of 'rational egoism' seems to have four strong points in its favor. First, it allows one to pinpoint why cooperation is an interesting problem. Second, it allows rigorous theory formation with tractable structures of argumentation. Third, everyday experience and research give this assumption enough support to make it worthwhile to use it in the light of its analytic advantages, especially when analyzing interaction among interdependent individuals. Fourth, at later stages of theory formation, this assumption can be relaxed in favor of more realistic assumptions.

Game theory has furnished the most important instruments for such analyses, and since the late 1970s – inspired by developments in political science and economics – sociologists have begun to use it to study questions concerning cooperation, typically bringing sociological aspects into the analyses, such as network embedding. The crucial first step in the 'new' analysis was to identify typical situations in which cooperation is problematic: social dilemmas. A social dilemma is – roughly speaking – a situation in which the rational decisions of

individual actors are likely to lead to a collectively suboptimal outcome. An outcome is suboptimal (i.e., not 'Pareto-optimal') if one or more actors could improve their position without worsening the position of any other actors. In a social dilemma, individual and collective rationalities are in conflict. Cooperation can now be succinctly defined: An actor cooperates if and only if he or she chooses a course of action that will lead to a collectively rational outcome when other actors behave cooperatively as well. Social dilemmas occur when Pareto-superior behavior cannot be achieved by enforceable contracts. This may have many different reasons. For example, it may be impossible to communicate with others in order to come to an agreement; or, if communication is possible, transaction costs may be too high to actually reach an agreement. If agreements are within reach, it may be practically or epistemically impossible to specify all relevant future contingencies in the contract. Even if a contract can be drawn up, there may be no court with sanctioning power; or if there is such a court, it may not be possible to prove uncooperative behavior in court.

There are structurally different variants of social dilemmas, and game theory helps to distinguish them. For example, there is the common's dilemma (Hardin, 1968; Ostrom, 1990) in which various actors have free access to a resource (such as fishers from different nations in international waters); there are step-level public goods (Taylor, 1987), for which only a limited number of actors have to cooperate in order to produce the public good for a much larger group. A special case of this is the volunteer's dilemma (Diekmann, 1985), for which only one volunteer is necessary to produce the public good for all, such as rescuing a drowning child with a crowd of onlookers; there is the trust game (Dasgupta, 1988) in which the trustee can honor or opportunistically exploit the cooperation of the other (as when you lend money to an acquaintance who promises to pay it back with interest).

The prisoner's dilemma (PD) is by far the best-known variant of a social dilemma. It involves an arbitrarily large number of people. The special case of a two-person PD has been explored the best so far. In a two-person PD, both players have the option to cooperate or to defect (Figure 1). If both cooperate, each gets a payoff of value R. If one defects while the other cooperates, the defector gets T and the cooperator gets S. If both defect, both will get P, with $T > R > P > S$. There is a dominant strategy for each player (i.e., an individually rational choice, no matter what the other does) leading to a 'Nash equilibrium' (in which no player can unilaterally improve his or her position by deviating from the equilibrium strategy) and

	C	D
C	R, R	S, T
D	T, S	P, P

Figure 1 Prisoner's dilemma game. In the Axelrod simulation is T (temptation) = 5, R (reward) = 3, P (punishment) = 1, and S (sucker's payoff) = 0.

to a Pareto-inferior result. The assumption of rational egoism leads to two motives in a PD: the defensive motive to shield against exploitation (if the other defects you are better off defecting yourself), and the aggressive motive to exploit a cooperative player (if the other cooperates, you get even more by defecting). Together, these motive result in the conflict between individual and collective rationality. Mutual cooperation would be the Pareto-optimal result, but the two motives lead to mutual defection.

The Embedding of Cooperation

Raub and Weesie (2000) have suggested that game-theoretic work on solutions to social dilemmas can be divided into three kinds of embeddings of potential cooperation: embedding in time, in institutions, and in social networks. We follow their suggestion for this overview.

Time

When actors find themselves in a social dilemma that is iterated indefinitely over time, new sources for cooperation arise. First of all, defection can be sanctioned by the other players in later moves, and the resumption of cooperation by the defector can be rewarded by a similar response of the other players. Friedman (1977) and Taylor (1987) have shown that if the value of future outcomes is high enough, this opportunity to make one's cooperation conditional on that of the other leads to cooperative strategies with Nash equilibrium and Pareto optimality. Axelrod (1984) built on this result to ask the question of which strategy would be most conducive to lead to cooperation in an iterated PD. In order to answer this question, he conducted computer simulations in which various strategies played against each other for about 200 rounds. Axelrod had invited suggestions for the strategies that would create the most cooperation. The winner was the conditional strategy 'tit for tat' (TFT) suggested by the mathematician and psychologist Anatol Rapoport who gained his insight from early experimental studies with the repeated PD (Rapoport and Chammah, 1965).

TFT is very simple: (1) always begin with cooperation; (2) for the present round, copy the move of your partner in the previous round. TFT has a number of distinct features. It is 'nice,' because it starts with cooperation; it cannot be provoked, because it sanctions exploitation; and it is forgiving, because it returns to cooperation after the other has done so. Contrast this, for example, with 'permanent retaliation' in which defection is answered by unforgiving defection, a strategy that did much worse than TFT. It does not do well against all sorts of strategies and it does not respond optimally to mistakes that might occur with small probability (Nowak, 2012).

The heart of Axelrod's results, however, is thoroughly in line with a classical sociological insight: that the norm of reciprocity is probably the most essential norm generating cooperation in time-embedded interactions. As sociologists have argued for quite some time, homogeneity of a group in terms of important characteristics (including the use of 'nice' strategies) will increase the likelihood of reciprocity, as does smallness of the group because it helps identification of defection. Similarly, a low rate of fluctuation of membership helps reciprocity because it increases the shadow of the future.

A related argument has been made in terms of 'social capital' (Coleman, 1990).

Axelrod's tournament was based on the opportunity for 'direct reciprocity' among two actors. In larger groups, a system of cooperation may emerge because of 'indirect reciprocity.' In such a system A's cooperative decision in favor of B is not rewarded directly by B but by some other actor observing A's helpful act. Provided that cooperative acts increase an actor's reputation score, the possibility of indirect reciprocity leads, under certain conditions, to a stable state of cooperation (Nowak, 2012). Not formally proved systems of direct and indirect reciprocity had already been explored by classical sociologists and anthropologists decades ago (Blau, 1964), but modern game theory and agent-based simulation methods help to find out the conditions for the evolution and stability of cooperative systems.

Institutions

When reciprocity norms work, they are self-enforcing because no player can do better by unilaterally deviating from the cooperative strategy (Nash equilibrium). However, under many conditions, norms of reciprocity will not work properly. For example, when future contingencies are so complex that it is difficult to determine a priori what constitutes defection or difficult to detect defection, a reciprocity norm is not enough to secure cooperation. Similarly, such self-enforcing norms do not work well for the production of collective goods in larger groups, the less so the more inhomogeneous and fluctuating the group membership. In such situations, expectations concerning the relative importance of one's own and others' contribution are likely to be low and individuals tend to free ride rather than to contribute to the production of the collective good.

When self-enforcing norms do not work, cooperation may be achieved by embedding interactions in formal or informal rules that create 'selective incentives'; that is, added rewards for cooperating and punishments for not cooperating. This argument was first forcefully made by Olson (1965) and has been refined by sociologists and other social scientists (e.g., Hechter, 1987; Marwell and Oliver, 1993; Ostrom, 1990). For example, the state punishes tax evasion and provides some standard instruments for contracting; in many countries, labor unions offer extra benefits (such as cheaper insurance) for joining the labor union. The formation of institutional solutions has been explained by Hechter (1987) as a two-stage process. First, groups for the joint production of private goods are established (such as insurance). They are small enough that noncooperators can be detected and excluded (hence no free rider problem). The profits made from the joint production can then be used to establish selective incentives for the joint production of collective goods. In this way, labor unions may emerge from mutual insurance groups. Abell (1996) adds to this kind of analysis that a proper institutional explanation of cooperation should include the explanation of how cooperation can be combined with rivalry and competition. More work in this direction is needed.

Williamson (1985) has pointed to the importance of 'private orderings' in which, in the shadow of the law, contract partners may voluntarily restrict their own options, thereby creating selective incentives for their own cooperative action. For the partner, such measures work if there are 'credible commitments,' for example, by posted hostages and granted warranties. Sociologists have used this idea successfully to study contractual behavior (e.g., Weesie et al., 1998).

Often, credible commitments are difficult to establish (due to the size of the group) and formal institutional arrangements (with enforced sanctions) may not be available. In such groups, informal rules (social norms) that govern selective incentives for cooperation are needed. Like all rules, informal rules work only if they are enforced, and this creates the second-order free rider problem. Sanctioning noncooperators is itself a (step-level) collective good. There seems to be an infinite regress. How do groups get out of this problem? There is no handy solution to this problem within the rational egoistic approach, although suggestions were put forward recently (Raihani and Bshary, 2011; Przepiorka and Diekmann, 2013). However, as Heckathorn (1996), following Marwell and Oliver, has shown, public good production is not always subject to the first- and second-order free rider problems. In fact, the production function (i.e., the function that relates the proportion of cooperators to the level of the public good production) is likely to be S-shaped and only for certain values of the function will the situation have the structure of a PD. The reason for this is that an S-shaped production function implies a changing marginal utility from cooperation as the proportion of cooperators increases. Interestingly, Heckathorn also found that in certain phases 'hypocritical cooperation,' in which people criticize others for not cooperating even though they do not cooperate themselves, is quite effective in eliciting contributions to the collective good (Yamagishi, 1986). The main lesson to be learned from Heckathorn's analysis is that collective action should be analyzed dynamically, a conclusion one can also draw from Hechter's analysis of institutional controls mentioned above.

Social Networks

It has long been known in sociology that it often matters to people what other people say about them. Cooperation is helped by the effects of reputation within networks. For example, DiMaggio and Louch (1998) found in a national sample that consumers, when they are uncertain about products and performance, prefer to buy goods and services from suppliers with whom they have social ties outside the transaction itself. If the suppliers in such a network are clearly unreliable, the consumers are likely to have heard about it. If these suppliers begin to be unreliable, the network relations can be turned against them. Thus, networks have an information function (people learn about the cooperativeness of certain others) and a control function (people can use the network to sanction noncooperators).

Both aspects have been worked out game-theoretically by Buskens and Raub (2013). For dyadic transactions, characteristics of the network (such as density, 'indegree,' and 'outdegree'; that is, the number of others with whom people are connected) play an important role but it turns out that reputation effects are quite complex and there are indications that they might be less important than the temporal embeddedness. For economic transactions, Uzzi (1996) has found interesting additional effects of networks on tacit knowledge and joint problem solving. Network embeddedness for collective action has apparently not been studied yet in any rigorous way.

Yet another use of networks for the explanation of cooperation has been suggested by Coleman (1990). He points to the

importance of intermediaries for the creation of trust and thus for cooperation. Intermediaries can play a number of roles: as advisors who introduce interested parties and facilitate the interaction necessary to create trust; as guarantors who absorb the risk if trust turns out to be misplaced; and as entrepreneurs who combine the resources of several actors to place them into the hands of others who are expected to realize gains. For future research, a sociologically interesting question is under what conditions will structures with certain kinds of intermediaries emerge.

Cooperation Among Socially Rational Individuals

There is a growing sociological literature on cooperation that holds on to the assumption of rational action but adds specific 'bridge theories' on preferences, learning, and framing, the effect of which is to render regard for others quite prominent in the analyses. Rationality is seen as having evolved together with the ability to derive adaptive advantages from living in groups (Dunbar, 2003). Hence the term social rationality. Preferences are likely to have been influenced by this process, and the social influence on cognitive and motivational processes may even create situationally different kinds of rationality. In this literature the trade-off between empirical richness and analytical tractability is different than in most game-theoretic analyses. In the latter, added analytical power and tractability is often achieved by the rational egoist assumption at the expense of some loss in closeness to reality, whereas in the former, some analytical power and tractability is sacrificed in favor of added closeness to reality. Clearly, each kind of approach profits from the existence of the other. In this review, there remains room for the discussion of only a few developments.

Goals (Preferences)

By far the largest amount of literature on cooperation in the 'social rationality' category is concerned with 'social preferences.' Although the term preference is often used in this context, a better term would be 'social goals.' One variant of this approach, found in social-psychological and sociological research, is 'social orientation' research, in which individuals are differentiated according to their orientation toward others. This orientation is often assumed to be more or less stable and the joint result of nature and nurture. Different types of orientation are distinguished, most frequently the following three: 'cooperative' (the goal is to maximize joint payoffs); 'individualistic' (the goal is to maximize individual payoff); and 'competitive' (the goal is to maximize the positive difference between own and other's payoff). Such 'types' can be combined with game-theoretic analyses or with analyses of evolutionary learning at the population level.

A related but different approach emphasizes that human beings have evolved to have (pro)social goals that make them dependent on others and thus willing to cooperate for a variety of reasons. This concerns mainly the value of status (leading to cooperation by the strategic adaptation to authority relations, or to lack of cooperation due to status competition), the value of behavioral confirmation (leading to cooperation on the basis of conformity to peers' expectations), and the value of affection (leading to cooperation on the basis of liking) (Lindenberg and Frey, 1993).

Importantly, cooperation also depends on negative goals, especially the desire to punish noncooperators. An influential experiment by Fehr and Gächter (2002) demonstrates that subjects punish free riders in collective good situations even if sanctioning is costly. This type of behavior is called 'altruistic reciprocity.' Actors pay a price for negatively reciprocating to noncooperative behavior, thereby sustaining cooperation in a public good situation. Having the choice between a regime with sanction-free and sanctioning institutions in a collective good situation, most subjects chose the former in the beginning. However, after the breakdown of cooperation under the sanction-free regime, subjects increasingly change to the alternative regime. This experiment by Gürerk et al. (2006) exhibits that sanctioning institutions solving the problem of cooperation emerge in a dynamic, evolutionary process. Yet, on a societal level, the willingness to engage in costly punishing varies considerably among different cultures and countries (Henrich et al., 2006).

Sociologists and economists who focus on different types of people (in terms of orientation) are especially concerned with questions of signaling and the spread of strategies over time, some of them using genetic algorithms taken from evolutionary biology. This makes trust a central concept in the analysis of cooperation. For example: "Are the tendencies to trust and to honor trust correlated?" (Snijders, 1996); "How can cooperative types convincingly signal their type to others so that they will be trusted and cooperation comes about?" (Posner, 2000). Or "Under what conditions will effective rules for trusting (i.e., conventions for detecting cooperators) evolve in neighborhood interactions and spread across the population through contact with strangers?" (Macy and Skvoretz, 1998). One problem with this concept of social orientation is that it does not allow for situational influences on preferences and cognitions. Could not there be situations in which one is prosocial and others in which one would be quite egoistic?

Framing Effects

The willingness to cooperate seems also to depend on how people define a situation. Of particular importance is the difference between gains and losses. Kahneman and Tversky have shown that individuals are keener on avoiding losses than on achieving gains, *ceteris paribus*. This leads to the hypothesis that it is easier to bring about cooperation concerning the defense of a common pool resource than the achievement of a (new) public good. For example, it should be easier to bring about a campaign to preserve a rainforest than a campaign to create a wildlife preserve. The evidence for this is somewhat mixed (Van Assen, 1999), but when the disturbing effects are carefully controlled, the framing prediction finds support, especially for initial stages of cooperation (Sell and Son, 1997). There is also a claim that people often cognitively transform a PD into a game with conditional cooperation (assurance game). The interesting question then is how the beliefs that others will cooperate are influenced by social circumstances or by cultural beliefs (Hayashi et al., 1999), and what influence certain thresholds of cooperation have for triggering conditional cooperation in a larger group (Yamaguchi, 2000).

A different framing effect comes from 'goal framing' (Lindenberg and Steg, 2007). Overarching goals have a strong impact on the way individuals define a situation and thereby create a difference between 'foreground' and 'background' information and preferences. What is in the foreground will have a much stronger impact on behavior than what is in the background, *ceteris paribus*. For example, if the overarching goal (the goal frame) 'to act appropriately' is salient, then information on normative expectations and ways to meet them are in the foreground and in the center of attention, whereas the overarching gain goal 'to increase and guard one's resources' is in the background. As a result, when the goal-frame is normative (i.e., the goal to act appropriately is salient), orientation toward common goals and norms is focal and costs of cooperation are much less prominently perceived. Costs of cooperation must then be much larger in order to reduce people's willingness to cooperate than when gain itself is the goal frame. Sociologically, an important feature of overarching goals is that people are likely to signal their goal-frame to others through their behavior (e.g., through 'relational signals'), creating contagion effects that make (non)cooperation spread. The cooperative orientation linked to the normative goal-frame seems to be triggered especially when others show concern for norms and also when the situation is clearly one of reaching a common goal ('joint production,' Lindenberg and Foss, 2011). Group identity processes also play an important role (Simpson and Macy, 2004). All this puts a high premium on including cues that signal goal-frames (prominently including symbolic behavior) in the analyses of cooperation, even in game-theoretic analyses, and in the analysis of how institutions work to foster cooperation.

All in all, in sociology, studies on cooperation are both based on the assumption of rational egoists and on some kind of social rationality. The latter are clearly on the rise in number and sophistication.

Abstract

We survey the literature on coalitional games, focusing on recent developments and on the axiomatic approach to the subject.

Introduction

Consider a group of agents, or 'players,' to whom is available a set of payoff vectors, when a choice has to be made from this set. Included in the description of the situation is a set of payoff vectors available to each subgroup of players. Altogether, we have a 'coalitional game.' The question is: What should be assigned to each player? In answering this question, proper account should be taken of the opportunities open to the various groups to which he belongs; these opportunities should be compared, and what they mean for players should be assessed. But how? What formula or procedure should we use? On what principles should we base their evaluation? The objective of the 'theory of cooperative games' is to answer these questions. What follows is a presentation of the main concepts that have been elaborated in this theory, and some central results. The literature is vast, consisting of several thousand items, and we have had to be very selective. Hopefully, our survey still conveys a sense of the achievements of this research program.

The analysis starts with the specification of domains of games. Two main ones are traditionally considered. First, what a coalition can achieve is given as a single number, interpreted as 'utility,' which the coalition can distribute among its members in any way it wishes, the sum of their assignments being equal to that number. Then, utility is interpersonally comparable across players and transferable at a one-to-one rate from one to the other. These are 'transferable utility' games. (It is simplest to think that what is achievable by each coalition is expressed in dollar terms. For that reason, these games are sometimes called 'games with side-payments.') Second, what a coalition can achieve is specified as a subset of its 'utility space' satisfying some regularity conditions. Utility may still be transferable but at a rate that depends on the starting point. These are 'nontransferable utility' games. (They are also sometimes called 'games without side-payments.' The unfortunate way in which the terminology has solidified does not reflect well what distinguishes the first situation from the second one; it is not so much whether utility or payoff is transferable that is at issue, but rather whether the rate at which transfers can be made is constant or not. A game in which utility is not transferable at all would consist of the comprehensive hull of a single point for each coalition.)

At the risk of oversimplifying, one can say that the early literature on coalitional games was mainly concerned with defining solutions and with existence and structural issues. In the past 30 years, most work has been axiomatic: desirable properties of solutions are formulated, as axioms, and the search is for solutions satisfying the properties in various combinations.

What are the main directions that the recent literature has taken? First, a number of new axioms and new solutions have been defined; new characterizations of standard solutions have been developed and these new solutions have also been characterized. Second, multiple enrichments of the base models have been proposed and analyzed in detail. Third, applications have multiplied.

Several specialized surveys have appeared in the *Handbook of Game Theory* (1994). General treatments of the subject are Weber (1994), Peleg and Sudhölter (2007), and Peters (2008).

General Definitions: Games with Transferable Utility

There is a group N of *players* who can gather in *coalitions*. (A coalition is a *nonempty* subset of N; we apply the term even to subsets consisting of a single player.) The group N itself is the *grand coalition*. For each coalition $S \subseteq N$, a number $v(S)$ is specified, the *worth of S*, which is understood as the maximal amount of 'utility' that S can achieve somehow, and that can be distributed among its members, any vector of payoffs in $\mathbb{R}^S$ whose components do not add up to more than $v(S)$ being available to them. Summarizing, a *transferable utility coalitional game*, simply a *TU game*, is a vector $v \equiv (v(S))_{S \subset N} \in \mathbb{R}^{2^{|N|}-1}$. Let $\mathcal{V}^N$ be the domain of all games.

Games can be given as primitives, but they can also be derived from other data, for instance, resources that players control individually or within coalitions. Production processes may be available to a coalition. When some goods are public goods, or when other forms of externalities are present, the calculation of the worth of a coalition is delicate because how the complementary coalition behaves is relevant to the calculation, and assumptions have to be made about what that coalition has chosen to do. One should not expect a simple and unique answer to these type of questions, and extreme scenarios have been used as benchmarks. According to the most pessimistic scenario, the easiest to define, the complementary coalition contributes nothing. Alternatively, one can imagine a strategic game played by coalitions: each coalition chooses some action, and to each profile of actions is associated outcome; the strategic equilibria are identified, and the resulting payoffs to the coalitions define their worths. (This is what von Neumann and Morgenstern suggested in general to derive cooperative games from strategic situations.) Absent such a game, one can simply think of $v(S)$ as some index of opportunities open to S. What is important is that the index be calculated consistently across coalitions. It is usually straightforward to calculate the worth of the grand

coalition, however, because the complementary coalition is empty.

Various subclasses of games have been considered. Some have arisen naturally in applications to economics and political science; others have emerged out of mathematical considerations. It will be convenient to collect all the definitions here. Most of them have to do with quantifying the synergies that may exist between players. The game v is *inessential* if there is $x \in \mathbb{R}^N$ such that for each $S \subseteq N$, $v(S) = \sum_S x_i$. It is *essential* if, for each $S \subseteq N$, $\sum_S v(\{i\}) \leq v(S)$. It is *simple* if all its coordinates are either 0 or 1 (in political science applications, these numbers represent 'losing' or 'winning' an election). It is *monotonic* if, given two coalitions related by inclusion, the worth of the larger is at least that of the smaller one: for each pair S, $T \subseteq N$ with $S \subset T$, we have $v(S) \leq v(T)$. It is *super-additive* if the worth of a coalition is at least the sum of the worths of the components of each of its partitions: for each $S \subseteq N$ and each partition $(S_k)_{k \in K}$ of S, we have $v(S) \geq \sum_{k \in K} v(S_k)$. This is the case if these subcoalitions do not get in each other's way. The property would not be met, for example, if each subcoalition would need a particular facility controlled by S, but that only one subcoalition could use at a given time. The game is *convex* if there are strong synergies between players: for each pair S, $S' \subset N$ such that $S \subset S'$ and each $i \notin S'$, we have $v(S \cup \{i\}) - v(S) \leq v(S' \cup \{i\}) - v(S')$. Consider, for instance, workers who are supplying homogeneous labor to a convex technology; then, plotting the worth of coalitions as a function of their size gives us a convex function; alternatively, a game is convex if for each pair S, $S' \subset N$, we have $v(S \cup S') + v(S \cap S') \geq v(S) + v(S')$. A game is *symmetric* if the worth of a coalition only depends on its size.

The *dual of* v, v^d, is the game defined by setting, for each $S \subseteq N$, $v^d(S) \equiv v(N) - v(N \backslash S)$. Duality is useful in structuring the theory. The notion can be applied to solutions as well, and to properties of solutions. Properties of games that are preserved under duality are identified by Charnes et al. (1978). Other studies of duality are by Funaki (1995), Klijn et al. (2001), and Oishi et al. (2013).

A (feasible) *payoff vector* for v is a vector $x \in \mathbb{R}^N$ such that $\sum_N x_i \leq v(N)$. Let $\mathcal{G}^N \subseteq \mathcal{V}^N$ be a domain of games with player set N. A *solution on* $\mathcal{G}^N$ is a correspondence that associates with each $v \in \mathcal{G}^N$ a nonempty subset of its set of payoff vectors. Each x selected by the solution for $v \in \mathcal{G}^N$ is interpreted as a list of amounts that the players can 'expect' from v, either from some process of bargaining that is left unspecified or as the recommendation that an arbitrator could make. A *single-valued* solution is a *value*. Several of the central solutions are *single valued*, but several important others are not.

We also consider an enriched model in which the population of players is not fixed. There is now a set of 'potential' players, which may be infinite, but any game involves finitely many of them. Let $\mathcal{N}$ be the class of its finite subsets. Here, a solution is a mapping from $\cup_{N \in \mathcal{N}} \mathcal{G}^N$ to $\cup_{N \in \mathcal{N}} \mathbb{R}^N$. It associates with each $N \in \mathcal{N}$ and each $v \in \mathcal{G}^N$ a nonempty subset of the set of feasible payoff vectors of v.

The *subgame of a game* $v \in \mathcal{G}^N$ *with respect to* $N' \subset N$ is the game $(v(S))_{S \subseteq N'} \in \mathcal{G}^{N'}$. Many of the properties of games listed above are inherited by their subgames (e.g., super-additivity and convexity), as is easily checked.

It will also be useful to evaluate a payoff vector selected for a game $v \in \mathcal{G}^N$ in relation to the list of payoff vectors selected for its subgames. A (feasible) *payoff configuration for* v is a list of payoff vectors, one for v and one for each subgame of v. A *payoff-configuration solution on* $\mathcal{G}^N$ is a correspondence that associates with each $v \in \mathcal{G}^N$ a list, indexed by the subsets of N, of nonempty subsets of the sets of payoff vectors for the corresponding subgames of v. A *payoff-configuration value* is defined in a similar way, but it is *single valued*. Note that two games v and $v' \in \mathcal{G}^N$ may have the same subgames relative to some coalition S (i.e., $v_S = v'_S$), but the components relative to S of the payoff configurations chosen for v and v' by a payoff-configuration value differ.

An Inventory of Solutions

In presenting the various solutions and values that have been discussed in the literature, we proceed in steps, starting with naive and imperfect definitions, and progressively attempting to come up with more satisfactory ones. The definitions can be organized in several ways. A meaningful partition is based on whether they are *single valued* or not. *Single-valued* solutions make precise recommendations and are more likely to be useful. Another partition, which is how we chose to organize the material, is into *coalition-centric* and *player-centric* mappings. Indeed, some solutions can be seen as attempting to satisfy, or at least to 'mollify' coalitions, taking into account what they can achieve. The difficulty in doing so is that the number of instruments, namely the coordinates of the payoff vector chosen for a game, is very small in relation to the number of coalitions (n versus $2^n - 1$). The focus of the player-centric solutions is on assessing what individual players contribute to the various coalitions to which they belong, and on basing the calculation of payoffs on this assessment. What makes this approach delicate is that the members of a coalition contribute jointly to creating its worth (at least, the data of a game do not include information that can help us in disentangling their contributions), and that coalitions overlap. How much of the worth of a coalition should be imputed to each of its members, and how should the fact that each player belongs to multiple coalitions, be handled?

One should not expect to find a unique way of solving these conceptual difficulties, but the axiomatic approach helps us evaluate the relative merits of solutions and values that have been proposed as answers.

For several of the solutions introduced in the subsequent sections, nonemptiness is not guaranteed, and for some, identifying those games for which nonemptiness holds has been a central research question.

Let N and $v \in \mathcal{G}^N$ be fixed.

- Our first solution embodies the common and basic requirement that there should be no waste: the worth of the grand coalition should be fully allocated.

A *pre-imputation of* v is a vector $x \in \mathbb{R}^N$ whose coordinates add up to $v(N)$: $\sum x_i = v(N)$. The *pre-imputation solution*, *preI*, selects all pre-imputations of v.

- An *imputation* is a pre-imputation at which each player is assigned at least his own worth. The *imputation solution*, *I*,

selects all of these pre-imputations of v: $I(v) \equiv \{x \in preI(v)$: for each $i \in N$, $x_i \geq v(\{i\})\}$. For imputations to exist, it is obviously necessary and sufficient that $v(N) \geq \sum v(\{i\})$. This is the case for what we call an essential game.

- What underlies the definition of the *core*, C (Gillies, 1953) is the assumption that a coalition has access to all the possible vectors whose coordinates add up to its own worth. The core selects all the imputations of v over which no coalition S can improve by distributing $v(S)$ among its members: $C(v) \equiv \{x \in \mathbb{R}^N : \sum x_i = v(N), \quad \text{and for each } S \subset N, \quad \sum x_i \geq v(S)\}$.
- The validity of an objection may be called into question if it has a compelling counter-objection. Several definitions of *bargaining sets* as sets of payoff vectors such that each objection has a counter-objection have been proposed, implementing the idea. Peleg and Sudhölter (2007) are particularly detailed on the subject and we can do no better than to recommend that they be consulted. We limit ourselves to the central ideas. The original definition is due to Aumann and Maschler (1964). Given a pre-imputation x of v and two players, i and j, an *objection* of i against j is a pair of a coalition S that contains i but not j, and a payoff vector y feasible for S such that its members' payoffs are at least as large at y as at x, strict inequality holding for at least one i. A counter-objection is raised by a coalition T that contains j but not i; it is a payoff vector z feasible for T such that each of its members's payoff is at least as large at z as at x or as at y if he belongs also to T.

Related definitions are due to Mas-Colell (1989) and Zhou (1994). Shimomura (1997)'s definition differs from that of Mas-Colell's in two ways: he works with imputations instead of pre-imputations, and he insists that to be valid, objections and counter-objections should bring about an increase in the payoffs of all of the players who raise them. Another definition, proposed by Granot (1994, 2010), is studied by Granot and Maschler (1997).

- A' *von Neumann–Morgenstern solution of* v (note the indefinite article) is a subset K of the set of feasible vectors satisfying two conditions: *internal stability* says that no point of K should dominate any other point of K; *external stability* says that each point not in K should be dominated by some point of K.
- The definitions just given do not distinguish between the objections that a coalition can make to a payoff vector in terms of the magnitude of the difference between the sum of the payoffs to its members and its worth; only the sign of this difference matter. The next definition takes that magnitude into account; indeed, one would expect that it should play a role in motivating coalitions to identify and register objections. Given x, a pre-imputation of v, define the *dissatisfaction of coalition S at x in v* as the difference $v(S) - \sum_S x_i$.

The *prenucleolus*, *PreNuc* (Schmeidler, 1969) selects the pre-imputation of v at which the dissatisfactions of the various coalitions are minimized in the lexicographic order, starting with the coalition with the largest dissatisfaction. We write in singular ('the pre-imputation') because it turns out that there is a unique point solving this sequence of minimizations. The *nucleolus*, *Nuc*, is defined in a similar way but the minimization is carried out within the set of imputations.

- The next definition is based on an attempt to reach a 'balance' between how each player is treated in relation to each other player. First, we propose a measure of what player i can achieve without the help of player j. Given x, a pre-imputation of v, and $i, j \in N$, let $s_{ij}(v, x) \equiv \max\{v(S) - x(S) | S \subseteq N,\ i \in S,\ j \notin S\}$. The *prekernel*, *preKer*, selects the pre-imputation at which these measures are as equal as possible across players: $preKer(v) \equiv \{x \in preI(v)$: for each pair $i, j \in N$, $s_{ij}(v, x) = s_{ji}(v, x)\}$.

For the *kernel*, equality of the measures is insisted upon, but payoff vectors are required to be imputations.

- The next definition is concerned with overall distributions of payoffs. Equality is the goal, but the core constraints have to be respected, so we approximate equality subject to them.

The *Dutta–Ray value*, *DR* (sometimes called the Fushishige–Dutta–Ray solution; Dutta and Ray, 1989) selects, for each convex game v, the element in the core of v – the unique element – that is closest to the payoff vector at which each player is assigned an equal share of $v(N)$ (see the plain egalitarian value in the following). It turns out that the Dutta–Ray payoff vector 'Lorenz-dominates' each other element in the core of v. (Given two vectors $x, y \in \mathbb{R}^N$ with $\sum x_i = \sum y_i$, x 'Lorenz-dominates' y if rewriting their coordinates in increasing order, and denoting the results $\tilde{x}$ and $\tilde{y}$, we have $\tilde{x}_1 \geq \tilde{y}_1$, $\tilde{x}_1 + \tilde{x}_2 \geq \tilde{y}_1 + \tilde{y}_2$, and so on, with at least one strict inequality holding.)

The mappings defined next, whose focus is on rewarding individual players, what we called 'player centric,' are *single valued*. Most of them are based on the concept of a *player's contribution to a coalition*. It will be convenient to use the expression in two different ways depending upon whether the player is a member of the coalition or not. Let $i \in N$ and $S \subseteq N$. If $i \in S$, it is the difference $v(S) - v(S \backslash \{i\})$; if not, it is the difference $v(S \cup \{i\}) - v(S)$. *Player i's principal contribution* is his contribution to the grand coalition, $M_i(v) \equiv v(N) - v(N \backslash \{i\})$.

- Equality and proportionality are two polar notions in almost all branches of the theory of economic justice. Implementing the first notion requires that a baseline be chosen and implementing the second one that a direction also be chosen. As we see, several options are possible. We start with simple egalitarian ideas – one can almost say 'simplistic' – and make successive adjustments so as to better achieve our goal of assigning to each player what he deserves. At first, the baseline for each player is a payoff of 0.
- The *plain egalitarian value* (sometimes called the 'egalitarian value'; Radzik (2013) calls it the 'equal split value' and van den Brink (2001) calls it the 'equal division solution') divides the worth of the grand coalition equally among all players: for each $i \in N$, $x_i = \frac{v(N)}{|N|}$. Because it ignores the worths of other coalitions, this value seems far from achieving our goal.

In the next two definitions, baselines are derived from the game.

The *egalitarian-over-individual-worths value* (sometimes called the CIS value; the name the 'egalitarian value' is also used, for

instance, by Chun and Park (2011), while van den Brink (2001) calls it the 'equal surplus division solution') first assigns to each player his individual worth, then divides what remains of $v(N)$ equally among all players: for each $i \in N$,

$$x_i = v(\{i\}) + \frac{v(N) - \sum_N v(\{j\})}{|N|}$$

This value is a little more sensitive to the data defining the game but not much; it depends on only $n-1$ of its $2^n - 1$ coordinates.

The *egalitarian-over-principal-contributions value* (sometimes called the 'egalitarian value'; when applied to cost allocation, it is called 'equal division over non-separable costs') first assigns to each player his principal contribution, then divides what remains of $v(N)$ equally among all players: for each $i \in N$,

$$x_i = v(N) - v(N \setminus \{i\}) + \frac{v(N) - \sum [v(N) - v(N \setminus \{j\})]}{|N|}$$

In economics, rewarding factors on the basis of their marginal product is a well-established idea. However, its application here delivers a solution that, once again, does not seem responsive enough to the data defining a game; it also ignores most of its coordinates.

- Imagining that players enter the game one at a time, in some order, and assigning to each his contribution when he arrives generates a plausible value provided one can justify the order. No such justification is given in the description of a game but the idea will nevertheless be a central ingredient in several important definitions below, so a formal introduction is needed.

Let $\mathcal{O}^N$ be the set of strict orders on N. Given $\prec \in \mathcal{O}^N$, the *sequential contribution value associated with* $\prec$, $SC^{\prec}$ (sometimes called 'marginal values') assigns to each $i \in N$ his contribution to the coalition of all the players who are listed before him in the order: $SC_i^{\prec}(v) \equiv v(\{j : j \prec i\} \cup \{i\}) - v(\{j : j \prec i\})$.

How much a player is assigned by a sequential contribution value obviously depends on where he stands in the order and on the game: in general, there is no relation between a player's position and his payoff. (For special classes of games, such as convex games, this is not the case however.) To introduce some fairness into the process, averaging over all orders is natural. The *Shapley value Sh* (Shapley, 1953) which occupies a central place in the literature, can be interpreted in this way, as the simple average of the sequential contributions values calculated under the assumption that all orders occur with equal probabilities, namely $Sh(v) \equiv \frac{1}{2^{|N|}} [\sum_{\prec \in O^N} SC^{\prec}(v)]$. Collecting terms (all of the orders in which the same players precede player i produce the same contribution for him), we obtain the better-known formula:

$$Sh_i(v) \equiv \sum_{S \subseteq N \setminus \{i\}} \frac{|S|!(|N| - |S| - 1)!}{|N|!} [v(S \cup \{i\}) - v(S)]$$

.

Other formulas for the Shapley value are due to Kleinberg and Weiss (1985), Rothblum (1985), and Béal et al. (2012b).

The proposal has also been made to work with the convex hull of the sequential contributions values. The result is the *Weber solution* (Weber, 1988).

- We now turn to notions of proportionality. Here, when distributing payoffs, in addition to the question 'Where from' we should ask 'To where?' A baseline should still be specified for each player from which to measure his gain, but also an amount to which he may 'aspire.' The values defined next provide simultaneous answers to these questions. We could imagine others.

The inspiration for the *τ-value* (Tijs, 1981) is a solution for bargaining games known as the Kalai–Smorodinsky solution (Kalai and Smorodinsky, 1975). Recall that $M_i(v)$ designates player i's principal contribution in v, and let $m_i(v) \equiv \max_{S \subset N \setminus \{i\}} [v(S) - \sum_S M_j(v)]$ and $m(v) \equiv (m_i(v))_{i \in N}$. Then, on the domain of games for which $m(v) \leq M(v)$ and $\sum m_i(v) \leq v(N) \leq \sum M_i(v)$ (Tijs calls these games 'quasi-balanced') $\tau(v)$ is the efficient vector on the segment connecting $m(v)$ and $M(v)$. A generalization of the definition to the domain of all games is due to Driessen and Tijs (1981).

Questions to Be Addressed

What issues can be raised when studying solutions and values?

Nonemptiness

First is nonemptiness. Many values are given by an explicit formula, so the issue of existence does not arise for them. Examples are the Shapley value, its variants, and all of the other player-centric values that are based on the random arrival scenario that underlies the Shapley value but involve alternative distribution schemes.

Several important solutions are only defined indirectly. Proving that they are well defined, or identifying classes of games for which they are, has filled the agenda of researchers for many years.

This is the case for the core, for the various notions of bargaining sets, and for the von-Neumann–Morgenstern solution. For the core, a necessary and sufficient condition has been identified that guarantee nonemptiness. Keeping fixed the worths of all the coalitions $S \subset N$, an explicit lower bound on $v(N)$ can be given as a function of the former. This is the well-known Bondareva–Shapley theorem. First define a *balanced pair* as a list $\mathcal{S}$ of coalitions and a list of weights $(\lambda_s)_{S \in \mathcal{S}}$ for them, such that for each $i \in N$, the sum of the weights assigned to those coalitions in $\mathcal{S}$ that contain player i is equal to one: $\sum_{S \in \mathcal{S}: i \in S} \lambda_S = 1$. Let $\mathcal{B}$ denote the class of all such pairs. The lower bound on $v(N)$ for $C(v)$ to be nonempty is the maximum over all $(\mathcal{S}, (\lambda_s)_{S \in \mathcal{S}}) \in \mathcal{B}$ of the weighted sum of the worths of the coalitions appearing in the list: $\max_{(\mathcal{S}, (\lambda_s)_{S \in \mathcal{S}}) \in \mathcal{B}} \sum_{S \in \mathcal{S}} \lambda_S v(S)$. Let us call it the *Bondareva–Shapley lower bound*. The inequality turns out to be sufficient. A game for which it is met is *balanced*.

Theorem 1 (Bondareva, 1963; Shapley, 1967) *A game has a nonempty core if and only if the worth of the grand coalition meets the Bondareva–Shapley lower bound.*

For the von-Neumann–Morgenstern, it took many years for the issue of existence to be understood. In fact, it is not generally guaranteed (Lucas and Rabie, 1982). For the various notions of bargaining sets, for the prekernel, an important proof technique is based on the facts that the prenucleolus belongs to it, and that the prenucleolus is well defined (Schmeidler, 1969).

Some solutions are defined by means of maximization exercises. Showing the existence of solutions may be straightforward, but solving these exercises may be computationally complex. This is true for the nucleolus, which is in general notoriously difficult to calculate. Simpler algorithms may be available for certain classes of games, however. An explicit formula can be derived for the nucleolus for the simple cost allocation problem known as the airport problem (Littlechild, 1974). Convex games (Arin and Inarra, 1988) and assignment games (Solymosi and Raghavan, 1994) also lend themselves to explicit calculations. There are also domains of games on which a particular solution or value may coincide with one that is usually easy to calculate. We identify below a domain for which the nucleolus and the Shapley value coincide.

Accessibility

For a solution whose nonemptiness has been established, the follow-up question arises of how to reach at least one of the payoff vectors it recommends, for each game, is important in practice. We speak of the *accessibility* of the solution then. Much is known about the core in this regard. When the core is nonempty, it can be reached through a step-by-step process that starts at an arbitrary payoff vector and involves satisfying blocking coalitions as they emerge. Much is also known about how many steps are needed (Sengupta, A. and Sengupta, K., 1996; Kóczy, 2006; Béal et al., 2012a; Yang, 2010, 2011).

Extensions

When a solution is empty for a class of games of interest, the question arises of extending its definition to the class so as to recover existence. For an extension to be meaningful, it should preserve the spirit of the original definition, it should coincide with the solution whenever the solution is nonempty, and preferably, the extension should be minimal. For the core, several extensions have been proposed. Given $\epsilon > 0$, the *ϵ-core* of a game consists of all its efficient vectors at which none of the blocking constraints is violated by more than ϵ. Its *least core* is defined to be its ϵ-core for the smallest value of ϵ that guarantees nonemptiness. Recent definitions are due to Bejan and Gómez (2009) and Derks et al. (2013).

When the core is empty, at least one coalition has to be assigned in total less than its worth. One could argue that fairness across coalitions requires that all coalitions be so treated. An imputation belongs to the *anticore* of v if for each $S \subset N$, $\sum x_i \leq v(S)$. A game can be such that both its core and its anticore are empty however.

The *positive core* (Orshan and Sudhölter, 2010) is a combination of the core and the prenucleolus. It coincides with the core on the domain of TU games whose core is nonempty.

The *Lorenz stable set*, the *leximin stable allocation*, and the *egalitarian core* (Arin and Inarra, 2001) are extensions of the Dutta–Ray value to the entire domain of games whose core is nonempty. (Recall that this value is defined on the class of convex games.) The *equal split-off set* (Branzei et al., 2006) is a further extension, to the domain of all TU games.

Selections

When a solution is nonempty, the question of selection arises. To the extent that eventually, only one payoff vector will have to be chosen from the set of vectors that the solution recommends, identifying a most desirable one in the set is important.

The *core center* (González-Díaz and Sánchez-Rodríguez, 2007) selects the center of gravity of the core.

Given a game whose core is nonempty and an order of players, consider the following procedure: give the first player the most he can get within the core; give the second player the most he can get within the subset of the core of payoff vectors at which the first player gets the amount just calculated; give the third player the most he can get within the subset of the core of payoff vectors at which the first and second players get the amounts calculated above, and so on. The *average lexicograhic value*, *Alex* (Tijs, 2005; Tijs et al., 2011) picks the average of the payoff vectors obtained this way for each order of players.

Solution-Specific Structural Issues

For each particular solution and value, specific issues may arise concerning the algebraic and geometric properties of the set of payoff vectors it selects, and how this set responds to changes in games. An example of such a result, which concerns the core, is a decomposition: a positive game with a nonempty core can be written as a positive linear combination of veto-controlled simple games (Derks, 1987). These components have a clear economic interpretation.

For a particular solution, special games may come up in its study. A game is *exact* (Schmeidler, 1972) if for each $S \subset N$, there is x in the core of v such that $\sum_S x_i = v(S)$.

The *upper core* of a game is the set of payoff vectors that violate all of the core constraints. The core of a game is *large* (Sharkey, 1982) if for each vector y in its upper core, there is a core vector that is dominated by y (Moulin, 1990; Azrieli and Lehrer, 2007; Getán and Montes, 2010; Estévez-Fernández, 2012).

Certain operations on games preserve the nonemptiness of a particular solution. An example is increasing the worth of the grand coalition. Van Gellekom et al. (1999) refer to a property that is preserved by such an operation as a *prosperity property*. Super-additivity and convexity are examples. Having a nonempty core is obviously a prosperity property. It is unknown whether the core being a von-Neumann–Morgenstern solution is a prosperity property (Van Gellekom et al., 1999).

The space of games being a convex space, games can be added. An interesting question is under what conditions applying a solution to a sum of games is the same thing as applying the solution to each of them and adding the results. This question has been asked and answered about the core (Bloch and de Clippel, 2011, elaborating on Tijs and Branzei, 2002). Essentially, the extreme points should be determined

by the same sets of coalitions. The condition is satisfied in particular on the domain of convex games.

Variants of the Central Solutions

Variants of several of the main solutions have been defined.

The *equal division core*, C_{ed} (Selten, 1972) is obtained by restricting the possible divisions of a coalitional worth: objections by a coalition take the form of an equal division of its worth. (Given $w \in \Delta^N$, the *equity core relative to w* (Selten, 1978) is the set of vectors whose coordinates add up to the worth of the grand coalition to which no coalition can successfully object by means of a division of its worth among its members proportional to the components of w pertaining to them.) The equal-division core contains the core and its nonemptiness that is guaranteed under much weaker conditions. It suffices that the worth of the grand coalition be at least as large as the sum of the worths of the components of any partition (this is a weak form of super-additivity). This condition is not necessary however (Llerena and Vilella, 2013).

The *per capita nucleolus* and *per capita prenucleolus* (Grotte, 1970) are defined similar to the nucleolus and the prenucleolus, but using the per capita dissatisfactions instead of the dissatisfactions themselves.

The *modiclus* (Sudhölter, 1997; Raghavan and Sudhölter, 2005) is defined as the prenucleolus but using the differences of excesses instead of the excesses themselves.

The *least-square prenucleolus* (Ruiz et al., 1996) selects the pre-imputation at which the function $x \in \mathbb{R}^N \to \sum_{S \subset N} [v(S) - \sum_{j \in S} x_j]^2$ is minimized.

For each payoff configuration $x = (x^S)_{S \subseteq N}$, each pair of coalitions (S, T) such that $S \subset T$ and $|T| = |S| + 1$, and each $i \in S$, consider the difference $x_i^T - x_i^S$. The *monoclus* (Slikker and Norde, 2011) is a payoff configuration value that selects the payoff configuration at which the list of these differences is lexicographically minimized over the set of those payoff configurations that associate each coalition with an imputation for the corresponding subgame. The *premonoclus* is defined in a similar way but the minimization is carried out within the set of those payoff configurations that associate each coalition with a pre-imputation for the corresponding subgame.

Relating Concepts

How two solutions are related is an important issue. The Shapley value is always well defined, but a game may have a nonempty core and yet not contain its Shapley value. Hence, an interesting question is for what kinds of games does the Shapley value belongs to the core. One answer is the domain of convex games. In fact, the Shapley value has a simple expression then. We have already noted that the core of a convex game is a polytope whose corners are the vectors of sequential contributions. Thus, for convex games, the Shapley value is the geometric average of the corners of the core.

There are other games with the property that the Shapley value belongs to the core. Examples are the average convex games. This is shown by Sprumont (1990), Inarra and Usategui (1993), and Driessen (1998). Izawa and Takahashi (1998) and Marin-Solano and Rafels (1999) are other studies of this class of games.

Given the completely different ways in which the Shapley value and the nucleolus are defined, one would not expect them to often make the same recommendations. However, interesting classes of games have been identified for which they do (Deng and Papadimitriou, 1994; Kar et al., 2009; Chun and Hokari, 2007; Chang and Tseng, 2011). In fact, for convex games, many solution concepts are related that are not related in general.

When the core is nonempty, the nucleolus is a selection from it but two games may have the same core and yet have different nucleoli. For certain classes of games, this *core-only* property is satisfied however.

The Weber solution – recall that it is defined as the convex hull of the sequential-contributions values – contains the core, and for a convex game, it is equal to the core (Shapley, 1971).

When is the core the unique von-Neumann–Morgenstern stable set? An extensive and difficult literature has been devoted to the understanding of this question. A sufficient condition is that the core be large (Sharkey, 1982). This condition is also necessary for symmetric games (Biswas et al., 2000). Further work on this issue is by Van Gellekom et al. (1999) and Shellshear and Sudhölter (2009).

Our final result relates the core and the classical bargaining set. Keeping fixed the worths of all coalitions except that of the grand coalition, there is a number such that, as soon as the worth of that coalition is at least as large as that, the Davis–Maschler bargaining set of the resulting game equals the core (Izquierdo and Rafels, 2012).

Axioms

An axiom is the mathematical expression of the intuition we have about how a solution should behave in certain situations. A *punctual axiom* applies to each game separately, and a *relational axiom* relates choices made for games that are related in a certain way. We start with punctual axioms. For such an axiom, the only issue is existence: for each game, are there payoff vectors satisfying the axiom?

Basic Axioms

Let φ be a solution, $v, w \in \mathcal{G}^N$.

- *Efficiency* says that the sum of the payoffs is equal to the worth of the grand coalition.
- Some games have a trivial structure, and only one outcome seems natural for them. The following axioms pertain to such situations:

The *trivial-game axiom* says that if $v = 0$, then $\varphi(v) = 0$. Generalizing the idea slightly, we obtain the *inessential game axiom*, which says that if there is $x \in \mathbb{R}^N$ such that for each $S \subseteq N$, $v(S) = \sum_S x_i$, then $\varphi(v) = x$.

- There are other situations in which how much should be assigned to a player seems unequivocal.

The *dummy player axiom* says that if a player's contribution to each coalition is 0 – he is a *dummy player in the game* – he

gets 0. The idea expressed next is similar. The *null player axiom* says that if a player's contribution to each coalition is equal to his own worth – he is a *null player in the game* – he gets his own worth.

Similar requirements can be formulated for coalitions: if a coalition does not add anything to the worth of any other disjoint coalition by joining it beyond its own worth, its members do not get in total more than that amount.

The *nullifying player axiom* (van den Brink, 2007) says that if a player is such that the worth of each coalition containing him is 0 – he is a *nullifying player in the game* – then he gets 0.

- Next are bounds on assignments. Lower bounds may come to mind first. The *minimal-contribution lower bound* (Kikuta, 1976; Funaki, 1986; Gérard-Varet and Zamir, 1987) for a player is the smallest of his contributions to any coalition.

Upper bounds can be defined in a symmetric way. The *maximal-contribution upper bound* (Milnor, 1952) for a player is the largest of his contributions to any coalition.

Gérard-Varet and Zamir (1987) argue that unless a game is super-additive, the *maximal-contribution upper bound* may not be that relevant. They suggest that instead, the bound be calculated for the smallest super-additive game that dominates v, its *super-additive cover* (this concept is well defined).

- Next is a minimal punctual fairness axiom. First, *two players are symmetric in a game* if they contribute the same amount to each coalition to which neither belongs: for each $S \in N \backslash \{i, j\}$, $v(S \cup \{i\}) - v(S) = v(S \cup \{j\}) - v(S)$. Then, *symmetry* says that if two players are symmetric in a game, their payoffs are equal.

All of the solutions that we have defined are *symmetric* except of course for the sequential-contributions values. *Symmetry* appears to be a basic requirement but it is not always desirable. Two players who enter symmetrically in a game may differ in dimensions that are not explicitly incorporated in the model, and solutions and values that do not necessarily treat symmetric players symmetrically provide us with useful flexibility. Such mappings can often be obtained by modifying a standard *symmetric* definition through the introduction of weights assigned to players. A calibration step allows then a user of the theory to identify the weights that are the most desirable in his application. For some values, the parametrization is more complex. These extensions are for the Shapley value (Shapley, 1953; Kalai and Samet, 1987; Haeringer, 2006), the prenucleolus (Derks and Haller, 1999; Orshan and Sudhölter, 2012), the Dutta–Ray value (Hokari, 2000, 2002), the prekernel (Orshan and Sudhölter, 2012), and the solidarity value (Calvo and Gutiérrez, 2012).

- Next, we associate with each game an order relation on the player set, reflecting his 'desirability as a partner,' and require that the value should respect it. *Player i is at least as desirable as player j in v* if for each $S \in N \backslash \{i, j\}$, $v(S \cup \{i\}) - v(S) \geq v(S \cup \{j\}) - v(S)$; he is *more desirable* if in addition, one of these inequalities is strict. A solution *respects the desirability relation* (Maschler and Peleg, 1966), if whenever player i is at least as desirable as player j in v, his payoff is at least as large as player j's.

Similarly, "a coalition S can be defined to be at least as desirable as a coalition S' in a game" (Lapidot, 1968), and "a value can be said to respect the desirability relation for coalitions" if under these circumstances, it assigns to S in total at least as much as what it assigns to S' in total. The desirability relation for individual players is transitive but incomplete. The desirability relation for coalitions is neither transitive nor complete. Circumstances under which it is complete for simple games are studied in Einy (1985).

A related notion is the following: *player i is at least as desirable on average as player j in v* if $\sum_{S \subset N \backslash \{i,j\}} [v(S \cup \{i\}) - v(S)] \geq \sum_{S \subset N \backslash \{i,j\}} [v(S \cup \{j\}) - v(S)]$. This relation is both complete and transitive. The value φ *respects the average desirability relation* if in the circumstances just described, player i's payoff is at least as large as player j's: $\varphi_i(v) \geq \varphi_j(v)$ (Kultti and Salonen, 2007).

- When utilities are interpreted as von Neumann–Morgenstern utilities, the solution should be independent of the choice of origin of the chosen representative in the family. *Strategic equivalence* says that adding, for each player $i \in N$, an arbitrary constant $a_i \in \mathbb{R} > 0$ to his utility, and correspondingly adjusting the worths of all coalitions (so that for each $S \subseteq N$, $v(S)$ is replaced by $v(S) + \sum_S a_i$), results in a new game whose solution outcome is obtained from the solution outcome of the original game by adding to each player i's payoff the amount a_i.

A version of the axiom can be written for coalitions. *Coalitional strategic equivalence* (Chun, 1989) says that adding to the worth of each coalition containing some coalition $T \subseteq N$ the same number should not affect the payoffs to the players not in T. (*Strategic equivalence* is the special case obtained by repeated application for $|T| = 1$.)

- A game is a point in a Euclidean space. Thus, one can talk about the convergence of a sequence of games. *Continuity* says that the solution outcome of the limit game is the limit of the sequence of solution outcomes of the games in the sequence.

Almost all of the values that we have defined are *continuous*. These facts are easy to prove for those that are given by explicit combinatorial expressions (the Shapley value, for example). For some other values, proofs of *continuity* require work. Continuity notions can also be defined for solutions.

Monotonicity Axioms

A monotonicity axiom expresses the requirement that a player's payoff, or the payoffs of the members of some group, should move in a particular direction, as one parameter of the game to be solved moves in a particular way. (The hypotheses may involve several parameters changing together.) It may be felt that a player is entitled to at least as much as what he was assigned initially; or that each player in a particular group is entitled to at least as much as he was assigned initially, or that in the aggregate, the players in some group are entitled to at least as much as they were assigned initially. Due to the richness of the description of a game, these axioms come in a great variety of forms.

- The simplest parameter change we consider is an increase in the worth of the grand coalition. *Grand-coalition-worth monotonicity* (Megiddo, 1974) says that if the worth of the grand coalition increases, the payoff of no player decreases.

Many values satisfy this property. However, as soon as there are four players, the nucleolus violates it even on the domain of convex games (Hokari, 2000). Characterizations of selections from the core that satisfy *grand-coalition monotonicity* and other basic axioms are obtained by Calleja et al. (2013).

Individual-worth monotonicity says that if the worth of player i increases, his payoff does not decrease.

One can go further: *general individual–worth monotonicity* (Young, 1985) says that if the worths of all the coalitions containing player i weakly increase, then player i's payoff does not decrease.

Next, we consider changes in the worth of an arbitrary coalition and formulate two parallel axioms. *Coalitional-worth monotonicity* (Shubik, 1962) says that if the worth of a coalition increases, then the payoff of no member of that coalition decreases.

General coalitional-worth monotonicity says that if v and v' differ only in that for some $S \subseteq N$, and for each $\tilde{S} \supset S$, $v'(\tilde{S}) \geq v(\tilde{S})$, then the payoff of no member of S decreases.

Contribution monotonicity (Young, 1985) says that if the contribution vector of a particular player weakly increases, then his payoff should not decrease. *Weak contribution monotonicity* (Hokari and van Gellekom, 2002) says that if the contribution vectors of each player weakly increases, then the payoff of no player should decrease.

We have the following impossibility:

Theorem 2 (Young, 1985) *For games with at least five players, no value that selects from the core is coalitional-worth monotonic.*

Theorem 2 holds on the domain of super-additive games. However, on the domain of convex games, the weighted Shapley values and the weighted Dutta–Ray values are *coalitional-worth monotonic* (Hokari, 2002).

The following weaker property can be met more generally. The hypotheses are the same, but the conclusion pertains to the aggregate payoff of the members of the coalition whose worth increases. *Weak coalitional-worth monotonicity* (Zhou, 1991) says that under the hypotheses of *coalitional-worth monotonicity*, the sum of the payoffs of the members of S should not decrease.

The nucleolus satisfies *weak coalitional-worth monotonicity*. (As it is a selection from the core, by Theorem 2, it violates *coalitional-worth monotonicity*.)

When the worth of a coalition, which is not the grand coalition, increases, we may be interested in the impact of the change on the payoffs of the members of the complementary coalition, and demand that none of them should increase.

Further studies of monotonicity properties are by Arin and Feltkamp (2012). These authors formulate various strengthenings and conditional strengthenings of certain of these properties and they study their implications on the domain of games with nonempty cores and that have veto players.

- *Fair ranking* (Chun, 1989) says that if the worth of a coalition changes, there should be no reversal in the relative payoffs of two members of that coalition.

Independence and Invariance Axioms

Next are independence and invariance properties. The first one asserts the primacy of the concept of a contribution. As such, it is of particular significance to economists. *Own-contributions–only* (Young, 1985) says that if the contribution vectors of a given player to two games are the same, then his payoffs should be the same in both games. This axiom is implied by *contribution monotonicity*.

- Consider now a group of players who are involved in two separate games. The games may be solved separately, or they may be consolidated into one (by addition). Because it may be difficult to make the case than one way to proceed is better than another, if a solution is such that one player benefits from the consolidation whereas another player is hurt by it, it is less likely that a consensus will emerge as to what to do. The next axiom says that it should not make any difference to any player. *Additivity* (Shapley, 1953) says that the payoff vector selected for the sum of two games should be equal to the sum of the payoff vectors selected for each of them.

The next requirement applies to solutions: it is that players should have more options when they consolidate two games into one. *Super-additivity* (Peleg, 1986) says that the payoff vectors selected for the sum of two games should be obtained by adding payoff vectors chosen for each of the games.

- A *partnership in* v is a set of players S that affect the worth of a coalition only if all of them are included: if a coalition R does not contain all the members of S, its worth is equal to the worth of the coalition consisting of the players in R that do not belong to S. The *partnership axiom* (Kalai and Samet, 1987) says that if S is a partnership in v, the payoff to each member of S in v can be calculated by applying the value to the game in which the worth of each coalition containing S is equal to the aggregate payoff to the members of S, and the worth of each other coalition is equal to 0 (this is the multiple of the unanimity game associated with S scaled by $\sum_S \varphi_i(v)$).
- The *reciprocal impact axiom* (Myerson, 1977) says that the difference between player i's payoffs when everyone is present and when player j is not (then the game that is solved is the projection of the initial game onto the set $N \backslash \{j\}$) is equal to the difference between player j's payoffs when everyone is present and when player i is not.
- *Rationalizability by a potential* (Hart and Mas-Colell, 1989) says that there is a real-valued function P defined on $\mathcal{V}^N$ such that for each $v \in \mathcal{V}^N$ and each $i \in N$, $\varphi_i(v) = P(v) - P(v_{N \backslash \{i\}})$. This function is the *potential for the value*.

Some Characterizations

One of the foundation stones of the theory is the following:

Theorem 3 (Shapley, 1953) *The Shapley value is the only value satisfying efficiency, the null player axiom, symmetry, and additivity.*

Theorem 3 holds on the domain of super-additive games, and on the domain of simple games. The Shapley value also emerges on the domain of monotonic simple games and on the domain of simple super-additive games if *additivity* is

replaced by a variant (Dubey, 1975). This result is generalized by Einy (1988).

The weighted Shapley values have been characterized along the same lines but without *symmetry* (Kalai and Samet, 1987). The implications of dropping *efficiency* in Theorem 3 are studied by Dubey et al. (1981).

A related characterization is obtained by replacing the last two axioms of Theorem 3 by the requirement that adding to a game v a game v' in which two players are symmetric results in a new game $v + v'$ in which these two players' payoffs change by equal amounts (van den Brink, 2001). Although Theorem 3 does not extend to the domain of simple games (Dubey, 1975), this variant does.

A characterization of the values satisfying the axioms of Theorem 3 except for the *null player axiom* is due to Chameni Nembua (2012). Included are the plain egalitarian value and the solidarity value.

The critical relational axiom in the following result is *own-contributions-only*. Compared to Theorem 3, note that here the *null player axiom* is not listed.

Theorem 4 (Young, 1985) *The Shapley value is the only value satisfying efficiency, symmetry, and own-contributions-only*.

Theorem 4 holds on the domain of super-additive games (Young, 1985), on the domain of convex games (Hokari and van Gellekom, 2002), and on the domain of constant-sum games (Khmemlnistkaya, 2003). Both Theorems 3 and 4 hold on any domain consisting of a game and all the sums of integer multiples of its subgames extended to the whole player set by making the players who are not directly involved null players (Neyman, 1989).

Symmetry is not listed in the next result, but some symmetry is embedded in *fair ranking*.

Theorem 5 (Chun, 1989) *The Shapley value is the only value satisfying efficiency, the trivial-game axiom, coalitional strategic equivalence, and fair ranking*.

Theorem 5 also holds on the domain of super-additive games and on the domain of convex games.

The next characterization shows the strength of the *reciprocal impact axiom*, as *efficiency* is the only other axiom it involves.

Theorem 6 (Myerson, 1977) *The Shapley value is the only value satisfying efficiency and the reciprocal impact axiom*.

A parallel result holds when the *reciprocal impact axiom* is replaced by an axiom of *reciprocal impact axiom in subgames*. For player i, we calculate the difference between his payoff when everyone is present and his payoff when player j is not, and the game that is played is defined by setting the worth of each coalition equal to the difference between the worth of S together with the complement of S. We require equality of 'action and reaction.'

Our final characterization, of the Shapley value, is based on the concept of a potential.

Theorem 7 (Hart and Mas-Colell, 1989) *The Shapley value is the only value to admit a potential*.

All of the characterizations we presented are of the Shapley value and variants but more recently, other values have emerged.

Characterizations of the τ-value are due to Tijs (1987) and Calvo et al. (1995).

Variable-Population Axioms

We now turn to axioms pertaining to possible variations in population size. Accommodating such variations requires a different formalism. We imagine that there is a set of potential players, which we take to be the natural numbers. In each game, only finitely many of these players are present however. Let $\mathcal{N}$ be the class of finite subsets of $\mathbb{N}$. A value is then defined on $\cup_{N \in \mathcal{N}} \mathcal{G}^N$ and it takes its values in $\cup_{N \in \mathcal{N}} \mathbb{R}^N$.

- The first axiom is the most straightforward:

The *null player out* axiom says that the departure of a null player should leave unaffected the payoffs of the remaining players.

Notions of replications have been important in general equilibrium theory as a first step toward modeling situations with a large number of agents none of whom holds significant market power. To apply the idea to coalitional games, the first question is how to replicate a game. Several definitions are possible. Here is one that models minimal compatibility of interests between the original players and newcomers. In a *conflictual replicated game* (Thomson, 1986; Kalai and Samet; 1987), the worth of a coalition is equal to the worth of the set of players (or 'types'), in the original game, whose clones are all included in the coalition. The following axiom is not a property of a single solution but a property of a family of solutions consisting of a symmetric solution and its asymmetric generalizations.

- *Replication invariance* says that in a conflictual replicated game, the sum of what the players of each type obtain, under an application of a given symmetric solution, should be equal to what the player they are representing would obtain in the game that is replicated under an application of the asymmetric generalization of the solution with weights proportional to the orders of replication of the different types.
- To define the next property, we need to define the idea of two players merging into one and the converse operation, the idea of one player appearing under two identities. Suppose that players i and j merge into one player. Let S be a coalition that contains neither i nor j. Then, there are several ways to define the worth of the coalition consisting of S and the single player that represents i and j. It could be just the worth of $S \cup \{i, j\}$ in the original game, or it could be the maximum of the worths of $S \cup \{i\}$, $S \cup \{j\}$, and $S \cup \{i, j\}$.

Splitting proofness and *merging proofness* (Lehrer, 1988; Derks and Haller, 1999; Derks and Tijs, 2000; Casajus, 2012) says that when two players merge into one, the sum of what they obtain in the original game is equal to what the single player representing them would obtain in the new game.

- The next property pertains to situations in which some players may leave or some players may arrive. It was first considered in situations in which a social endowment of resources has to be distributed and each agent has monotonic preferences with respect to how much he consumes. In that context, a natural solidarity property is that, for example if new agents arrive, all agents initially present should be affected negatively. Given the generality of the type of situations covered by the model under study here, it

is not necessarily the case that when a game is extended to accommodate new players, opportunities would evolve in a way that would require sacrifices from the existing players. In fact, if there are sufficient synergies between them and the new players, the opposite may be true. This is the case that has mainly be studied. How much of a synergy is needed for it to be possible for all of the initial players to benefit? Convexity is enough.

Population monotonicity (Thomson, 1983) says that when a game is extended so as to accommodate new players, the payoff of none of the players initially present should decrease.

On the class of convex games, the Shapley value, the Dutta–Ray value, their generalizations called the monotone-path Dutta–Ray values are *population monotonic* (Hokari, 2002).

Instead of looking for solutions that respond monotonically to changes in the player set, one may inquire about the existence of payoff vectors for a given game that are related by inequalities to payoff vectors that could be chosen for subgames. A *population-monotonic payoff configuration for* $v \in \mathcal{G}^N$ (Sprumont, 1990) is a list of payoff vectors indexed by the subsets of N, $(x_S)_{S \subseteq N}$, such that for each $S \subseteq N$, $\sum_{i \in S} x_{iS} = v(S)$.

One may think of the list as the values taken by a *population-monotonic* solution defined on a very limited domain, namely the game v itself and all of its subgames. It is obvious that for a game to admit a *population-monotonic* payoff configuration, it should have a nonempty core and so should all of its subgames. Recall that such games are said to be totally balanced. This is not enough. Here is the complete characterization of these games:

Theorem 8 (Sprumont, 1990) *A game admits a population-monotonic payoff configuration if and only if it is totally balanced and it is the sum of an inessential game and a positive linear combination of monotonic simple games each of which has at least one veto player.*

Other relevant contributions here are by Moulin (1990) and Getán and Montes (2010). The monoclus (Silikker and Norde, 2011) is an example of payoff configuration value that picks a *population-monotonic* payoff configuration whenever the latter exists.

- Informally speaking, the 'consistency principle' says the following. Consider a game and identify a payoff vector chosen for it by a solution. Imagine now that some players leave with their payoffs and reassess the situation at this point; here, this means assess the opportunities open to each subgroup of the remaining players. The requirement is that in the resulting 'reduced game,' the solution should select a payoff vector at which each of the remaining players is assigned the same payoff as initially. Many scenarios have been imagined when defining the 'reduction operation.' We present the three central ones. A complete list is given in Thomson (2013).

For our first definition, given $N \in \mathcal{N}$, $v \in \mathcal{G}^N$, $x \in \varphi(v)$, and finally $N' \subset N$, we imagine that each coalition $S \subset N'$ is *required to get together with all the members of* $N \backslash N'$ *and pay them their components of* x. Then, what is left for S is the difference $v(S \cup (N \backslash N')) - \sum_{N \backslash N'} x_i$. We define this difference to be its revised worth.

Complement consistency: For each pair N, N' of elements of $\mathcal{N}$ with $N' \subset N$, each $v \in \mathcal{G}^N$, and each $x \in \varphi(v)$, we have $r^x_{N'}(v) \in \mathcal{G}^{N'}$ and $x_{N'} \in \varphi(r^x_{N'}(v))$, where $r^x_{N'}(v)$, the 'complement reduced game of v relative to N' and x,' is defined by setting, for each $S \subseteq N'$ (Moulin actually defines $r^x_{N'}(v)(N') \equiv \sum_{N'} x_i$; however, in the presence of *Pareto-optimality*, stated below, this definition is equivalent to that of ours), $r^x_{N'}(v)(S) \equiv v(S \cup (N \backslash N')) - \sum_{N \backslash N'} x_i$.

Second, given a proposed payoff vector $x \in \mathbb{R}^N$, in the reduced game of v relative to $N' \subset N$ and x, the worth of a coalition $S \subset N'$ is computed under the assumption that S can secure the cooperation of any subgroup S' of $N \backslash N'$, provided each member of S' receives his component of x. After these payments are made, what remains for S is the difference $v(S \cup S') - \sum_{S'} x_i$. Maximizing behavior on the part of S involves finding $S' \subseteq N \backslash N'$ for which this difference is maximal.

Max consistency: The definition differs from that of *complement consistency* in that the 'max reduced game of v relative to N' and x,' is defined by setting $r^x_{N'}(v)(N') \equiv v(N) - \sum_{N/N'} x_i$, and for each $S \subset N'$, $r^x_{N'}(v)(S) \equiv \max_{S' \subseteq N \backslash N'} \{v(S \cup S') - \sum_{S'} x_i\}$.

Our third main definition of a consistency notion is as follows. Let φ be a *single-valued* solution and let $v \in \mathcal{G}^N$. In calculating the worth of a coalition $S \subseteq N'$ in the reduced game of v relative to $N' \subset N$ *and the solution* φ, we require S to cooperate with the complement of N' (as in the definition of *complement consistency*); this cooperation is assumed to be feasible provided the members of $N \backslash N'$ are paid what φ would recommend for them in the subgame of v faced by the group $S \cup (N \backslash N')$. That is, we imagine the disappearance pure and simple of the group $N' \backslash S$ and we ask what should S receive in total in the subgame $v_{S \cup (N \backslash N')}$? The suggested answer is the difference $v(S \cup (N \backslash N')) - \sum_{N \backslash N'} \varphi_i(v|_{S \cup (N \backslash N')})$. For this calculation to be meaningful, φ should be *single valued*, which is why we limited our attention to that case.

Self-consistency: For each pair N, N' of elements of $\mathcal{N}$ with $N' \subset N$, and each $v \in \mathcal{G}^N$, we have $r^\varphi_{N'}(v) \in \mathcal{G}^N$ and $x_{N'} = \varphi(r^\varphi_{N'}(v))$, where $r^\varphi_{N'}(v)$, the 'self-reduced game of v relative to N' and φ,' is defined by setting, for each $S \subseteq N'$, $r^\varphi_{N'}(v)(S) \equiv v(S \cup (N \backslash N')) - \sum_{N \backslash N'} \varphi_i(v|_{S \cup (N \backslash N')})$.

On the domain of convex games, a number of interesting logical relations hold between these properties and others (Hokari and van Gellekom, 2002).

Theorem 9 (Tadenuma, 1992) *On the domain of TU games whose core is nonempty, the core is the only solution satisfying individual rationality and complement consistency.* (It may be puzzling at *Pareto-optimality* does not appear in this theorem. This is because *individual rationality* can be seen as a 'one-player' optimality property. This property is lifted (the concept of lifting is described in the section?) by the solution from one-player games (which are in the domain). Lifting also occurs with some of the alternative definitions of *consistency* discussed later.)

Theorem 10 (Sobolev, 1975) *On the domain of all TU games, the prenucleolus is the only single-valued solution satisfying Pareto-optimality, anonymity, invariance under common rescaling of utilities, and max consistency.*

(Sobolev does not have an optimality property as he uses a slightly different definition of the reduced game.)

Orshan (1994) and Hokari (2005) investigate the implications of dropping *anonymity*.

Theorem 11 (Peleg, 1986) *On the domain of TU games whose core is nonempty, the core is the only solution satisfying individual rationality, super-additivity, and max consistency.*

Theorem 12 (Hart and Mas-Colell, 1989) *The Shapley value is the only value satisfying Pareto-optimality, symmetry, invariance under rescaling of utilities, and self-consistency.*

Non-transferable Utility Games

A *non-transferable utility game*, an *NTU game* in short, is a list of sets $V \equiv (V(S))_{S \subseteq N}$, where for each $S \subseteq N$, $V(S) \subset \mathbb{R}^S$ represents the set of payoff vectors achievable by S. A TU game can be represented as an NTU game in which each $V(S)$ is a hyperplane normal to a vector of ones. A *hyperplane game* is an NTU game such that each $V(S)$ is defined by a hyperplane. Here, the normal vector can be any positive vector. The notion of a *convex game* has been generalized in several different ways. In a *bargaining game*, there exists a 'disagreement point' $d \in V(N)$ such that for each $S \neq N$, $V(S)$ is the comprehensive hull of d_S.

Most of the solutions and values that were first defined for TU games have been extended to domains of NTU games, but that has often caused complications, both conceptual and technical. A victim has often been *single valuedness*. Also, characterizations obtained for the TU case have not always been extendable to the NTU case. Let $\mathcal{W}^N$ be the domain of all NTU games. Let $V \in \mathcal{W}^N$.

- The *core* selects the set of vectors $x \in \mathbb{R}^N$ such that $x \in V(N)$ and there is no $S \subseteq N$ and $y \in V(S)$ such that $y \geq x_S$. A counterpart of the condition that was shown to be necessary and sufficient for the core of a TU game to be nonempty can be formulated, but here it is only sufficient (Scarf, 1967). A generalization is due to Billera (1970). A domain of convex games is covered by Greenberg (1985). A necessary and sufficient condition for nonemptiness is given by Predtetchinski and Herings (2004).

Several characterizations of the core have been developed. Keiding's (1986) is based on *anti-monotonicity*: given two games V and V' such that for each $S \subset N$, $V'(S) \subseteq V(S)$, and $V'(N) = V(N)$, then $\varphi(V') \subseteq \varphi(V)$. Other characterizations by Peleg (1985) and Tadenuma (1992) are based on NTU versions of *max consistency* and *complement consistency*, respectively.

Recall that a 'core extension' is a solution that coincides with the core when the core is nonempty. Such an extension is proposed and characterized by Keiding and Pankratova (2010).

- The *bargaining set* is defined in the same way as in the TU case. A sufficient condition for nonemptiness of the bargaining set of NTU games is due to Vohra (1991). This condition is not necessary (Chang and Lee, 1993).
- Shapley's objective in his fundamental paper (1969) was to extend his TU value to the NTU case. In order to solve an NTU game, his strategy was as follows: (1) to associate with it a TU game by supposing utility transfers to be feasible at some rates, (2) to solve this TU game by applying the Shapley value, and (3) to verify that the solution outcome of the TU game is feasible in the original game without in fact performing any utility transfers. Here is the formal definition of the *NTU Shapley solution*. Let $\lambda \in \mathbb{R}^N_{++}$ and v_λ be the TU game defined by setting for each $S \subseteq N$, $v_\lambda(S) := \max\{\lambda \cdot x | x \in V(S)\}$. Then the solution selects for V those payoff vectors x for which there is $\lambda \in \mathbb{R}^N_{++}$ such that for each $i \in N$, $\lambda_i x_i = Sh_i(v_\lambda)$.

A characterization of the NTU Shapley solution is developed by Aumann (1985) based on a list of axioms that includes the next two:

Conditional additivity says that if x and y are two efficient vectors chosen for each of two NTU games, and their sum $x + y$ is efficient for the sum of the two games, then it should be chosen for that game.

Contraction independence says that if x is chosen for a game and the feasible set for the grand coalition shrinks the feasible sets for other coalitions remaining unchanged, and x is still feasible for the grand coalition, then x should be chosen for the new game.

The question had been left open whether *contraction independence* was independent of the other axioms. The answer is negative (Peleg et al., 2012). A family of weighted NTU Shapley solutions is defined and characterized by Levy and McLean (1991).

- The *Kalai–Samet payoff-configuration value* (Kalai and Samet, 1985) selects a payoff configuration $(x^S)_{S \in 2^N}$ that is constructed recursively as follows: For each $i \in N$, let $t^{\{i\}}$ be the maximal payoff that he can obtain in $V(\{i\})$ and $x^{\{i\}} \equiv t^{\{i\}}$. For each two-player coalition $\{i, j\}$, let $x^{\{i,j\}} \equiv (t^{\{i\}} + t^{\{i,j\}}, t^{\{j\}} + t^{\{i,j\}})$, where $t^{\{i,j\}}$ is chosen so as to achieve efficiency in $V(\{i, j\})$. For each three-player coalition $\{i, j, k\}$, let $x^{\{i,j,k\}} \equiv (t^{\{i\}} + t^{\{i,j\}} + t^{\{i,k\}} + t^{\{i,j,k\}}, t^{\{j\}} + t^{\{i,j\}} + t^{\{j,k\}} + t^{\{i,j,k\}}, t^{\{k\}} + t^{\{i,k\}} + t^{\{j,k\}} + t^{\{i,j,k\}})$, where $t^{\{i,j,k\}}$ is chosen so as to achieve efficiency in $V(\{i, j, k\})$. For larger coalitions S, $x^S \in \mathbb{R}^S$ is defined in a similar manner.

Weighted versions of the solution can be defined: Given a weights vector $\lambda \in \mathbb{R}^N_{++}$, the associated payoff-configuration solution picks the payoff-configuration constructed as follows: For each $i \in N$, let $x^{\{i\}}$ be the maximal payoff that he can obtain in $V(\{i\})$ and $t^{\{i\}} \equiv \lambda_i x^{\{i\}}$. For each two-player coalition $\{i, j\}$, let

$$x^{\{i,j\}} \equiv \left(\frac{t^{\{i\}} + t^{\{i,j\}}}{\lambda_i}, \frac{t^{\{j\}} + t^{\{i,j\}}}{\lambda_j} \right)$$

where $t^{\{i,j\}}$ is chosen so as to achieve efficiency in $V(\{i, j\})$. For each three-player coalition $\{i, j, k\}$, let

$$x^{\{i,j,k\}} \equiv \left(\frac{t^{\{i\}} + t^{\{i,j\}} + t^{\{i,k\}} + t^{\{i,j,k\}}}{\lambda_i}, \frac{t^{\{j\}} + t^{\{i,j\}} + t^{\{j,k\}} + t^{\{i,j,k\}}}{\lambda_j}, \frac{t^{\{k\}} + t^{\{i,k\}} + t^{\{j,k\}} + t^{\{i,j,k\}}}{\lambda_k} \right)$$

where $t^{\{i,j,k\}}$ is chosen so as to achieve efficiency in $V(\{i, j, k\})$. For larger coalitions S, $x^S \in \mathbb{R}^S$ is chosen in a similar manner.

Characterizations of the Kalai–Samet value and of their weighted versions are available (Kalai and Samet, 1985; Hart and Mas-Colell, 1989; Chun, 2004; de Clippel et al., 2004). Kalai and Samet's (1985) characterization is based on the

following direct generalization of *coalitional-worth-monotonicity* for the TU case:

Coalitional monotonicity says that if $V(T) \subset V'(T)$ and for all $S \neq T$, $V(S) = V'(S)$, then $\varphi_T(V) \leq \varphi_T(V')$.

Hart and Mas-Colell's (1989) characterization is based on an NTU version of *self-consistency*.

- The *Harsanyi payoff-configuration solution* selects those payoff configurations $(\gamma^S)_{S \in 2^N}$ for which there is $\lambda \in \mathbb{R}^N_{++}$ such that γ^N maximizes $\sum_{i \in N} \lambda_i x_i$ over $V(N)$, and $(\gamma^S)_{S \in 2^N}$ is selected by the corresponding weighted Kalai–Samet payoff-configuration value.

A characterization of the Harsanyi payoff-configuration solution is also available (Hart, 1985). Remarkably, it only involves rewriting the axioms imposed by Aumann (1985) in his characterization of the NTU Shapley solution so that they be applicable to payoff-configuration solutions.

The *Harsanyi–Shapley solution* is defined as the intersection of the Harnanyi solution and the NTU Shapley solution (Chang and Hwang, 2001, 2003).

- The *Maschler–Owen value for hyperplane games.* Given a hyperplane game H, the Maschler–Owen value selects the average of the vectors of contributions corresponding to the various orders in which players may arrive. Since $H(N)$ is a hyperplane, this average is feasible and efficient.

Results on hyperplane games are due to Maschler and Owen (1989), Owen (2004), and Bhattacharya and Ziad (2006).

The *Maschler–Owen solution* is defined recursively by constructing hyperplane games and applying the Maschler–Owen value to them:

1. For each $i \in N$, let $H(\{i\}) := V(\{i\})$.
2. Let $S \subseteq N$ and suppose that for each $T \subset S$, $H(T)$ has been defined. Then $H(S)$ is chosen so that the Maschler–Owen value for the resulting hyperplane game for S is feasible and efficient for $V(S)$.

Characterizations of the Maschler–Owen solution are also available (de Clippel et al., 2004; Hart, 2005).

- The *compromise value* selects the maximal point on the line passing through two points derived from the game, a 'utopia' vector and a derived vector of lower bounds (Borm et al., 1992). It is defined on the subdomain of games for which the latter vector is dominated by the former, the latter belongs to the feasible set of the grand coalition and the former is not dominated by any point in this set.

It can be seen as an extension of the τ-value to NTU games as well as an extension of the Kalai–Smorodinsky (KS) solution for bargaining games.

Characterizations of the compromise value can be obtained by extending the characterizations of the τ-value and KS solution (Borm et al., 1992; Otten et al., 1996).

- The *MC-value for monotonic NTU games* (Otten et al., 1998) selects the efficient point on the line through the origin (games are 0-normalized), and the sum of the vectors of contributions corresponding to the various orders in which players may arrive.

The value coincides with the Shapley value on the subdomain of TU games, with the KS solution on the subdomain of bargaining games, and with the Owen–Maschler value on the subdomain of hyperplane games.

Two axiomatic characterizations of the MC value are available (Otten et al., 1998).

- The *procedural value* (de Clippel, 2007) is defined recursively by constructing bargaining games and applying the Raiffa solution to them. For each two-player coalition, the Raiffa solution is applied. For each three-player coalition, let a_i be the maximal payoff for player i in $V(\{i, j, k\})$ given that other players j and k get what the Raiffa solution selects for $V(\{j, k\})$. Then the Raiffa solution is applied to select a payoff vector from $V(\{i, j, k\})$ assuming that the disagreement point is the simple average of a_i, a_j, and a_k. The bargaining games for larger coalitions are defined in a similar manner.

The resulting value coincides with the Shapley value on the subdomain of TU games, with the Raiffa solution on the subdomain of bargaining games, and with the Owen–Maschler value on the subdomain of hyperplane games.

Extensions of the Base TU Model

Various enrichments of the base TU model have been formulated and for many of these extensions, a number of the solutions and values developed for the base model have been extended and often characterized along the lines of characterizations they had been given for the base model.

- In *games with a coalition structure* a partition of the player set – the coalition structure – is added to the model (Aumann and Drèze, 1975). Payoffs can be obtained by means of a two-step process, by first inducing a game among the components of the partition, and then dividing what each component has been assigned among its members. Four proposals have been made, based on the Shapley value and the Banzhaff value. They differ in the order in which the two values are applied. A characterization of a value due to Owen has been developed (Hamiache, 1999, 2006).

Studies of this class of games are numerous. A generalization of the model is when an ordered list of coalition structures is added, each element in the list refining the previous one, with the finest possible partition (which consists of all one-player coalitions) and the coarsest partition (which consists of the grand coalition only) being included. These are *games with levels of participation* (Winter, 1989).

- In a *game in partition function form*, the worth of a coalition depends on how the complementary coalition is partitioned (Lucas and Thrall, 1977). Indeed, what it can achieve may depend on the activities undertaken by the other groups that have formed. Such a game is sometimes called a *game with externalities* (de Clippel and Serrano, 2008; Dutta et al., 2010). Characterizations of a version of the Shapley value for this domain of games along the lines of Theorem 3 are

due to Myerson (1977) and Pham Do and Norde (2007). The consensus value has also been adapted to this setting and a characterization developed by Y. Ju (2007).

- A *game with a graph structure* includes a graph structure on the player set. A coalition can obtain its worth as specified in the game only if its members form a connected component of the graph. A characterization of a variant of the Shapley value is due to Myerson (1977). A *tree game* is a special case (Maschler et al., 2010; Mishra and Talman, 2010).
- For a *game with precedence constraints* (Faigle and Kern, 1992; Grabisch and Sudhölter, 2012), there is a partial order on the set of coalitions. A coalition is feasible only if it contains all players preceding a member of it according to the partial order.
- In a *game with a permission structure*, the player set is equipped with an additional structure meant to capture restrictions on who can associate with whom (Gilles et al., 1992). It takes the form of a correspondence from the set of players into itself that is required to satisfy certain properties: it associates with each player a set of 'successors.' This information can be used in several ways. One possibility is that a coalition forms only if each of its members (except for the 'top player') has at least one predecessor who belongs to it. Alternatively, a coalition forms only if each of the predecessors of each of its members belong to it. van den Brink (2010) adapts the Banzhaf value to this setting and develops an axiomatization of it.
- In a *game with restricted cooperation* (the expression 'partially defined games' has also been used) not all coalitions can form, so the specification of a game includes only the worths of a subclass of subsets of the player set. Characterizations of versions of the Shapley value and of the core on the basis of, mainly, a linearity axiom in the first case and a consistency axiom in the second case, have been developed (Faigle, 1989).
- In a *game with upper bounds*, an upper bound on how much certain coalitions can be assigned in total is specified. A notion of 'truncated core' has been defined for such games and characterized along the lines of Theorem 11 (Carpente et al., 2010).
- In a *multi-choice game*, each player can participate at a finite number of different levels (Hsiao and Raghavan, 1993). The notion of a *bi-cooperative game* is closely related: each player has two options, to participate in a positive way or to participate in a negative way (Bilbao et al., 2008). In a *fuzzy game*, each player's participation level is a real number between 0 (non-cooperation) and 1 (full cooperation). A fuzzy coalition is a profile of players' participation levels. A fuzzy game specifies for each fuzzy coalition its worth (Hwang, 2007; J. Liu, and X. Liu, 2012).
- In a *dynamic TU games* (Kranich et al., 2005), players face a finite sequence of exogenously specified TU games. Each player has a time-separable utility function defined over sequences of payoffs. There are several ways to define a core-like solution for this model.

The final class of games is defined so as to incorporate uncertainty.

- For an *interval games*, the worth of a coalition, instead of being a well-defined number, is specified as an interval in the real line, no probabilistic information being given on the relative likelihood of each point in the interval (Alparslan-Gök et al., 2009).

This article is a revision of the previous edition article by R.E. Slavin, E.A. Hurley and A.M. Chamberlain, volume 4, pp. 2756–2761, © 2001, Elsevier Ltd.

Abstract

In cooperative learning, students work in small groups to help one another learn academic objectives. This article describes the theoretical basis for cooperative learning, and the evidence base for common pragmatic approaches. It concludes that cooperative learning works best for increasing achievement when student teams have group goals they can only achieve if all group members are gaining in learning, so that they focus on teaching and learning from each other rather than merely completing a group task.

Cooperative learning refers to instructional methods teachers use to organize students into small groups, in which students work together to help one another learn academic content. Cooperative learning methods are extensively researched, and under certain well-specified conditions they are known to substantially improve student achievement in most subjects and grade levels. Yet the structured forms of cooperative learning that have proven to be effective are not used as often as more informal forms. Further, there remains considerable debate about the theoretical basis for achievement outcomes of cooperative learning. This article reviews and describes widely used, practical forms of cooperative learning, and presents evidence on their effects on academic achievement.

Cooperative learning methods vary widely in their details. Group sizes may be from two to several. Group members may have individual roles or tasks, or they may all have the same task. Groups may be evaluated or rewarded based on group performance or the average of individual performances, or they may simply be asked to work together.

In one form or another, cooperative learning has been used and studied in every major subject, with students from preschool to college, and in all types of schools. There have been hundreds of studies of cooperative learning focusing on a wide variety of outcomes, including academic achievement in many subjects, second language learning, attendance, behavior, intergroup relations, social cohesion, acceptance of classmates with handicaps, attitudes toward subjects, and more (see Johnson and Johnson, 1998; Rohrbeck et al., 2003; Slavin, 1995; Webb, 2008).

Theoretical Perspectives on Cooperative Learning

Although there is a fair consensus among researchers about the positive effects of cooperative learning on student achievement, discussed in this article, there remains a controversy about why and how cooperative learning methods affect achievement and, most importantly, under what conditions cooperative learning has these effects. Different groups of researchers investigating cooperative learning effects on achievement begin with different assumptions and conclude by explaining the achievement effects of cooperative learning in quite different theoretical terms. In earlier work, Slavin (1995) identified motivationalist, social cohesion, cognitive-developmental, and cognitive-elaboration as the four major theoretical perspectives on the achievement effects of cooperative learning.

The motivationalist perspective presumes that task motivation is the single most impactful part of the learning process, asserting that the other processes such as planning and helping are driven by individuals' motivated self-interest. Motivationalist-oriented scholars focus more on the reward or goal structure under which students operate (Slavin, 1995, 2009). Methods derived from this perspective emphasize the use of group goals and individual accountability, meaning that group success depends on the individual learning of all group members (see below). By contrast, the social cohesion perspective (also called social interdependence theory) suggests that the effects of cooperative learning are largely dependent on the cohesiveness of the group. This perspective holds that students help each other learn because they care about the group and its members and come to derive self-identity benefits from group membership (Johnson and Johnson, 1998).

The two cognitive perspectives on cooperative learning focus on the interactions among groups of students, holding that, in themselves, these interactions lead to better learning and thus better achievement.

The alternative perspectives on cooperative learning may be seen as complementary, not contradictory. For example, motivational theorists would not argue that the cognitive theories are unnecessary. Instead, they assert that motivation drives cognitive process, which in turn produces learning (Slavin, 1995). They would argue that it is unlikely over the long haul that students would engage in the kind of explanations to each other found by Webb (2008) and others to be essential to profiting from cooperative activity unless the learning of their teammates is important to them. Similarly, social cohesion theorists might hold that the utility of extrinsic incentives must lie in their contribution to group cohesiveness, caring, and prosocial norms among group members, which could in turn affect cognitive processes.

A simple path model of cooperative learning processes, adapted from Slavin (1995), is diagrammed below. It depicts the main functional relationships among the major theoretical approaches to cooperative learning.

Figure 1 begins with a focus on group goals or incentives based on the individual learning of all group members. That

Figure 1 Integration of theoretical perspectives on cooperative learning effects on learning.

is, the model assumes that motivation to learn and to encourage and help others to learn activates cooperative behaviors that will result in learning. This would include both task motivation and motivation to interact in the group. In this model, motivation to succeed leads to learning directly, and also drives the behaviors and attitudes that lead to group cohesion, which in turn facilitates the types of group interactions that yield enhanced learning and academic achievement. The relationships are conceived to be reciprocal, such that task motivation leads to the development of group cohesion, which may reinforce and enhance task motivation. By the same token, the cognitive processes may become intrinsically rewarding and lead to increased task motivation and group cohesion.

Group Goals and Individual Accountability

Considerable evidence from practical applications of cooperative learning in elementary and secondary schools supports the position that group rewards are essential to the effectiveness of cooperative learning, with one critical qualification. Use of group goals or group rewards enhances the achievement outcomes of cooperative learning, if and only if the group rewards are based on the individual learning of all group members (Slavin, 1995). Most often, this means that team scores are computed based on average scores on quizzes, which all teammates take individually without teammate help. For example, in Student Teams-Achievement Divisions, or STAD (Slavin, 1994), students work in mixed-ability teams to master material initially presented by the teacher. Following this, students take individual quizzes on the material, and the teams may earn certificates based on the degree to which team members have improved over their own past records. The only way the team can succeed is to ensure that all team members have learned, so the team members' activities focus on explaining concepts to one another, helping one another practice, and encouraging one another to achieve. In contrast, if group rewards are given based on a single group product (e.g., the team completes one worksheet or solves one problem), there is little incentive for group members to explain concepts to one another, and one or two group members may do all the work (see Slavin, 1995, 2009).

A review of 99 studies of cooperative learning in elementary and secondary schools that involved durations of at least 4 weeks compared achievement gains in cooperative learning and control groups (Slavin, 1995). Of 64 studies of cooperative learning methods that provided group rewards based on the sum of group members' individual learning, 50 studies (78%) found significantly positive effects on achievement, and none found negative effects (Slavin, 1995). The median effect size for these 64 studies was $d = +0.32$ (32% of a standard deviation separated cooperative learning and control treatments).

In contrast, studies of methods that used group goals based on a single group product or provided no group rewards found few positive effects, with a median effect size of only $d = +0.07$. Comparisons of forms of cooperative learning with and without group rewards within the same studies found similar patterns; group goals based on the sum of individual learning performances were necessary to the instructional effectiveness of the cooperative learning models (e.g., Fantuzzo et al., 1990; Fantuzzo et al., 1989).

Why are group goals and individual accountability so important? To understand this, consider the alternatives. In some forms of cooperative learning, students work together to complete a single worksheet or to solve one problem. In such methods, there is little reason for more able students to take the time to explain what is going on to their less able groupmates or to ask their opinions. When the group task is to *do* something, rather than to *learn* something, the participation of less able students may be seen as interference rather than help. It may be easier in this circumstance for students to give each other answers than to explain concepts or skills to one another. More aggressive students may dominate the group, and others may avoid participating, letting others do the work (and the learning).

When the group's task is to ensure that every group member *learns* something, it is in the interest of every group member to spend time explaining concepts to his or her groupmates, and to ask groupmates for explanations and help in understanding the topic of study. Studies of student behavior within cooperative groups have found that the students who gain most from cooperative work are those who give and receive elaborated explanations (Webb, 1985, 2008). In contrast, giving and receiving answers without explanations were *negatively*

related to achievement gain. Group goals and individual accountability motivate students to give elaborated explanations and to take one another's learning seriously, instead of simply giving answers.

Research on Alternative Pragmatic Approaches to Cooperative Learning

Research and development over the years have led to the creation and evaluation of several practical approaches to cooperative learning. The most widely used and extensively researched of these programs are described in the following sections. These sections discuss cooperative learning studies that met the standards of the Best Evidence Encyclopedia (BEE; www.bestevidence.org) in reading and math. Inclusion in the BEE reviews requires a well-matched control group, a duration of at least 12 weeks, and measures not inherent to the treatment (see Slavin, 2008). Mean effect sizes are computed weighting by sample size. Full reports of the BEE reviews are published for elementary reading by Slavin et al. (2009b), for secondary reading by Slavin et al. (2008), for elementary math by Slavin and Lake (2008), and for secondary math by Slavin et al. (2009a).

Cooperative learning methods fall into two main categories. One set, *Structured Team Learning*, involves rewards to teams based on the learning progress of their members, and individual accountability, which means that team success depends on individual learning, not group products. A second set, *Informal Group Learning Methods*, includes methods more focused on social dynamics, projects, and discussion than on mastery of well-specified content.

Structured Team Learning Methods

Student Team Learning

Student Team Learning (STL) techniques were developed and researched at Johns Hopkins University (see Slavin, 1994, 1995). More than half of all experimental studies of practical cooperative learning methods involve STL methods.

All cooperative learning methods share the idea that students work together to learn and are responsible for one another's learning as well as their own. STL methods also emphasize the use of team goals and team success, which can only be achieved if all members of the team learn the objectives being taught.

Two concepts are central to all STL methods: *team rewards* and *individual accountability*. Using STL techniques, teams earn certificates or other team rewards if they achieve above a designated criterion. *Individual accountability* means that the team's success depends on the individual learning of all team members. This focuses the activity of the team members on explaining concepts to one another and making sure that everyone on the team is ready for a quiz or other assessment that they will take without teammate help.

Four principal Student Team Learning methods have been extensively developed and researched. Two are general cooperative learning methods adaptable to most subjects and grade levels: STAD and Teams–Games–Tournament (TGT). The remaining two are comprehensive curriculums designed for use in particular subjects at particular grade levels: Team-Assisted Individualization (TAI) for mathematics in years 3–6 and Cooperative Integrated Reading and Composition (CIRC) for reading and writing instruction in grades 3–5. Middle school adaptations of CIRC are called Student Team Reading and The Reading Edge.

Student Teams-Achievement Divisions

In STAD (Slavin, 1994), students are assigned to four-member learning teams mixed in performance level, sex and ethnicity. The teacher presents a lesson, and the students work within their teams to make sure that all team members have mastered the lesson. Finally, all students take individual quizzes on the material, at which time they may *not* help one another.

Students' quiz scores are compared to their own past averages, and points are awarded based on the degree to which students meet or exceed their own earlier performances. These points are then summed to form team scores, and teams that meet certain criteria earn certificates or other rewards. The whole cycle of activities, from teacher presentation to team practice to quiz, usually takes three to five class periods.

STAD has been used in a wide variety of subjects, including mathematics, language arts, and social studies. It has been used from grade 2 through college. STAD is most appropriate for teaching well-defined objectives, such as mathematical computations and applications, language usage and mechanics, geography and map skills, and science facts and concepts.

Numerous studies of STAD have found positive effects of the program on traditional learning outcomes in math, language arts, science, and other subjects (Barbato, 2000; Mevarech, 1985; Reid, 1992; Slavin, 1995; Slavin and Karweit, 1984). Across 11 comparisons that met BEE inclusion criteria, nine of which used random assignment to conditions, the sample-size-weighted effect size was +0.14. These studies involved a total of more than 4000 students in grades 3–12.

Teams–Games–Tournament

TGT (Slavin, 1994) uses the same teacher presentations and teamwork as in STAD, but replaces the quizzes with weekly tournaments. In these, students compete with members of other teams to contribute points to their team score. Students compete at three-person tournament tables against others with a similar past record in mathematics. Table assignments rotate to keep the competition fair. The winner at each tournament table brings the same number of points to his or her team, regardless of which table it is; this means that low achievers (competing with other low achievers) and high achievers (competing with other high achievers) have equal opportunity for success. As in STAD, high-performing teams earn certificates or other forms of team rewards. TGT is appropriate for the same types of objectives as STAD. Several studies of TGT have found positive effects on achievement in math, science, and language arts (Slavin, 1995).

Team-Assisted Individualization

TAI (Slavin et al., 1986) shares with STAD and TGT the use of four-member mixed-ability learning teams and certificates for high-performing teams. However, where STAD and TGT use a single pace of instruction for the class, TAI combines cooperative learning with individualized instruction. Also, where STAD and TGT apply to most subjects at grade levels, TAI is specifically designed to teach mathematics to students in grades 3–6 (or older students not ready for a full algebra course). Across five comparisons (2 randomized) involving almost 3000 students, the sample-size-weighted effect size for TAI was +0.19.

Cooperative Integrated Reading and Composition

A comprehensive program for teaching reading and writing in the upper-elementary grades is called CIRC (Stevens et al., 1987). In CIRC, teachers use reading texts and reading groups, much as in traditional reading programs. However, all students are assigned to teams composed of two pairs from two different reading groups. While the teacher is working with one reading group, the paired students in the other groups are working on a series of cognitively engaging activities, including reading to one another, making predictions about how narrative stories will come out, summarizing stories to one another, writing responses to stories, and practicing spelling, decoding, and vocabulary. Students work as a total team to master main idea and other comprehension skills. During language arts periods, students engage in writing drafts, revising and editing one another's work, and preparing for publications of team books.

In most CIRC activities, students follow a sequence of teacher instruction, team practice, team preassessments, and quizzes. That is, students do not take the quiz until their teammates have determined that they are ready. Certificates are given to teams based on the average performance of all team members on all reading and writing activities.

Research on CIRC and similar approaches has found positive effects in upper-elementary and middle school reading (Stevens and Durkin, 1992; Stevens et al., 1987). CIRC has been adapted as the upper-elementary and middle school component of the Success for All comprehensive reform model and is currently disseminated under the name *Reading Wings* by the Success for All Foundation. Across 13 studies (one of which was randomized) involving more than 14 000 students in grades 1–8, the weighted mean effect size was +0.27.

Peer-Assisted Learning Strategies

Peer-Assisted Learning Strategies (PALS) is a dyadic learning approach in which pairs of children take turns as teacher and learner. The children are taught simple strategies for helping each other, and are rewarded based on the learning of both members of the pair. Research on PALS in elementary and middle school math and reading has found positive effects of this approach on student achievement outcomes (e.g., Calhoon, 2005; Calhoon et al., 2006; Fuchs et al., 2001; Fuchs et al., 1999; Mathes and Babyak, 2001). Positive effects of a similar program called Classwide Peer Tutoring (Greenwood et al., 1989) have also been found, and another similar approach has been found to be effective in two Belgian studies (Van Keer and Verhenge, 2005, 2008). Across 11 reading studies, five of which used random assignment, the weighted effect size was +0.30. There were a total of about 1700 students across the studies. Three randomized studies of PALS in math, involving more than 600 students, found a weighted mean effect size of +0.09.

IMPROVE

IMPROVE (Mevarech, 1985) is an Israeli mathematics program that uses cooperative learning strategies similar to those used in *STAD* but also emphasizes teaching of metacognitive skills and regular assessments of mastery of key concepts and reteaching of skills missed by many students. Studies of *IMPROVE* have found positive effects on the mathematics achievement of elementary and middle school students in Israel (Mevarech and Kramarski, 1997; Kramarski et al., 2001). Across three studies (one randomized) involving almost 700 Israeli middle schoolers, the weighted mean effect size was +0.52.

Informal Group Learning Methods

Jigsaw

Jigsaw was originally designed by Elliot Aronson et al. (1978). Slavin (1994) developed a modification of Jigsaw at Johns Hopkins University and then incorporated it in the STL program. In this method, called Jigsaw II, students work in four- or five-member teams as in TGT and STAD. Instead of each student being assigned a particular section of text, all students read a common narrative, such as a book chapter, a short story, or a biography. However, each student receives a topic (such as 'climate' in a unit on France) on which to become an 'expert.' Students with the same topics meet in expert groups to discuss them, after which they return to their teams to teach what they have learned to their teammates. Then students take individual quizzes, which result in team scores based on the improvement score system of STAD. Teams that meet preset standards earn certificates. Jigsaw is primarily used in social studies and other subjects where learning from text is important (Mattingly and Van Sickle, 1991).

Learning Together

David Johnson and Roger Johnson at the University of Minnesota developed the Learning Together models of cooperative learning (Johnson and Johnson, 1998). The methods they have researched involve students working on assignment sheets in four- or five-member heterogeneous groups. The groups hand in a single sheet and receive praise and rewards based on the group product. Their methods emphasize team-building activities before students begin working together and regular discussions within groups about how well they are working together. Numerous relatively brief experiments have shown positive effects of these approaches (see Johnson and Johnson, 1998).

Group Investigation

Group Investigation, developed by Shlomo Sharan and Yael Sharan (1992) at the University of Tel-Aviv, is a general classroom organization plan in which students work in small groups using cooperative inquiry, group discussion, and cooperative planning and projects. In this method, students form their own two- to six-member groups. After choosing subtopics from a unit being studied by the entire class, the groups further break their subtopics into individual tasks and carry out the activities necessary to prepare group reports. Each group then makes a presentation or display to communicate its findings to the entire class. A study in Israel by Sharan and Shachar (1988) found positive effects of Group Investigation on achievement in language and literature.

Directions for Further Research and Development

Cooperative learning occupies a strange place in educational research and practice. On one hand, it is universally known and almost universally admired. Most researchers and educators have positive attitudes toward cooperative learning and believe it to be effective for many outcomes (see Antil et al., 1998). Yet the forms of cooperative learning that have been found to be effective, especially for academic achievement outcomes, remain at the edge of practice, perhaps in a state of permanent innovation. That is, cooperative learning has never disappeared but has never become common practice.

More research is needed on how and why cooperative learning works, and how it may be made to work better. Studies comparing conditions under which dyads may be more or less effective than groups of four might be interesting, and much more needs to be known about specific means of helping students learn and use effective groupwork strategies and metacognitive learning strategies. Further explorations are needed to understand how and under what conditions group goals and individual accountability affect learning outcomes of cooperative learning. There is a need to develop approaches integrating cooperative learning activities with various types of technology, both classroom technologies such as interactive whiteboards and traditional computers.

Although there is already a great deal of research on cooperative learning, there is still much room for theoretical and practical advances. Cooperative learning is so different from ordinary teaching that it opens a vast set of questions and possibilities that are far from being exhausted.

Conclusion

Research on cooperative learning over a 40-year period has found that under a set of well-defined circumstances, students working in structured small groups can learn significantly better than can students working in traditional classrooms. Positive learning outcomes depend on the use of programs in which students have group goals and are individually accountable for learning the content the group is engaged with. Outcomes are generally enhanced if students are taught specific ways of working in groups dealing with both metacognitive and social strategies for making best use of the group learning setting. Providing sufficient training and follow-up to ensure high-quality implementation is also essential.

Although important research continues to appear, the basic principles of cooperative learning have been established for many years, and there are many pragmatic training programs available. Yet cooperative learning remains an innovative approach familiar to most teachers but not used as a standard part of instruction. Most school principals can lead a visitor to a teacher enthusiastically using cooperative learning programs that are demonstrably working for the students, yet the visitor will note on the way to see that teacher the many fellow-teachers in the same school who are teaching students in rows, or using informal forms of groupwork without group goals or individual accountability, which research has rarely supported. Studies of actual use of cooperative learning (e.g., Antil et al., 1998) find that most use of cooperative learning is informal, and does not incorporate the elements that research has repeatedly found to be essential.

There remains a need for development and evaluation of cooperative learning programs that solve key problems of teaching and learning in all subjects and grade levels, and for continued research to identify the conditions under which cooperative learning is most likely to be effective. The greatest need at this point, however, is to develop and evaluate forms of cooperative learning that can be readily and successfully adopted by schools on a large scale, and to study the impediments to successful adoption of cooperative strategies. After 40 years of research and application, cooperative learning still has much more to contribute to students' learning.

Abstract

Coping, a basic process integral to adaptation and survival, depicts how people detect, appraise, deal with, and learn from stressful encounters. Decades of research in the social and medical sciences have examined coping in many domains across the life span. Mainstream research, focusing on measurement of individual differences and correlates of coping, suggests that coping can buffer or exacerbate the effects of stress on mental and physical health and functioning, as well as directly shape the development of psychopathology and resilience. New directions include construction of developmental theories, measurement schemes that augment self-report questionnaires, and designs that capture coping processes.

Introduction

Coping is an adaptive process, integral to functioning and development. At its core, coping depicts how people detect, appraise, deal with, and learn from actual and anticipated stressful encounters. The processes used to accomplish these tasks arise from many levels, and so coping is an organizational construct that includes a tightly integrated system of neurophysiological, attentional, emotional, motivational, behavioral, cognitive, social, and interpersonal processes. Because coping refers to how individuals deal with actual stressors on the ground in real time, a major focus of the area has been the identification of different 'ways of coping.' A wide variety of potentially adaptive ways have been studied, including instrumental action, problem-solving, support-seeking, reappraisal, accommodation, information-seeking, emotion expression and regulation, and negotiation; an even greater number of potentially maladaptive ways have also been identified, including avoidance, escape, rumination, denial, helplessness, passivity, confusion, concealment, isolation, self-pity, dependency, anxiety amplification, self-blame, other-blame, confrontation, venting, and aggression.

Considering the building blocks of the area, individual differences in these ways of coping have been the target of tens of thousands of studies, examining their links to physical and mental functioning, health, and psychopathology across the life span and in a wide variety of domains, including work, family, parenting, medicine, school, peers, bereavement, unemployment, aging, as well as nonnormative life events, like accidents, crime victimization, cultural upheaval, economic downturns, war, and relocation. Because these kinds of stressful life events comprise a host of changing challenges, threats, and losses, people typically employ many different coping strategies to deal with them, as both events and coping transactions unfold over time. People's coping strategies are shaped by their appraisals of the stressful situation, their personal resources (such as intelligence or optimism), and the social resources they can access (such as instrumental help or emotional support). Although findings are not always clear or conclusive, in general, research suggests that the ways that people cope can make a material difference to how stressful encounters are resolved and their short- and long-term consequences. For this reason, coping has been the target of intervention efforts across a wide spectrum of life stresses and events. This work suggests that coping is malleable and responsive to direct instruction, reappraisal of events, promotion of personal resources, and the provision of social supports.

Mainstream research, focusing largely on the measurement and correlates of coping, has been criticized for lack of consensus about core ways of coping, for overreliance on self-reports, and for use of cross-sectional designs. Developmental conceptualizations that link coping to regulation as well as process-oriented research in both naturalistic and lab settings, using a variety of assessments (interviews, narratives, daily reports, observations) and examining intraindividual relations and change over time, promises to reinvigorate the area.

Definitions

Given the current prominence of transactional views, coping is often defined as "constantly changing cognitive and behavioral efforts to manage specific external and/or internal demands that are appraised as taxing or exceeding the resources of the person" (Lazarus and Folkman, 1984: 141). Coping incorporates processes from many levels. It reflects evolution; humans come prepared to recognize and react to environmental demands in ways that promote survival. Coping has a tightly integrated physiological, psychological, and social basis. Many features of psychological functioning, such as emotions, motivation, attention, volition, cognition, and communication, are organized in ways that allow them to contribute to coping. For example, emotions signal and organize interactions of adaptive significance. Many aspects of social relationships and cultural systems also contribute to coping. For example, attachment relationships provide a safe haven of protection during times of distress.

Coping has both normative and individual difference features. Normatively, humans are prepared to cope adaptively. In fact, stress is likely necessary for the kinds of sustained constructive engagement that facilitate development. However, human responsiveness to stress can also represent

a vulnerability; too much stress can overwhelm and damage people. In addition, there are enormous differences in how physiological, psychological, social, and cultural resources for coping are distributed across individuals and sociocultural groups.

Finally, coping is a process that unfolds over time. Coping takes real time; any specific stressful transaction involves sequences of moment-to-moment interactions. Coping also takes place over episodic time; dealing with demands encompasses a protracted series of specific real-time transactions. As noted by White, "Described not inappropriately in military metaphors, adaptation often calls for delay, strategic retreat, regrouping of forces, abandoning of untenable positions, seeking fresh intelligence, and deploying new weapons" (White, 1974: 50). Coping also changes over developmental time: the means of coping as well as the personal and resources brought to bear during coping efforts show radical changes and qualitative shifts from birth and across the life span (Aldwin, 2007; Skinner and Zimmer-Gembeck, 2007).

Given its complexity and centrality to adaptation, it is not surprising that coping has been approached from a wide range of theoretical perspectives. It has been defined as a specific person–context transaction, personality in action under stress, a repertoire of strategies, a hierarchically organized set of ego processes, an indicator of competence, a function of emotion, an outcome of temperament, an expression of stress physiology, and a quality of action regulation. Although it has been suggested that coping is primarily a manifestation of other phenomena, most researchers vigorously argue that coping processes have an independent causal status. More specifically, they maintain that coping makes a material difference to how stressful interactions are resolved and is a key factor influencing long-term mental and physical heath, well-being, and development in the face of adversity.

Historical Contexts

Coping did not appear as a term in *Psychological Abstracts* until 1967. Since that time, research has been voluminous. A search of *PsycINFO* on 'coping' from 1967 to 2013 yields about 61 000 entries, marking it as a topic of significant interest to psychologists. Historically, work on coping started well before the 1960s. It has early forerunners in psychoanalytic work on defenses and has been heavily influenced by the study of stress. Work with children and the elderly incorporates a focus on development. Theories have been informed by a host of interventions designed to help people of all ages cope more adaptively with trauma and stressful life events. (For historical overviews, see Lazarus, 1993; Lazarus and Folkman, 1984; Murphy, 1974; Parker and Endler, 1996; Snyder, 1999.)

Coping and Defense

The concept of defense, as it first appeared in psychology in the early writings of Freud (1894–1962), referred to psychological mechanisms (such as repression or projection) used to protect the psyche from disturbing thoughts and emotions, mainly by distorting reality or removing the distressing material from conscious awareness. These ideas were expanded by Anna Freud (1936/1946) who argued that individuals have particular styles of defense, which are linked to specific forms of psychopathology. This formulation influenced several generations of ego-psychologists (e.g., Haan, 1977; Valliant, 1986; see Cramer, 1998). These theorists argued explicitly for a hierarchical model of ego processes, in which some defenses are more mature than others. For example, Haan (1977) posited a three-tiered taxonomy of ego processes: coping, considered more forward-looking, flexible, largely conscious, and attentive to reality; defense, considered to be inherently organized around issues from the past, rigid in operation, unconscious, and distorting of reality; and ego failure or 'fragmentation.'

Many notions from this approach appear in current theorizing. They include the idea that coping occurs in response not only to environmental demands, but also to intrapsychic pressures; that some ways of coping are inherently superior; and that people consistently show characteristic styles of coping with threat that reflect personality or ego development. Moreover, this work introduced several themes that are resurfacing in current discussions of coping, including the idea that some modes of adaptation are unconscious and unintentional, that distortions of reality can be adaptive, and that the self (or ego) and its regulatory functions are central to processes of coping.

Stress and Coping

A second strand of work emerged from research on stress, a concept prominent in the social and health sciences since the 1930s (Selye, 1950). Systematic attempts to link stress exposure to specific psychological or somatic outcomes revealed marked individual differences in the effects of stress. Explicit recognition that living organisms 'fight back,' as captured in terms like 'host resistance,' galvanized interest in the social and individual factors that determine vulnerability or resistance to the effects of stress. An important branch of this work contributed to the study of coping (Coelho et al., 1974; Lazarus and Folkman, 1984; Moos and Billings, 1982; Pearlin and Schooler, 1978). The transactional perspective, as articulated by Lazarus and his colleagues, held that the experience of stress is shaped by interpretations or appraisals of the meaning of environmental demands. Because these conceptualizations arose partly as a reaction to definitions of coping as an outcome of personality processes ordered along a hierarchy of ego maturity, transactional perspectives emphasize the importance of the actual demands a person is facing, and the impossibility of judging a priori which coping strategies are adaptive, without knowing the context and the social and personal resources available. They focus especially on the individual's *appraisal* of the significance and meaning of the stressful encounter. Coping itself is seen as a transactional process, iterating with (re) appraisals and environmental changes, and as having two primary functions: to deal directly with the environmental stressor (referred to as problem-focused coping) and to deal with the emotional consequences of the stressful transaction (emotion-focused coping).

The basic tenets of a transactional perspective, reflected in much of the current writing on coping, include the notion that coping does not directly reflect personality but varies in accordance with the situations in which it occurs; that no ways

of coping are inherently better; that any stressful event (such as illness or job loss) gives rise to a complex host of specific and changing demands; and that, in order to cope with these, any individual can and does use a wide variety of strategies. Perhaps most critical is the emphasis on coping as a process that unfolds over time.

Several methodological shifts in research accompanied this new approach. The measurement of coping shifted from clinical assessment to self-report and efforts were made to unconfound measures of coping from assessment of outcomes. In addition to a focus on coping with traumatic events (e.g., life-threatening illness or victimization), research also came to include the study of chronic stressful conditions and relatively minor everyday stressors or 'daily hassles.' Moreover, research became more specialized by type of stressor (e.g., health problems, work stress, or bereavement). Even within domains, research has become more finely differentiated. For example, different medical conditions are often studied separately.

Coping during Childhood, Adolescence, and Aging

Child psychologists have had a long-standing interest in the impact of adversity on children and, since the early part of the twentieth century, have attempted to document the effects, for example, of maternal deprivation, serious illness, hospitalization, and wartime conditions, as well as more recent attention to the effects of parental mental or physical illness, unemployment, poverty, and divorce. The first formal study of children's coping is often traced to Lois Murphy and her colleagues at the Menninger Clinic, who used intensive observations and interviews to conduct an 18-year longitudinal study of the ways in which normal children cope (Murphy and Moriarity, 1976).

The 1980s witnessed an explosion of quantitative work on children and adolescents, sparked by the publication of two seminal works on stress, coping, and development (Compas, 1987; Garmezy and Rutter, 1983). Although the current wave of research on children and youth closely resembles work on adults (Compas et al., 2001), it nevertheless highlights several important themes. It makes evident that coping is inherently shaped by social partners, close relationships, families, and communities (Hetherington and Blechman, 1996; McCubbin et al., 1996), and that many cognitive coping strategies, so prominent in adults, are not commonly used by children until late childhood (Zimmer-Gembeck and Skinner, 2011). Research on children also encourages a renewed consideration of the neurophysiological (Compas, 2006; Gunnar and Quevedo, 2007; Taylor and Stanton, 2007) and temperamental (Derryberry et al., 2003) underpinnings of coping, as well as attention to coping with normative developmental demands and tasks (Wolchik and Sandler, 1997).

Finally, a shift in focus to development across the life span spurred interest in how adults successively deal with life transitions, social changes, and the challenges of aging (Aldwin, 2007; Baltes and Baltes, 1990; Brandtstädter and Rothermund, 2002; Brandtstädter et al., 1999). Research on successful aging, in documenting that most people maintain a high level of psychological functioning despite objective biological declines and social losses, focuses attention on positive coping strategies, like selection, compensation, planning, and proactive coping. It also highlights the importance of 'accommodative' modes of coping, which allow people to acknowledge limitations, accept constraints, relinquish goals, withdraw from goal pursuit, and focus on gratitude and joy in current conditions.

Interventions to Improve Coping

A relatively distinct strand of work involves psychological and behavioral medicine interventions, which have succeeded in helping people deal adaptively with traumatic events and their associated ongoing stressors. In contrast to traditional therapy, these interventions focus on provision of information and social support, and on helping people build coping resources and skills for dealing more effectively with particular stressors, such as illness, chronic pain, divorce, or bereavement (Coyne and Racioppo, 2000; Sandler et al., 1997; Taylor and Stanton, 2007).

Transactional Perspectives on Coping

Transactional perspectives, which view coping as an interactive process that unfolds in several recursive steps, have guided much of the research on coping over the last 30 years (Folkman and Moskowitz, 2004; Lazarus and Folkman, 1984). According to this perspective, as pictured in **Figure 1**, coping transactions are initiated by encounters with *stress*, defined as internal and external events that individuals appraise as important to their well-being and as taxing or exceeding their resources (Lazarus and Folkman, 1984). Cognitive appraisals, focusing on the extent to which the stressor is personally relevant and amenable to personal control, result in views of the encounter as constituting a *threat* (i.e., impending harm), a *loss* (i.e., irreversible harm that has already been incurred), or a *challenge* (i.e., a stressor the individual is confident about mastering).

These appraisals trigger bouts of coping, defined as "cognitive and behavioral efforts to master, tolerate, or reduce external and internal demands and conflicts among them" (Folkman and Lazarus, 1980: 223), which utilize personal and social resources to solve the stressful problem or manage the individual's negative emotional reactions to it. These efforts produce coping outcomes, which, by feeding back to both the stressful event and individuals' reappraisal processes, can terminate or prolong the stressful transaction. According to this perspective, coping can be seen as a process that involves a wide variety of ways of reacting to and dealing with stressors that are organized sequentially, forming an interconnected action sequence or coping episode (Folkman and Lazarus, 1985).

Transactional Coping Research

Since the advent of the transactional approach, mainstream research has focused on *individual differences* in each of the links in the coping process. Typical studies examine a single population at a single time, and assess self-reported ways of coping (e.g., problem-solving, help-seeking, avoidance) with either a variety of unidentified stressors or a prespecified narrow class of stressors. Studies examine how these different ways of

Figure 1 A transactional model of coping as an episodic process and a transactional process.

coping are connected to a variety of outcomes, usually indicators of mental or somatic functioning (such as emotional adjustment or physical symptoms) in an attempt to identify adaptive and maladaptive coping strategies. Complementary studies examine the associations of different ways of coping with self-reports of proposed personal and social antecedents, focusing both on individual characteristics (such as self-efficacy, optimism, or perceptions of the availability of social support) and on characteristics of the social context (such as provision of instrumental aid or emotional comfort).

Much has been learned from these decades of research on individual differences and correlates of coping. Certain ways of coping seem to be 'adaptive' in that they are linked with indicators of mental health and functioning, particularly (1) problem-focused coping and the set of control-related factors that support it; (2) constructive thinking and the factors that support it (e.g., optimism); and (3) perceptions of support from trusted others. In contrast, certain ways of dealing with stress, such as escape, avoidance, rumination, or venting, seem to be maladaptive in that they are associated with mental distress and disorder. The status of other ways of coping, such as help-seeking, support-seeking, secondary control, and emotion-focused coping, is less clear because they are inconsistent in their connections to antecedents and outcomes. A number of individual and social resources for coping have also been identified, chief among them intelligence, optimism, mastery, self-esteem, sociability, perceived control, and social support (Taylor and Stanton, 2007).

As a body, however, this work has come under attack on both conceptual and methodological grounds. Studies have been criticized for being light on theory, for inconsistent use of coping categories, for relying heavily on self-report questionnaires, for using designs that cannot examine change, and for including only a narrow range of short-term outcomes. As noted by Sommerfield and McCrae, "The seemingly boundless enthusiasm for coping research seen in the 1980s has been replaced by widespread disaffection, intense scrutiny, and corresponding calls for change" (2000: 620). Cutting-edge research has already moved away from this empirical format and reflects the use of several innovative approaches.

Coping as a Process

Despite consensus that coping unfolds over time, research methodologies able to capture processes have just begun to (re) appear during the last decade. These include case studies, ethnographic narratives, interviews, and observations, which were popular decades ago (Block and Block, 1980; Folkman, 1997; Murphy and Moriarity, 1976; Valliant, 1986), as well as more recent quantitative methods, such as intraindividual time series analysis (Tennen et al., 2000). Designs are longitudinal, repeating measures over short times (e.g., daily) or over several years, often including markers of the progress of stressful events (e.g., diagnosis and surgery, or caretaking, deterioration, and death of a partner).

For microgenetic approaches, patterns of intraindividual relations among variables (e.g., problem- and emotion-focused coping) across time are determined. Then interindividual difference variables (e.g., depression or optimism) are used to form groups that are compared on their patterns of intraindividual relationships (Tennen et al., 2000). Observations of coping interactions with social partners (e.g., mothers and their children) can also be used to examine the sequential effects of individual coping and partner reactions over time (Skinner and Edge, 2002). Narratives and interviews capture a wider range of experiences and can track their progress over longer intervals (Folkman, 1997). The yield from this labor-intensive research seems promising. For example, such studies already suggest that both generation of and focus on positive experiences are critical in dealing constructively with chronic stress; that depression influences day-to-day reactions to chronic pain; and that maternal interpretations of negative events shape children's subsequent appraisals and coping. Many consider the study of coping as a process to be the most important goal of the next generation of coping researchers (Lazarus, 1993).

Two productive empirical strategies for capturing coping processes have been (1) to make particular categories of coping, such as accommodation or rumination, the focus of detailed programs of laboratory and naturalistic research (e.g., Nolen-Hoeksema et al., 2008) and (2) to study in fine-grained detail how children and adults deal with certain classes of environmental demands, such as noncontingency, failure, unpredictability, separation, loss, interpersonal conflict, competition, and coercion (e.g., Maier and Watkins, 2005). Relevant studies come from areas as diverse as learned helplessness, self-efficacy, perceived control, reactance, self-determination, compliance, attachment, interpersonal problem-solving, attributional biases, Type-A personality, and self-regulated learning.

These programs of research have produced relatively well-accepted conclusions about positive ways of coping, such as mastery-oriented thinking, disclosure and discussion, constructive thinking, proximity-seeking, accommodation, and optimism, and about the generally maladaptive consequences of rumination, helplessness, blaming others, catastrophizing, and social isolation. Programs of research on other ways of coping, such as help- or support-seeking, positive illusions, avoidance, denial, and relinquishing control, have produced less conclusive results, including evidence that their effects depend on characteristics of the situations in which they are employed. It should be noted that almost every activity that is considered a way of coping also has its own well-developed body of research. Most of these areas of research are largely independent of work on coping, although some examine the functioning of these processes under stress, and future research could combine them into a profile or repertoire of coping responses.

Developmental Perspectives on Coping

'Stress' is not inherently damaging to people, and the primary function of coping is not simply to shield people from stressful experiences. Coping is a process intrinsic to psychological and relational growth and one that individuals and groups are predisposed to do well. Interest in positive coping (Snyder, 1999) and the study of growth from adversity, transformation in the face of trauma, and benefit finding can be viewed as attempts to conceptualize and study the growth-facilitating functions of coping. Analysis of the role of coping in resilience in children (Haggerty et al., 1994) and the relationship of coping and development across the life span (Aldwin, 2007; Skinner and Zimmer-Gembeck, 2007) may help put these issues in a larger perspective. In research on children and adolescents, developmental conceptualizations are emerging that, building on transactional perspectives, tie coping back to its roots as an adaptive process, focus on the role of coping as inherently regulatory, consider ways of coping as forms of action regulation, and make a place for learning and development.

Coping as Regulation

An explicit theme resurfacing in discussions and research is the notion that coping is an inherently regulatory process (Aspinwall and Taylor, 1997; Barrett and Campos, 1991; Block and Block, 1980; Eisenberg et al., 1997; Rossman, 1992; Skinner and Zimmer-Gembeck, 2009). A focus on adaptation suggests that the cognitions, appraisals, motivation, volition, behaviors, and emotions, which are clearly parts of coping, must be assembled into actions, which are sequentially coordinated with internal and external conditions. Labels under which such processes are studied include ego functioning (e.g., ego-control and ego-resilience), conscience, functionalist theories of emotion, theories of self-regulation (and regulation of behavior, emotion, and attention), and theories of volition and action regulation.

As with regulation, conceptualizations of coping have converged on dual-process models. Within regulation, the distinction is made between the target to be regulated (typically an emotion or impulse) and the processes used to modulate it. In work on coping, theorists differentiate (1) stress reactions, which refer to immediate involuntary physiological, psychological, and behavioral responses to stressful situations, from (2) action regulation, which describes how people mobilize, guide, manage, energize, and direct behavior, emotion, and orientation (or how they fail to do so) under stress. There is active debate about how these two processes are coordinated, but researchers agree that they mutually influence each other (Compas et al., 1999). Manifest coping responses likely reflect the balance (or more precisely, the imbalance) between reactivity and regulation: Involuntary stress reactions are likely the product of extreme stress reactivity combined with weak or disabled regulatory systems, whereas volitional coping responses are the result of weak stress reactions and/or well-developed action regulation systems (Metcalfe and Mischel, 1999).

Regulation and coping differ in at least two important ways (Compas et al., 2014). First, coping focuses only on "regulatory processes in a subset of contexts – those involving stress" (Eisenberg et al., 1997: 42). Second, research on regulation, as reflected in its labels, typically examines efforts to manage a single facet of action (e.g., emotion, attention, or behavior), whereas coping, in contrast, is an organizational construct, encompassing the simultaneous regulation of all these processes. When facing stressful events, individuals attempt not only to handle emotions, but also to manage thoughts, behaviors, attention, and even physiological reactions. Coping is essentially concerned with the integration and coordination among facets of action, for example, how a focus on one may have an (often unintended) impact on others, as when rumination undermines problem-solving or when seeking help bolsters persistence. Conceptions of coping as a dynamic regulatory process may contribute to the next phase of coping work (Carver and Scheier, 1998; Neufeld, 1999). Features of the self involved in recognizing and creating 'relational meaning' (Lazarus, 1993) may be studied as integral organizers of regulation.

Ways of Coping as Strategies of Action Regulation

Of central concern to coping researchers are the ways people deal with actual problems. The study of actual coping categories, such as problem-solving, support-seeking, rumination, or escape, distinguishes research on coping from closely related work on stress, adaptation, risk, resilience, and competence. The examination of a variety of responses distinguishes the

study of coping from the disparate programs of research focusing on each of the individual ways of coping. Hence, constructing category systems to conceptualize and measure coping has been a central endeavor of the field. However, this task is made difficult by the complexity of coping. Coping responses, because they are tailored to particular demands and resources, and attuned to the specific contexts in which they are enacted, are practically limitless in their variety; a recent review collected over 400 different category labels (Skinner et al., 2003). Research has been slowed by widespread disagreement about taxonomies of coping. No consensus exists about core categories. Years of exploratory factor analyses have failed to converge on a set of higher-order categories, nor do theorists agree on systems for rational classification. Given the seemingly infinite variety of specific coping responses, even the possibility of identifying a core subset of ways of coping has been questioned.

One promising approach uses theory and confirmatory factor analysis to identify multiple core categories. Over the last two decades, researchers have put enormous effort into conceptualizing and assessing hierarchical models that use higher-order categories or families to organize multiple lower-order ways of coping. Researchers have attempted to conceptually identify a finite set of basic adaptive processes and then to classify many different ways of coping as belonging to a 'family' of ways of coping that serve each function. Examples of theories used in these attempts include functionalist theories of emotion, theories of motivation, regulation, primary and secondary control, and ego processes.

Despite differences in theoretical approaches and dimensions, conceptual and empirical analyses have converged on a small number of families of coping, perhaps a dozen or so, that can be used to classify, most if not all, the ways of coping identified in previous research (Skinner et al., 2003). These include problem-solving, support-seeking, escape, distraction, cognitive restructuring, rumination, helplessness, social withdrawal, emotional regulation, information-seeking, negotiation, opposition, and delegation. Families, however, include not only the lower-order ways of coping depicted in their labels, but also all the other ways of coping that serve that same set of functions For example, 'escape' includes not only physically leaving a stressful situation, but also mental escape, withdrawal of effort, denial, avoidance, and other actions that remove the person from contact with distressing interactions. These 12 families of coping include the most common ways of coping utilized by people and studied by researchers (Skinner et al., 2003; Zimmer-Gembeck and Skinner, 2011). The identification of these higher-order families helps clarify the complex structure of coping and encourages renewed discussions of its adaptive functions (Coelho et al., 1974; Lazarus and Folkman, 1984). Such discussions expand on the distinction between problem-focused versus emotion-focused coping and on coping styles (e.g., repression vs sensitization) as well as reopening discussions of the functions of coping in adaptation.

The Development of Coping

When coping is returned to its core meaning as a fundamental adaptive process, the transactional steps of coping can be divided into basic tasks: (1) to detect and interpret information about internal and external demands (threat detection and appraisal); (2) to prepare a response based on internal and external guides and capacities (action readiness); and (3) to execute a response by coordinating action tendencies with internal and external demands and resources (action regulation). Moreover, in order to develop, the coping system also needs (4) to recover and learn from stressful encounters. These tasks are depicted in Figure 2.

Hence, at the most global level, one way of outlining the age-graded progression of coping, as well as its qualitative

Figure 2 Coping as a process that allows individuals to detect, deal with, and learn from stressful encounters.

shifts, is to consider several broad developmental phases that are characterized by different mechanisms of detection, appraisal, reactivity, regulation, and learning, as well as different kinds of participation by social partners. As we described in our earlier work:

> Infancy would begin with stress reactions governed by reflexes, soon to be supplemented by coordinated *action schema*; during this period, caregivers would carry out coping actions based on the expressed intentions of their infants (interpersonal co-regulation). During toddlerhood and preschool age, coping would increasingly be carried out using *direct actions*, including those to enlist the participation of social partners; this would be the age at which voluntary coping actions would first appear (intrapersonal self-regulation). During middle childhood, coping through *cognitive means* would solidify, as described in work on distraction, delay, and problem-solving; children would be increasingly able to coordinate their coping efforts with those of others. By adolescence, coping through *meta-cognitive means* would be added, in which adolescents are capable of regulating their coping actions based on future concerns, including long-term goals and effects on others.
>
> Skinner and Zimmer-Gembeck, 2007: 128

Age-graded shifts in the basic tasks of coping (i.e., detection and appraisal, action tendencies and regulation, and learning) are shaped, on the one hand, by the development of neurophysiological subsystems and, on the other hand, by changes in the demands and resources provided by social partners, and especially caregivers. Research on the development of regulatory subsystems (including attentional, emotional, and behavioral regulation) can be used to trace the course of age-related changes in how these subsystems are triggered and coordinated in the face of stress. Social partners, especially caregivers, play a crucial role in the development of all these subsystems, both in the emergence and consolidation of these regulatory resources and capacities. Moreover, the caregiver's role in coping *changes* over development, from one in which they are doing most of the coping for newborns based on their infants' expressed preferences, to one of direct participation, then cooperation, and finally acting as a resource and backup system to the relatively independent coping of which adolescents are capable by the time they reach emerging adulthood.

Taken together, these developments should suggest normative patterns of change and normative transitions that characterize the healthy development of adaptive systems for constructive coping. They should also suggest differential pathways of development, based on factors (such as temperament, quality of attachment and parenting, and exposure to stressful events) that contribute to ways of negotiating these normative transitions that put individuals at risk for the development of maladaptive patterns of coping and psychopathology.

Conclusion

As the construct of coping reaches the end of its fifth decade as an official term in the psychological lexicon, it continues to inspire researchers and interventionists with its potential to capture important features of 'host resistance,' that still elusive quality that allows individuals to actively wrestle with intrapsychic and environmental challenges and problems, sometimes besting them, sometimes accepting them, or just plain losing, but still with the possibility to extract from these difficult and painful interactions lessons about how to avoid or approach the next stressful encounter. The promise of the area of coping, and its challenge to researchers, is to examine coping as an engine of development or a catalyst for change, to determine if conceptions of coping can provide a process mechanism that explains how people (individually and collectively), in the face of adversity, are able to find and create opportunities for development.

Abstract

Personality traits are associated with stable affective dispositions, including vulnerability to stress. Coping is conceptualized as a process that mediates interactions between people and sources of environmental demand. Thus, research on coping may help to explain associations between personality and affective response. Various traits correlate with coping preferences. Traits associated with stress vulnerability, such as neuroticism, may predispose maladaptive coping with challenging events, although coping is also strongly influenced by situational factors. Adaptive personality characteristics including resilience and emotional intelligence may be associated with use of effective coping strategies. Research in this field may be applied to enhancing individual resilience to stress.

Personality and coping are two key constructs in psychology that lack obvious compatibility (Parker and Wood, 2008). The dominant paradigm in contemporary personality research emphasizes the relative stability of personality traits, such as the Five Factor Model (FFM or 'Big Five'). That is, individuals display consistent patterns of behavior across a range of different situations. By contrast, theories of coping with stress (Lazarus, 1999) tend to emphasize the variability of coping as an expression of the person's idiosyncratic evaluations of specific situations. Such theory lends itself to intraindividual investigations, focusing on situational determinants of coping, rather than research on interindividual differences displayed across multiple situations (Parker and Wood, 2008). Fortunately, a changing theoretical landscape increasingly permits integration of these different perspectives within an interactionist perspective that acknowledges the importance of both person and situation factors in shaping response to challenging events (Matthews et al., 2009). It is also acknowledged that coping may be viewed both as a stable preference for using certain strategies (a trait or style) and as a specific set of strategies and behaviors applied to an immediate situation (a state).

In this article, we consider first the differing theoretical perspectives traditionally associated with personality and coping (section 'Theoretical Frameworks'), followed by a brief survey of the measurement models used in research (section 'Measurement Models'). In reviewing research in the area (section 'Research On Personality Traits And Coping'), we differentiate correlational studies (section 'Descriptive Correlational Studies') from more theory-driven research that aims to use coping models to understanding personality processes (section 'Coping as a Personality Process'). In the section 'Individual Differences in Coping Effectiveness', we turn to the issue of coping effectiveness and adaptation to stress, with subsections on the definition of effectiveness (section 'Defining Coping Effectiveness') and the relation between personality and resilience to stress (section 'Personality and Resilience'). We then discuss the popular construct of emotional intelligence (EI) (section 'Emotional Intelligence and Coping'). We consider how EI may be conceptualized in relation to effective coping and emotion regulation (section 'Conceptualizing Coping as EI in Action') and relevant empirical studies (section 'Empirical Studies of EI and Coping'). In the section 'Applications of Research' we cover applications of personality and coping research to clinical, educational, and industrial-organizational psychology, prior to the conclusion (section 'Conclusion').

Theoretical Frameworks

The predominant personality theory applied to studies of coping is the FFM (McCrae, 2009), which discriminates Extraversion, Neuroticism, Conscientiousness, Agreeableness, and Openness (E, N, C, A, and O, respectively) as the preeminent stable personality traits. Numerous other traits have also been investigated as potential correlates of coping, but typically such traits can be aligned with one or more FFM factors. Definitions of the FFM and other traits imply that they may be linked to stable interindividual differences in coping style. For example, we might expect that (1) extraverts would be more likely to seek social support than introverts and (2) persons high in N would engage in ineffective or counterproductive efforts at coping.

Traditionally, variation in traits is attributed to individual differences in brain systems for arousal, including structural and functional facets or reinforcement sensitivity. Psychobiological personality theories do not include coping as an explanatory construct capable of mediating the emotional and behavioral expressions of traits. More recently, the role of cognitive processes in personality has been increasingly accepted. Emotional expressions of traits may in part reflect individual differences in cognitive appraisal and the choice and regulation of coping strategies (Matthews et al., 2009). Thus, the negative emotionality associated with high N may reflect not only a highly sensitive brain punishment system, but also systematic cognitive biases, such as appraisal of events as threatening, and a preference for coping with events through worrying about them or self-blaming. It is then hypothesized that measures of traits will predict how the individual copes when exposed to a threatening or challenging situation.

Development of the cognitive theory of personality requires the core concepts of contemporary psychological stress theory.

According to Lazarus (1999), these are *appraisal*, the evaluation of the personal significance of events, and *coping*, the selection of a strategy to effectively manage or control the event, for example, through mitigating or circumventing harm or finding a way to benefit from it. Coping here is conceptualized as an extended process that typically changes over time, in response to both changing external events and the person's own reappraisals of the success or otherwise of their attempts to cope. Ineffective or maladaptive coping will promote psychological and physiological symptoms of stress, especially if the threat is severe, prolonged, or involves multiple stressors. The additional insight from personality theory is that although situational factors, such as the controllability of the event, exert a powerful influence on coping, there are also systematic biases in choice of strategy that are related to personality traits. For example, a person high on N may prefer to cope via self-blame, whereas a person high on E may prefer seeking social support.

Testing the cognitive theory of personality in relation to coping requires accommodation of situational factors, consistent with an interactionist perspective (Matthews et al., 2009). That is, a stressful encounter may interact with a person's personality to impact choice of coping strategy, which in turn may determine outcomes of the stress process. One approach is to conduct experimental studies in which individual differences in coping with a laboratory stressor may be observed. Such studies have the advantage of experimental control and precise measurement of the time course of response, but are lacking in other respects. Stressors must perforce be relatively mild, and perhaps unrepresentative of real-life events. This issue raises the perennial question of the ecological validity of lab experiments. Furthermore, it is difficult to observe the continual flow of person–situation interaction stated by Lazarus (1999) to be central to the stress process. The role of personality in life stress may be studied through longitudinal studies in which key variables are tracked over time, allowing causal modeling of the data. Such models may also reveal influences of stress factors on personality, as well as the influence of personality on stress (Ormel et al., 2012). Various statistical techniques for conducting such longitudinal analyses (latent change modeling, latent growth curve analyses, etc.) are now available and can be readily employed to test hypotheses related to the interplay between coping and personality over time.

Measurement Models

Personality research has benefited from the rigorous psychometric models developed over decades of quantitative studies of the FFM and other structural schemes (McCrae, 2009). By contrast, early research on coping focused on how individual persons cope qualitatively (the 'idiographic' approach), leading to a neglect of quantitative assessment. Nevertheless, it became clear that there are different modes of coping, which may be distinguished operationally. A review of coping measures is beyond the present scope (see Schwarzer and Schwarzer, 1996), but some of the main distinctions between facets of coping will be presented. Lazarus and his colleagues made a theoretical distinction between problem-focused coping that is directed toward systematic efforts to improve the external situation, and emotion-focused coping referring to efforts at changing one's feelings and thoughts about the event. Endler and Parker's (1990) Coping Inventory for Stressful Situations (CISS) included scales for these two constructs, as well as items that defined a third dimension of avoidance. Furthermore, Endler and Parker (1990) found that E was associated with a preference for problem-focus, and N with greater use of emotion-focus and avoidance, at least according to the respondent's self-report.

Subsequently, research has employed a wide variety of instruments. Recently, Carver and O'Connor-Smith (2010) highlighted the following constructs incorporated into coping scales, in addition to problem- versus emotion-focus.

Engagement versus Disengagement

Engagement refers to coping through approaching or directly confronting the stressor, not only through problem-focused action, but also by forms of emotion-focus including seeking support and constructive thinking. Disengagement refers to avoidance, denial, and wishful thinking. E and N are often linked to approach and avoidance tendencies, respectively.

Accommodative and Meaning-Focused Coping

Rather than attempt to control a stressor directly, a person may try to accept changes in life circumstances, to restructure their personal goals, and to find meaning in otherwise adverse events. Such 'positive-thinking' strategies are often seen as an attribute of EI, as further discussed below in the section EI and Coping.

Proactive Coping

People may try to anticipate and forestall adverse events, typically through problem-focused efforts to prepare contingency plans, and build up resources to defend against threat. We might expect conscientious individuals to favor such strategies.

Research on Personality Traits and Coping

Descriptive Correlational Studies

Numerous investigations have reported cross-sectional associations between a wide range of personality traits and coping scales. **Table 1** shows some of the major associations between the FFM and coping dimensions determined in a meta-analysis of 165 samples (O'Connor and Flachsbart, 2007). In terms of the descriptive scheme set out by Carver and O'Connor-Smith (2010), both E and C were linked to use of engagement strategies, whereas N was associated with several disengagement strategies as well as venting negative emotion. Numerous small-magnitude associations have been omitted from the table; both A and O were weakly associated with several engagement strategies. The meta-analysis also confirmed the psychometric distinctiveness of personality and coping measures. None of the associations listed exceeded 0.5, and there were several coping strategies including acceptance and emotion regulation that were minimally related to the FFM.

Table 1 Major relationships between Five Factor Model (FFM) traits and coping in a meta-analysis

FFM trait	*Preferred coping strategies*
Extraversion	Problem-solving
	Use of social support
	Cognitive restructuring
Neuroticism	Expression of negative emotion
	Withdrawal
	Wishful thinking
	Substance use
Conscientiousness	Problem-solving
	Cognitive restructuring
Agreeableness	–
Openness	–

Note: The table lists associations for which the mean estimated personality–coping correlation was 0.20 or higher.
Connor-Smith, J.K., Flachsbart, C., 2007. Relations between personality and coping: a meta-analysis. Journal of Personality and Social Psychology 93, 1080–1107.

Cross-sectional studies are valuable for elaborating the network of relationships between the various constructs, providing evidence on the validity of personality and coping measures alike and suggesting hypotheses for further research. However, they are limited in their neglect of the dynamic relationships emphasized by Lazarus (1999) and frequent failure to accommodate the role of contextual moderators. For example, O might be more strongly related to coping in intellectual or creative contexts, and the impact of Aon coping might be different in cooperative and competitive social situations. There is also a concern that the association between personality and coping may be inflated by method factors. Both types of scale depend on retrospective self-reports of general personal tendencies, which in the case of coping may not be a veridical representation of how the person actually behaves when exposed to some specific stressor. Trait measures do indeed tend to correlate with dispositional styles of coping more strongly than with immediate situational coping (Carver and O'Connor-Smith, 2010).

Coping as a Personality Process

Coping may be important for understanding how personality traits influence behavior and subjective experience. Are high N individuals typically unhappy *because* they cope ineffectively with the demands of life? That is, are some of the various expressions of personality mediated by individual differences in coping? Mediation hypotheses may be tested in both experimental and longitudinal survey designs. Experimental studies of performance stressors such as cognitive overload and time pressure are suitable for investigating the role of individual differences in situational coping in acute stress response. The stress response is multivariate. Depending on task characteristics, the person may show more or less task engagement, distress, or worry. For example, cognitive overload tends to produce distress responses, characterized by anxiety, tension, unhappiness, and loss of self-confidence, whereas monotonous, fatiguing tasks induce loss of task engagement (Matthews et al., 2013).

Performance studies that draw on the Lazarus (1999) model of stress and coping variously show that individual differences in stress response are systematically linked to both situational coping and appraisal of task demands. In terms of the Endler and Parker (1990) model, task- (or problem-) focus tends to elicit high task engagement, self-critical emotion-focus produces distress and worry, and avoidance also adds to worry. Appraisal may also influence stress response; e.g., challenge elevates task engagement (Matthews et al., 2013). Appraisal may also affect response indirectly; e.g., lack of perceived control elicits emotion-focused and avoidant coping (Matthews et al., 2013). Coping also has behavioral consequences. Task-focus also appears to be effective in promoting superior objective performance, whereas emotion-focus and avoidance are negatively related to performance (Matthews et al., in press).

Personality traits are modestly associated with both cognitive stress processes and stress outcomes, in experimental studies of performance and other stressors. Effect sizes (*r*s) rarely exceed 0.3–0.4. The most reliable associations are found for N and trait anxiety, which are associated with heightened appraisals of threat and uncontrollability and greater situational use of emotion-focus and avoidance, consistent with studies of dispositional coping style (O'Connor and Flachsbart, 2007). For example, Matthews et al. (2006) investigated three task stressors: overload induced by high time pressure, failure on an impossible anagrams task, and monotony resulting from a demanding vigilance task. N was associated with elevated distress response, and the personality effect was mediated by emotion-focused coping. In addition, C was associated with both situational task-focus and higher task engagement.

Experimental studies are essential for testing potential-mediating mechanisms in personality research, but they also have limitations. Assessments of acute stress response and performance provide only limited insights into coping effectiveness, as previously discussed. For example, while problem-focused coping is normally adaptive in work environments, in a dead-end job there may be advantages to emotion-focused coping directed toward deciding whether it is worthwhile to consider a different line of employment. Simple mediation models also miss some of the subtlety of the interplay between personality, coping, and stress response. Personality may also have a moderator effect in determining how well a strategy works for the individual (Bolger and Zuckerman, 1995). For example, task-focused coping may only be effective if the person has the skills to implement such a strategy successfully, such as computer skills when seeking an alternative job in the hi-tech industry. Similarly, seeking social support may be more effective if the person is high in A or E and is embedded in a supportive social network. Traits may also influence exposure to stressors, necessitating higher frequency of coping (Matthews et al., 2009). Someone high in N but low in A may commonly have to deal with interpersonal conflicts.

Individual Differences in Coping Effectiveness

Defining Coping Effectiveness

Research on personality and coping begins with a descriptive account of how major personality traits are associated with

measures of the various coping styles, such as those differentiated by Carver and O'Connor-Smith (2010). Identification of the coping styles typical of the different traits leads to various additional research questions. A common research preoccupation is the extent to which individual differences in coping translate into variation in outcomes and adaptive success or failure. In particular, people high in N and in related characteristics such as trait anxiety tend to experience lower well-being and greater vulnerability to stress and even emotional disorder. Individual differences in coping may contribute to such outcomes. Building an argument of this kind requires that we can differentiate coping strategies according to their effectiveness. However, it is important to note at this juncture that coping strategies are not uniformly adaptive and it is often difficult to predict the effectiveness of a given coping strategy a priori (Zeidner and Saklofske, 1996). As stressed by Zeidner and Saklofske (1996), the consequences of a given coping style or behavior are determined to a major extent by the interaction of personal traits, needs, and preferences, in dynamic interaction with the constraints of the parameters of the particular stressful encounter. Thus, specific coping strategies tend to be more or less effective depending on the type of stress encountered by a specific person.

Coping processes are of pivotal importance in that they may affect adaptive outcomes, for better or worse. Effective coping will help an individual adapt to a stressful situation by reducing distress and anxiety, but misplaced, counterproductive coping attempts may make the situation worse and eventually lead to elevated anxiety. People typically develop a repertoire of coping strategies for dealing with the difficulties that arise in relationships, at work, and in financial matters. Most people attain reasonable competence in coping with stress and anxiety through learning (direct instruction, modeling behavior of relevant others, reinforcements) and experience (positive or negative consequences of coping behaviors). Coping strategies may protect us by eliminating or modifying the conditions that produce anxiety or by keeping the emotional consequences within manageable bounds. Coping may also affect outcomes through its impact on the frequency, intensity, duration, and patterning of physiological stress reactions and the resultant affective and somatic outcomes. Often, coping strategies may impede – rather than promote – health-related behaviors. For example, a person's health may be negatively affected when coping involves risk taking (e.g., high-speed car racing or substance abuse).

The psychology of stress gives us a rich descriptive account of different types of coping. The practical question though is 'what works?' Unfortunately, the simple question of what works has no simple answer: a coping response might be judged successful relative to one outcome criterion but not another (Zeidner and Saklofske, 1996). Indeed, the resolution of one coping task might even come at the expense of another (e.g., working long hours to complete a PhD thesis might contribute to problems at work or a marriage breakdown). Coping effectiveness must be examined in the social context in which problems occur. Preferred coping methods and perceived effectiveness must be appraised relative to a social or cultural group's values, norms, worldview, symbols, and orientation. Consider the case of a female student who devotes herself to her children or ailing parents at the expense of personal achievement goals at her academic studies. The evaluation of this coping approach is not merely a scientific but a moral matter and may differ in traditional versus achievement-oriented societies. Thus, any statement about coping effectiveness is at best a broad generalization. With this caution in mind, there are a number of specific techniques that have been typically judged by researchers as adaptive, others that have been judged as maladaptive, whereas other techniques present dilemmas to researchers.

Theorists have frequently emphasized the positive effects of problem-focused coping on psychological outcomes (Lazarus and Folkman, 1984). In fact, active coping is preferred by most persons and is generally more effective in stress reduction in Western industrialized and individualistic societies. Other strategies are increasingly used when the source of stress is unclear, when there is a lack of knowledge about stress modification, or when there is little one can do to eliminate stress. By contrast, theorists have frequently emphasized the negative effects of avoidance and emotion-focused coping on psychological outcomes, especially when the threatening situation can be ameliorated by the subject's responses (Lazarus and Folkman, 1984). Behavioral or mental disengagement, ventilation of emotions, and short-term tension reduction strategies (e.g., use of drug, alcohol, smoking, gambling) are generally candidates for dysfunctional coping tactics for the amelioration of anxiety. By contrast, there may be psychological benefits to more constructive forms of emotion-focus, such as gaining understanding of one's emotional reactions to an uncontrollable event, such as bereavement. Similarly, avoidance coping has both its adaptive and maladaptive aspects. On the one hand, avoidance coping that leads to delay in taking necessary action (e.g., going to see the dentist for that regular checkup) is positively tied to concurrent distress. On the other hand, avoidance may be a useful tactic at times if it gives the person a psychological breather and an opportunity to escape from the constant pressures of the stressful situation. Also, the effectiveness of a particular coping strategy may change across the phases of a stressful encounter. While problem-focused coping may be effective in preparing for a final exam, emotion-focused coping may be effective during the anticipatory phase of awaiting the test results.

Personality and Resilience

In tune with current interest in 'positive psychology,' personality researchers are increasingly interested in the qualities that support personal growth and success in challenging or adverse environments. If we can delineate generally effective coping strategies, perhaps we can also identify effective copers. Resilience is seen as an important, general aspect of personality that moderates the impact of stressors (Skodol, 2010). In a sense, resilience is close to being tautological with coping effectiveness. Personality scales for qualities such as hardiness, toughness, grit, and sense of coherence may capture some general coping ability distinct from any specific coping style or preference. For example, the US military aims to train resilience to enhance combat effectiveness and to reduce vulnerability to traumatic stress. Skodol (2010) cites several longitudinal studies that suggest that traits for resilience are associated with greater long-term well-being following various negative or

challenging life events, including childhood abuse, abortion, and cancer surgery. For example, sense of coherence may impact upon the traumatic memories of holocaust survivors and is related to well-being in late life. However, the extent to which personality effects on outcomes are mediated by coping varies from study to study.

There are several barriers to conceptualizing personality in terms of dispositional resilience. First, it is unclear whether traits for resilience are psychometrically distinct from broader constructs such as emotional stability (low N, and the related concept of core self-evaluations; see Elliott et al., 2013). In fact, some have perceived hardiness as a combination of low N and high E. As such, hardiness may simply be a different label for the same underlying traits. Second, it is often difficult to establish reliable moderator effects in research (Matthews et al., 2009). The assumption is that resilience becomes evident only in demanding, potentially stressful environments, in line with the saying that "when the going gets tough, the tough get going." Thus, stress outcomes should reflect an interaction between trait resilience and environmental stress. In some studies, though, individuals high in resilience exhibit higher well-being regardless of external pressures, so that personality and external stressors have additive effects, contrary to the moderator hypothesis. Third, there remains uncertainty over the extent to which resilience should be conceptualized as a preexisting personality characteristic that emerges when the going gets tough, or whether resilience is better characterized as an ongoing process of adjustment.

In sum, resilience is a promising new construct in stress research that may be associated with personality. However, substantial questions remain about the conceptualization of resilience and the extent to which the construct offers anything novel to personality and coping researchers. Another construct that is related to general emotional adaptation is EI, which we will cover in more detail subsequently.

EI and Coping

This section discusses the role of EI in coping with psychological stress – an area of research in which EI has been claimed to play a pivotal role. Specifically, we critically examine the conceptual underpinnings and empirical evidence for the utility of EI in determining or predicting styles and strategies of coping.

Conceptualizing Coping as EI in Action

EI has been one of the most popular, but contentious, constructs in modern day psychology (Zeidner et al., 2009). Broadly defined, EI represents a set of hierarchically organized core competencies for identifying, processing, and regulating emotions – in both self and others (Salovey et al., 1999). There are currently two different and conflicting models for conceptualizing and researching EI: (1) EI as a cognitive ability, best measured via performance-type tests, and (2) EI as a noncognitive factor or trait, best measured via self-report inventories. In this section we focus mainly on the latter model, although both aspects of EI are linked to greater well-being and other positive social–emotional outcomes (Zeidner et al., 2009).

Recent theorizing and research suggest that EI may indeed be a pivotal factor determining how a person handles stress in daily life and confronts: what Shakespeare so aptly termed "the slings and arrows of outrageous fortune." Various researchers have proposed theoretical links between EI and coping. For example, Zeidner et al. (2006) suggested that "adaptive coping might be conceptualized as EI in action, supporting mastery of emotions, emotional growth, and both cognitive and emotional differentiation, allowing us to evolve in an ever changing world" (p. 460). Current thinking among proponents of EI suggests that "heeding the wisdom" provided by the emotional system determines effective coping behaviors and shapes adaptive outcomes. Salovey et al. (1999) claimed that EI helps individuals cope successfully because they "accurately perceive and appraise their emotional states, know how and when to express their feelings, and can effectively regulate their mood states" (p. 161).

Conceptually, EI should indeed effectively mobilize coping processes to promote adaptation, plausibly operating as a personal resource in determining choice and implementation of an appropriate coping style, which in turn affects adaptive outcomes. Emotionally intelligent individuals, who are skilled at expressing, understanding, and managing their emotions and who are capable of adaptively coping with the stressors and hassles of everyday life, should also experience more positive outcomes than their low-EI counterparts. In fact, EI may be part of one's affective arsenal and 'bag-of-tricks' to manage emotion-laden encounters and coping with stressful encounters.

Empirical Studies of EI and Coping

Given the proposed conceptual links between EI and coping, a body of research has examined the empirical associations between EI and adaptive coping styles. Research devoted to uncovering relations between EI and effective coping strategies has generally touched on two related issues. The first and simpler issue has involved determining how EI measures correlate with established coping measures, including, for example, dispositional or situational coping strategy (EI → coping disposition → situational coping).

Overall, studies that have examined the EI–coping relationship have found that questionnaires for EI related significantly to more use of problem-oriented, active, and rational coping, and less use of emotion-focused, passive, and irrational coping styles. Zeidner et al. (2006) summarized much of the research linking EI and coping, noting that correlations among these constructs range between 0.20 and 0.60. Furthermore, the strength and direction of the relationships varies according to the ways in which EI is operationalized (trait EI versus ability EI) as well as the type of coping strategy measured (problem-focused, emotion-focused, or avoidant). Trait EI shows a consistent positive relationship to problem-focused coping, with correlations mainly at the $r = 0.30$–0.40 levels. Trait EI also shows a consistent negative association with emotion-focused coping at around the $r = -0.30$ level. Relationships of trait EI with avoidance coping tend to be trivially small but consistently negative.

Furthermore, trait EI was shown to promote the choice of adaptive strategies not only in the case of stress, but also in

other emotions such as anger, sadness, fear, jealousy, and shame, as well as promoting the use of adaptive strategies to maintain joy. An alternative research strategy is to assess situational coping with a specific challenge, as in the performance studies reviewed previously. A body of research suggests that participants who were better at repairing their emotions and could clearly distinguish their emotions also reported less negative emotional responses and personal distress, which enables individuals to adapt to stressful encounters.

The second, more subtle, issue has involved ascertaining whether coping mediates (EI → coping → adaptive outcomes) or moderates associations between EI and adaptive outcomes (EI × coping → adaptive outcomes). **Table 2** lists several mediating mechanisms that might be responsible for superior social–emotional adaptation in those high in EI; some but limited evidence supports these proposals. In any case, as a broad-based characteristic, it is likely that EI supports multiple, complementary competencies in handling adverse events. A small number of studies also suggest the EI may have moderator effects, for example, by amplifying the beneficial effects of active or engagement coping (Zeidner et al., 2006). However, research on these issues is still rather scant.

Overall, the scope of individual differences in coping linked to EI is very broad indeed. Some of the mediating mechanisms (e.g., adaptive regulation) refer directly to coping with emotion. Other mechanisms, such as managing exposure to stressors, are more likely to influence emotion indirectly, depending on the outcome of the encounter. Most self-report measures of EI have proved to be substantially confounded with existing personality and stress symptom measures, with relatively few studies statistically controlling for personality factors. At present, there is a dearth of research demonstrating how EI impacts outcomes via multiple coping strategies and how the respective influences of EI and standard personality traits should be differentiated.

Table 2 Possible mediators for effects of emotional intelligence on adaptive coping and well-being

Mediator	*Mechanism: emotionally intelligent individuals...*
Circumventing stressful encounters	Identify, anticipate, and forestall socially threatening encounters
Constructive thought patterns	Identify and reconstruct faulty or unproductive appraisals and future expectancies
Richer personal coping resources	Access greater reserves of cognitive, emotional, social, physical, and spiritual resources in coping with unfamiliar challenges
Mood-regulation and repair	Understand sources of unwanted emotions and regulate them accordingly
Disclosure of past personal traumas	Restructure emotionally disturbing experiences to add meaning and coherence to life
Use of social support	Enlist others to support personal coping, assisted by high social skills
Flexibility of coping	Identify most appropriate strategy for a specific stressor, and switch strategy when required

Applications of Research

Understanding interrelationships between personality and coping may also contribute to tackling various applied issues. The role of dysfunctional coping is especially evident in *clinical psychology*. Use of strategies such as rumination and perseverative worry is commonly observed in patients diagnosed with mood and anxiety disorders. Coping strategies that work to increase awareness of symptoms and to block paths toward constructive management of the disorder may contribute to the onset and/or maintenance of emotional disorders, although there is debate over the causal role of coping in disorder. The Self-Referent Executive Function theory (S-REF: Wells and Matthews, 1994) sees dysfunctional coping as dynamically linked to intrusions of symptoms and harmful self-beliefs. For example, the socially anxious individual may cope by avoiding social encounters, which in turn reinforces beliefs in personal incompetence and reduces opportunities to acquire social skills. Training improved coping skills may contribute to psychotherapy.

Misdirected coping efforts are also a target for interventions in *educational* and *school psychology*. Students may cope poorly with academic demands, for example, through procrastinating. Success in school is also bound up with more general personal development. Children whose personalities incline them to cope with conflicts with peers and teachers through withdrawal and worry (internalizing behaviors) or through aggression and confrontation (externalizing behaviors) may be at risk of academic failure as well as stress symptoms. Recent interest in social–emotional learning (SEL) programs includes efforts at training effective coping strategies for dealing with various academic and interpersonal demands. Subsequently, we consider test anxiety in more detail as an example of an educational issue for which understanding the roles of personality and coping is requisite.

Finally, the roles of stress and emotion in the workplace are increasingly acknowledged in *industrial-organizational psychology*. Personality traits are at least modestly associated with a variety of affective outcomes. For example, employees high in N experience lower job satisfaction and may be more prone to absenteeism, ill-health, and high job turnover (Matthews et al., 2009). Failure to cope effectively may contribute to such stress outcomes, and studies suggest that maladaptive coping strategies such as self-criticism may mediate associations between N and stress outcomes (Matthews et al., 2009). Understanding the role of personality may help workplace stress management programs to address the specific vulnerabilities in coping of the individual.

Conclusion

Personality is often expressed through emotional functioning and stress response. Theories of coping provide an important path toward understanding individual differences in emotion regulation. Standard personality traits are commonly correlated with measures of coping, sometimes substantially so. It remains challenging to specify the role of personality in the dynamic person–situation interaction that characterizes the stress process. However, coping processes potentially mediate

and moderate the impacts of personality on emotional and behavioral response to stress. The nature of adaptive patterns of coping is also somewhat elusive, but resilience in personality may be associated with coping effectiveness. Indeed, effective coping and emotion regulation may be a central feature of EI. At a practical level, understanding the role of coping will allow support and training geared to the individual's personality across a range of applied domains.

Coping with Job Stress

Wilmar B Schaufeli, Utrecht University, Utrecht, The Netherlands

Abstract

The psychological process of dealing with job stressors in order to reduce strain or negative health effects is called coping. More specially, coping with job stress refers to mental and behavioral strategies of employees to handle the stressors they encounter at work. Coping with job stress involves the dynamic interplay of the employee and his or her job environment or work setting that is appraised as stressful in terms of harm, threat, or loss. More recent conceptualizations of coping broaden the concept by emphasizing its proactive nature, that is, the mastery of positively appraised challenging demands.

Coping with job stress is a key concept in understanding people's adaptation to their work roles. At work, employees are confronted with various kinds of demands, which may become 'stressors' when they tax or exceed the employee's adaptive capabilities. Examples of common job stressors include work overload, role problems, poor job control, lack of support from supervisors and coworkers, and interpersonal conflicts. These stressors may lead to negative psychological (e.g., depression, irritability, and burnout), physical (e.g., headaches, heart palpations, and hyperventilation), and behavioral (e.g., absenteeism, turnover, and violence) symptoms or 'strains.' The psychological process that is involved in dealing with these job stressors in order to reduce strain is called 'coping.' More specially, coping with job stress refers to the mental and behavioral strategies that employees use to handle the stressors they encounter at work.

The Concept of Coping

Rather than a homogeneous concept, coping represents a diffuse umbrella term. Nevertheless, a widely used definition of coping exists that refers to the constantly changing cognitive and behavioral efforts a person makes to manage demands that tax or exceed his or her personal resources (Lazarus and Folkman, 1984). Coping refers to a dynamic interplay between person and environment that occurs when an individual appraises a situation or an event as stressful. Applied to the work situation, this interplay involves the employee and the work setting that is appraised as stressful. It is important to note that coping refers merely to the effort made and not to the quality of the outcome. That means that coping may be either effective or successful in preventing, avoiding, or controlling individual distress or it may be ineffective or unsuccessful. For instance, compensatory or comfort behaviors such as excessive eating, smoking, drinking, or working commonly are maladaptive coping strategies. Furthermore, coping may refer to overt actions or observable behaviors as well as to covert, unobservable thoughts and events, and it may occur as a response to an event or in anticipation of upcoming demands.

The Historical Development of Coping

Initially, coping was studied from a psychodynamic point of view in the context of general human adaptation. In the first half of the twentieth century, leading psychoanalysts like Freud, Adler, and Jung described adjustment and defense mechanisms by which individuals were supposed to deal with intrapsychic conflict. Building upon this earlier work, in the 1960s and 1970s, ego psychologists distinguished between 'coping' as an advanced or mature ego process leading to successful adaptation and 'defense' as an unsuccessful neurotic mode of adaptation.

The second approach emerged from the 1960s and conceived coping in terms of personality traits. Relatively stable dispositions or coping styles (i.e., denial, repression, and vigilance) were expected to determine the individual's coping behavior across various situations. Although empirical research has shown that people possess stable and consistent coping preferences, it is likewise true that individuals are able to vary their responses to stressful situations in accordance with situational constraints and possibilities. Personality traits have made a comeback in the 1970s and 1980s as so-called personal coping resources like 'hardiness,' 'dispositional optimism,' 'self-efficacy,' and 'sense of coherence.' Such coping resources were expected to foster successful coping since the individual can draw upon them when under stress.

The currently dominant transactional approach originates from the work that Lazarus and his colleagues have performed since the 1950s. In contrast to the psychoanalytic approach, coping is defined in this approach by an effort that is independent from its success and includes proactive as well as defensive strategies. Furthermore, coping is considered to be a dynamic and transactional process involving person and environment rather than a personality disposition.

Following the emergence of positive psychology, the concept of coping has been broadened since the turn of the century and includes self-regulated goal attainment strategies and personal growth as well. In other words, coping is expanded beyond dealing with adverse events and extends to mastering challenges.

Coping has been applied to various aspects of human life. Initially, it was used predominantly in clinical and health psychology to understand how patients deal with chronic disease, substance use, loss, chronic pain, and trauma. Also, minor coping efforts involving so-called daily hassles have been identified and investigated. Coping with job stress (including unemployment) has been studied since the end of the 1970s and involves long-term chronic job stressors (e.g., future job insecurity), short-term daily hassles at the job

 http://dx.doi.org/10.1016/B978-0-08-097086-8.14010-3

(e.g., interpersonal conflict), as well as acute severe stressors (e.g., armed robbery). Most recently, ambitious goal setting and tenacious goal pursuit (e.g., learning new job skills) have been studied by way of 'positive coping,' which promotes personal growth and development (Schwarzer and Knoll, 2003).

General Coping Theory

The leading cognitive-behavioral theory of stress and coping of Richard Lazarus and his coworkers (*see* Stress, Coping, and Health) may be applied to work situations as well. It assumes that a particular situation or event is appraised negatively as being stressful in terms of threat, loss, or harm. Alternatively, the situation or event may also be appraised neutral or positive as a challenge. This so-called primary appraisal refers to the extent to which something is at stake for the person. For instance, a conflict with a colleague may threaten the employee's self-esteem, whereas unemployment is likely to be perceived as a loss of status and income. 'Secondary appraisal' refers to options the person has to cope with the harm, threat, or loss. These depend on personal characteristics, such as motivation, beliefs about oneself and the world, as well as on resources for coping such as financial means, social and problem-solving skills, particular personality traits, and a favorable work situation with social support from one's colleagues and supervisors. It is important to note that both appraisal processes, primary (demand) appraisal and secondary (resource) appraisal, are two components of one cognitive process that takes place simultaneously instead of successively.

Generally speaking, a main distinction is made between two targets: (1) instrumental, problem-focused coping, which involves attempts to deal with stress by directly altering the situation and (2) palliative, emotion-focused coping, which involves attempts to regulate the emotional responses to a stressful situation. For instance, employees might consult their supervisors after a conflict with a colleague (problem focused) or they may try to relax or divert themselves (emotion focused). In addition, various methods of coping are distinguished such as active cognitive (i.e., intrapsychic attempts to manage the appraisal of the stressor through, for instance, constructive dialogue or positive comparison), active behavioral (i.e., overt attempts to deal directly with the stressor), and avoidance (i.e., avoiding or denying the stressor). Although targets and methods of coping can be distinguished theoretically, this distinction is usually quite difficult to make at the practical level.

After the coping effort has been completed, 'reappraisal' of the initial stressful event takes place along the same lines as the original primary appraisal. The conflict with one's colleague may be solved or one may have found a new job. In that case, the reappraisal is positive and there is no need for further coping efforts. However, in case initial coping efforts failed and the event is reappraised as stressful, coping attempts continue.

Originally, Lazarus' stress and coping theory was neither applied to future demands nor to positive, challenging demands. Recently, anticipatory coping has been defined as an effort to deal with pending harm, threat, or loss; the person faces a negative event that is fairly certain to occur in the near future. In a somewhat similar vein, preventive coping is an effort to prepare for uncertain events in the longer run by building up the necessary resources. Such future-directed coping efforts seem to be particularly relevant in today's continuously changing world of work. Finally, proactive coping reflects efforts to build up general resources that facilitate promotion toward challenging goals and personal growth. Rather than by negative appraisals, proactive coping is sparked by positive challenges.

The Individual and Organizational Perspective

In Table 1, a taxonomy of individual ways of coping with job stress is displayed, including some examples of coping behaviors. Typically, in occupational settings, workplace strain and coping are individual as well as organizational issues. This means that interventions to reduce workplace strain may be targeted at the individual and/or the organizational level (Quick et al., 1997).

Interventions that focus on the individual include job stress education activities, relaxation, cognitive-behavioral programs, and employee skills training in such areas as time management and assertiveness. Interventions that focus on the organization seek to reduce strain by changing or improving the work setting (e.g., job redesign, selection and training policies, and organizational development). Although organization-based interventions offer considerable potential for reducing or eliminating

Table 1 Ways of coping with job stress

Method		Problem/task	Emotions/reactions
	Cognitive	Control (e.g., planning, organizing, and prioritizing work assignments)	Control (e.g., try to think of oneself as a winner, as someone who always comes through)
		Escape (e.g., try to pay attention only to your duties in order to overlook difficulties)	Escape (e.g., to tell oneself that difficulties are unimportant)
	Behavioral	Social (e.g., sit down with somebody and talk things over)	Social (e.g., to express one's irritation to other colleagues or to let off steam)
		Solitary (e.g., to do what has to be done, one step a time)	Solitary (e.g., spend time on a hobby)
		Control (e.g., delay or leave some of one's normal job responsibilities)	Control (e.g., show no emotional reaction and do not communicate distress to anyone)
		Escape (e.g., get busy with other things to keep one's mind off the problem)	Escape (e.g., change to nonwork activities, take pills, smoke more)

Adapted from Latack, L.C., Havlovic, S.J., 1992. Coping with job stress: a conceptual evaluation framework for coping measures. Journal of Organizational Behavior 13, 497–508.

job stressors, most workplace initiatives focus on the individual employee. That is, these interventions improve the employee's resilience by changing their maladaptive beliefs, improving their lifestyle, exercising stress management skills, and augmenting coping resources. Different individual programs are available including onsite fitness facilities, health screening, dietary control, smoking cessation, cardiovascular fitness programs, relaxation classes, stress management training, anti-burnout workshops, stress and health education, and psychological counseling. Although these activities are aimed at the individual, this does not exclude collective coping efforts (Pieró, 2008). Collective coping occurs when a group (work team, department) faces a common perceived threat or noxious situation that collectively initiates actions, for instance, by preventing, eliminating, or reducing the stressful situation, by positively reinterpreting the situation, or by alleviating its negative consequences.

Research

Earlier studies on coping with job stress often found that employees use fewer problem-focused than emotion-focused strategies directed at changing the problems encountered in the context of work. This was interpreted by noting that the very nature of problems at work is perhaps not ameliorated easily by attempts to change them. It was reasoned that employees are perhaps better off by developing a renewed cognitive perspective and by regulating their negative emotions. More recent studies, however, point to the opposite; currently employees seem to favor problem-focused coping instead of emotion-focused coping. More detailed investigations have shown that the level of job control plays a crucial role. When a high level of job control exists, problem-focused strategies prevail, but when job control is poor employees seem to favor emotion-focused strategies. Unfortunately, the latter are generally less effective compared to the former. For instance, studies on organizational changes, such as corporate restructuring and downsizing, suggest that employees cope rather poorly with these events, which are largely beyond their control. They use predominantly emotion-focused and avoidant coping strategies and suffer long-term adverse mental health.

As a general rule, a more active, problem-focused, and control-oriented coping strategy goes along with less (mental) health symptoms and higher employee well-being. In contrast, emotion-focused strategies as well as escape-oriented or avoidant strategies are usually associated with poor (mental) health and reduced well-being. However, two factors seem to be important for successful coping: time frame and availability of coping resources. It seems that emotion-focused or escape-avoidant-oriented strategies are effective when dealing with short-term stressors, whereas problem-focused and control-oriented strategies are more effective when dealing with chronic or recurrent job stressors. Furthermore, employees who have more coping resources at their disposal appear to use more active coping efforts and less avoidant coping. Consequently, employees who can draw upon coping resources are more likely to deal successfully with job stress.

Generally speaking, individual-based interventions, particularly relaxation programs and cognitive-behavioral programs (e.g., rational emotive behavior education), seem to be effective in reducing employee strain (i.e., burnout, distress, depressed mood, anxiety, and psychosomatic symptoms), whereas the effectiveness of organization-based strategies is still to be demonstrated in a convincing way.

As far as the relationship between employee coping and sociobiographical factors (e.g., age, gender, and education) and job factors (e.g., level and type of job) is concerned, no conclusive empirical evidence is available (Dewe et al., 2010). For instance, among employees no consistent gender-specific or job-specific coping patterns have been observed. Most likely, this lack of conclusive evidence has to be attributed to the complex interaction patterns that exist among the factors involved and the idiosyncratic nature of coping with job stress.

Methodological Issues and Future Directions for Research

The measurement of coping is fraught with problems that are partly due to the fact that almost exclusively self-report questionnaires are used. More specifically, empirically developed coping scales yield dimensions or coping behaviors that differ from theory-based coping scales. Furthermore, the number of coping dimensions included in various questionnaires varies (e.g., from 2 to 28), and there is no agreement either on the hierarchy of these dimensions or on the fact whether coping should be assessed as dispositional (trait) or situational (state) characteristic. Although various measures exist to assess coping with job stress, there is no 'gold standard.' Given the complexity and the idiosyncrasy of coping, a standard way of assisting it is unlikely to be ever achieved. The future research challenge is to expand coping with job stress beyond its traditional meaning of an individual reaction to adversity by exploring how employees come to grapple with (1) future job demands (anticipatory and preventive coping), (2) positive challenges (proactive coping), and (3) common job stressors (collective coping).

Core Self-Evaluations

Russell E Johnson and Chu-Hsiang (Daisy) Chang, Michigan State University, East Lansing, MI, USA

Abstract

In this article we review core self-evaluations (CSE), which refers to deep-seated evaluations that people hold of themselves. CSE is a higher order personality construct comprised of fundamental traits that have an evaluation focus and are broad in scope, such as self-esteem and generalized self-efficacy. People with high CSE have a heightened sensitivity to positive information coupled with a reduced sensitivity to negative information. CSE is an important dispositional predictor of satisfaction with one's job and life, and appraisals of one's job characteristics and social support. CSE also contributes to effective job performance behaviors at work.

A great deal of research by organizational scholars has examined how employees' personality and individual differences shape their thoughts and actions at work, especially job satisfaction and performance. Although satisfaction and performance are influenced by a myriad of external factors, such as characteristics of the job (e.g., the amount of autonomy inherent in work tasks) and social relations (e.g., fairness from supervisors), internal factors like self-esteem and emotional stability also contribute to satisfaction and performance at work (Judge and Bono, 2001). Although research on employee personality proliferated beginning in the early 1990s, a criticism of this research is that various dispositions and traits were examined in a piecemeal fashion with little attempt to consolidate and explain why they function as antecedents of job satisfaction and performance. In response to this criticism, the construct of core self-evaluations (CSE) was proposed by Judge et al. (1997).

CSE is a deep-seated evaluation that people hold of themselves, which ranges in valence from positive to negative. Evaluations of the self are thought to be the most basic appraisals that people make, which spillover to influence reactions to other people, things, and situations. Appraisals of one's job and coworkers, for example, mirror how people evaluate themselves. An employee who sees herself in a positive light will also view her work circumstances more favorably. Given its deep-seated nature, CSE is believed to underlie other dispositions and traits, which are manifestations of the latent CSE construct (Judge et al., 1997). Thus, CSE theory avoids the criticism of piecemeal research by providing an integrative framework that identifies the key criteria shared by dispositional and personality sources of job satisfaction and performance.

Three criteria are shared by traits that reflect CSE: evaluation focused, fundamental, and broad in scope. *Evaluation focused* is the extent to which traits reflect evaluations of the self as opposed to description of the self. For example, self-esteem is evaluative because it is an appraisal of self-worth (Rosenberg, 1965) whereas openness to experience is descriptive because it reflects preferences for being imaginative and intellectually curious (Goldberg, 1993). *Fundamental* is the extent to which traits are central to one's self-concept rather than peripheral. Central traits have a high degree of interconnectivity to other traits, attitudes, and perceptions. As an example, neuroticism (or its converse, emotional stability) is associated with the tendency to make negative or threatening evaluations and to experience anxious emotions (Eysenck, 1967), and it has a dense web of connections to other traits that similarly reflect sensitivities to threats and anxiety (e.g., avoidance motives; Lanaj et al., 2012). Finally, *broad in scope* refers to the breadth of the trait. Broad or global traits reflect what a person is generally like across time and different situations, whereas narrow traits are manifested only under specific circumstances.

Trait Indicators of CSE

Based on the aforementioned criteria, four CSE traits were identified: self-esteem, generalized self-efficacy, emotional stability, and locus of control (Judge et al., 1997, 1998b). *Self-esteem* refers to a person's overall appraisal of their personal and social worth (Rosenberg, 1965). Self-esteem is a fundamental evaluation that predicts a variety of attitudes and behaviors at work (Pierce and Gardner, 2004). *Generalized self-efficacy* is an evaluation of one's ability to perform well and cope successfully across a range of situations (Chen et al., 2004). In contrast to self-esteem, generalized self-efficacy is an appraisal of one's capabilities rather than self-worth. *Emotional stability* is the tendency to avoid making negative evaluations and experiencing anxious emotions (Eysenck, 1967). People who score high on emotional stability view themselves and their environment in a positive light and are not overly sensitive to perceiving threats. *Locus of control* is an evaluation of whether or not one's behavior is capable of altering the environment in desired ways (Rotter, 1966). Employees with an internal locus of control believe they can shape work events, which elicits positive reactions toward their job (Spector, 1982).

Empirical evidence appears to support the status of these four traits as indicators of an underlying CSE construct. For example, meta-analytic results indicate that the four traits are highly correlated with one another (Judge et al., 2002). The average meta-analytic estimate is $\rho = +0.60$, with the strongest relationship between self-esteem and generalized self-efficacy ($\rho = +0.85$) and the weakest relationship between emotional stability and locus of control ($\rho = +0.40$). Factor analytic results also suggest that the four traits load on a single higher order latent construct (e.g., Erez and Judge, 2001). Self-esteem and generalized self-efficacy have the highest loadings on the construct, whereas locus of control

has the lowest. That the four traits share a common underlying core is also hinted at by research examining relationships of the traits with outcomes. Self-esteem, generalized self-efficacy, emotional stability, and locus of control all have comparable correlations with job satisfaction and performance (Judge and Bono, 2001), and the individual traits do not appear to be more predictive of outcomes than the shared variance between them (Judge et al., 2003).

Despite this supportive evidence, some issues regarding the structural validity of the higher order CSE construct have been identified (Chang et al., 2012; Johnson et al., 2008). One issue pertains to possible errors of omission. That is, besides the four traits mentioned above, other traits also appear to be evaluation focused, fundamental, and broad in scope. For example, trait optimism causes people to evaluate experiences in a positive light via the favorable attributions they make (e.g., optimistic employees attribute positive events like promotions to internal and stable causes; Gillham et al., 2001). Similarly, traits that reflect an approach temperament, such as positive affectivity and extraversion, elicit positive evaluations of one's self and the environment (Johnson et al., 2008). It has therefore been proposed that optimism and positive affectivity, as well as other candidate traits (e.g., conscientiousness, negative affectivity), also warrant consideration as indicators of CSE (Bono and Judge, 2003; Johnson et al., 2008).

A second issue pertains to possible errors of commission. In particular, the status of locus of control as an indicator of CSE has been questioned for both conceptual and empirical reasons. Conceptually, locus of control is more reflective of beliefs about the controllability of the environment rather than evaluations about one's capabilities. People with an internal locus of control believe the environment is responsive to their actions, whereas those with an external locus attribute events and outcomes to chance (Rotter, 1966). Although locus of control is a core evaluation, it is not necessarily a core evaluation about the self. Empirically, locus of control has the weakest correlations with the other CSE traits and the lowest loading on the latent CSE construct (Johnson et al., 2008; Judge et al., 2002). In fact, when the traits are measured using techniques that reduce biased responding due to social desirability and mood, locus of control no longer correlates with the other traits nor does it load on the CSE construct (Johnson et al., 2011). There is therefore need for additional research that evaluates the status of the aforementioned traits as indicators of the CSE construct.

A final issue is the need to establish the nature of the relationship between the latent CSE construct and its trait indicators, of which there are two possibilities. One possibility is that the underlying CSE construct is responsible for people's standing on each trait, where the direction of causality flows from CSE to the traits. According to this view, CSE is a superordinate construct with effects indicators, and the traits are manifestations of CSE and interchangeable with one another (Johnson et al., 2012). An example of a superordinate construct is general cognitive ability, which fuels people's lower level verbal, quantitative, and analytic abilities. Another possibility is that CSE is a formative construct such that the traits are causal indicators and the direction of causality flows from the traits to CSE. An example of a formative construct is socioeconomic status, which is the sum of earners' household income, education, and occupation. Although the contemporary view is that CSE is a superordinate construct, this view has received criticism because the traits are not interchangeable nor do they have identical antecedents (Johnson et al., 2008). For example, past success is a key driver of self-esteem and self-efficacy, whereas emotional stability is rooted more in neurological systems.

In sum, the significant overlap among various self-evaluative traits suggests the existence of a latent CSE construct, but further research is needed to confirm the full set of trait indicators and the nature of the relationship between the CSE construct and its traits (Chang et al., 2012). Identifying the correct traits is necessary in order to properly model the latent CSE construct, and verifying whether CSE is a superordinate or formative construct is necessary because empirical findings are biased when latent constructs are misspecified (Johnson et al., 2012).

Measuring CSE

Given that CSE is a latent construct comprised of multiple trait indicators, there are different approaches for measuring CSE (Chang et al., 2012). Initial research utilized indirect approaches in which the traits are measured separately and then used to estimate people's CSE. One way is to aggregate all of the item-level data from the trait scales into an overall score. Alternatively, trait scores can first be computed and then aggregated into an overall score. These indirect approaches have two major drawbacks. First, CSE reflects the shared variance among the traits, but aggregating item- or trait-level data into an overall score mixes together the shared variance among the traits and the unique variance associated with each trait. The unique variance does not reflect CSE, thus it should not be included. Second, computing a simple sum or average of the data is problematic because it gives equal weight to the traits. As mentioned above, this assumption is incorrect: self-esteem and generalized self-efficacy have the highest loadings on the construct, followed by emotional stability and then locus of control. Thus, aggregating the data biases the CSE construct by overestimating the contribution of locus of control and emotional stability.

A better indirect approach is to model CSE as a higher-order latent factor via factor analysis and structural equation modeling. This approach is advantageous because it distinguishes between shared and unique variance, and only the shared variance is used to generate the CSE factor. Thus, traits with weaker relations to the CSE construct (locus of control and emotional stability) do not unduly bias the CSE factor. Another advantage of modeling CSE as a higher order latent factor is that the strength of the relationship that CSE has with other variables (e.g., job satisfaction) can be compared to the strength of the relationship that each trait has with the same variable. Doing so enables researchers to evaluate the utility of the higher order CSE construct vis-à-vis the lower order traits. When individual traits have greater predictive validity, it is more appropriate (and parsimonious) to examine the traits rather than the latent construct (Johnson et al., 2012).

CSE can also be measured via a direct approach, which involves creating survey items that specifically tap the underlying CSE construct. A popular direct measure is the Core Self-Evaluations Scale (CSES; Judge et al., 2003) that includes items spanning multiple traits. The primary advantage of direct measures is their short length (e.g., the CSES has 12 items whereas measuring the individual traits separately has anywhere from 20 to 40 items). Direct measure are, however, limited in that they do not preserve the trait structure of CSE, making it impossible to assess the utility of the higher order CSE construct against the lower order traits. This tradeoff can be balanced by developing indirect measures with fewer items per trait (e.g., measuring each trait with 4 items would only require 16 items). Indirect measures are preferable because they allow researchers to tease apart variance that is shared versus unique to each trait (Johnson et al., 2012).

Core Self-Evaluation and Its Outcomes

CSE has proved to be a useful predictor of job satisfaction and performance, among other affective, cognitive, and behavioral outcomes. It was proposed that CSE may influence outcomes through four processes (Judge et al., 1997). First, the positive self-views associated with high CSE may directly influence outcomes through positive emotional generalization. Next, CSE may influence outcomes by altering the cognitive appraisals that individuals make about the characteristics of their environment. Third, CSE may influence outcomes by influencing the actions that individuals engage in. Finally, CSE may moderate relationships between events and individuals' reactions (e.g., negative events are less detrimental to well-being when CSE is high).

More recently, scholars (Chang et al., 2012; Ferris et al., 2011, 2013) have integrated CSE with the approach/avoidance framework to provide a comprehensive theoretical framework for explaining the effects of CSE. This framework suggests that individual traits can be characterized by the extent to which they represent tendencies to approach positive stimuli versus avoid negative stimuli (Elliot and Thrash, 2002). These differences in sensitivities toward positive (approach orientation) and negative (avoidance orientation) information have implications for individuals' affect, cognition, and behavior. An approach orientation leads individuals to experience emotions ranging from elation to depression, focus more on positive information when evaluating a given situation, and adopt goals that are directed toward pursuing desirable outcomes (Elliot and Thrash, 2002; Johnson et al., 2013). In contrast, individuals with an avoidance orientation tend to experience emotions ranging from relief to anxiety, pay more attention to negative information, and adopt goals for avoiding undesirable outcomes. Consistent with an approach/avoidance framework, meta-analytic findings verify that CSE has positive relationships with approach-oriented traits like positive affectivity ($\rho = +0.61$) and approach motives ($\rho = +0.32$), whereas it has negative relations with avoidance-oriented traits like negative affectivity ($\rho = -0.60$) and avoidance motives ($\rho = -0.54$). Below we summarize research evidence relating CSE to various work-related outcomes, organized by the affective, cognitive, behavioral, and moderation processes discussed by Judge et al. (1997).

Affective Outcomes

Individuals with high CSE are likely to experience positive spillover effects from self-views to evaluations of their environment. Moreover, owing to high approach and low avoidance orientations, high-CSE individuals pay closer attention to positive aspects of their daily encounters, thus experiencing positive emotions such as excitement. CSE is therefore positively related to job satisfaction (i.e., a positive emotional state resulting from one's job and experiences at work) and affective organizational commitment (i.e., accepting organizational goals, exerting effort on behalf of the organization, and maintaining membership in the organization; Meyer and Allen, 1997). Meta-analytic findings confirm that CSE is positive related to these outcomes ($\rho = +0.36$ for job satisfaction; $\rho = +0.30$ for affective commitment; Chang et al., 2012).

In addition to positive feelings about their jobs and organizations, high-CSE individuals also report high life satisfaction ($\rho = +0.54$). This may reflect their general sensitivity toward positive events, as well as their higher optimism and resilience. Meta-analytic results indicate that CSE is negatively associated with stress-based reactions like psychological strain (e.g., negative emotions: $\rho = -0.49$) and physical strain (e.g., psychosomatic symptoms: $\rho = -0.42$).

Cognitive Outcomes

Beyond emotional generalization, CSE may also influence outcomes via cognitive appraisals. Specifically, when evaluating environmental characteristics, high-CSE individuals tend to hold positive appraisals of their environment and rarely view circumstances as threatening or overwhelming. For example, CSE has significant, positive relationships with perceived job characteristics ($\rho = +0.39$), such that jobs are viewed as having high autonomy and opportunities to demonstrate one's knowledge and skills (Chang et al., 2012). High CSE is also related to more favorable appraisals of fairness ($\rho = +0.15$) and perceived support from companies ($\rho = +0.32$), supervisors ($\rho = +0.23$), and coworkers ($\rho = +0.28$; Chang et al., 2012). Moreover, meta-analytic evidence also suggests that CSE is negatively related to perceptions of job stressors (Chang et al., 2012), including role ambiguity ($\rho = -0.45$), interpersonal mistreatment ($\rho = -0.23$), perceptions of organizational politics ($\rho = -0.25$), and work–family conflict ($\rho = -0.28$). These results are consistent with the theoretical linkage between CSE and low avoidance orientation, such that high-CSE individuals are less sensitive to negative aspects of their environment.

Behavioral Outcomes

CSE also influences the types of actions that employees engage in. In employment settings, three types of behaviors receive the most research attention: task performance, organizational

citizenship behavior (OCB), and counterproductive work behavior (CWB). Task performance refers to work behaviors that contribute to the technical core of the organization, such as the production of a product or delivery of a service (Borman and Motowidlo, 1997). OCB includes actions that contribute positively to the general social and psychological environment at work, such as helping coworkers, participating in voluntary committees, and defending the company's reputation to outsiders (Borman and Motowidlo, 1997). CWB refers to actions that harm the organization or its members, such as sabotage, theft, and interpersonal mistreatment (Spector, 1997).

Task performance and OCB are approach-oriented behaviors that contribute positively to the organization and its members. As such, high-CSE employees are expected to exhibit higher task performance and OCB. On the contrary, CWB is often the result of experiencing negative emotions and perceiving stressors, which are associated with an avoidance orientation. Thus, high-CSE employees should be less likely to engage in counterproductive behaviors. Meta-analytic results are consistent with this line of reasoning (Chang et al., 2012). Specifically, CSE has positive relations with task performance ($\rho = +0.19$), and with OCB directed at coworkers ($\rho = +0.20$) and the organization ($\rho = +0.30$). In contrast, CSE has negative relations with CWB directed at coworkers ($\rho = -0.16$) and the organization ($\rho = -0.28$). Taken together, high-CSE employees contribute positively to their organizations by fulfilling their job responsibilities and improving the social and psychological environment, and by refraining from harmful and counterproductive acts.

Mediating Effects

In addition to direct effects of CSE on outcomes, a number of empirical studies have examined how cognitive appraisals and goal-related actions mediate the effects of CSE. For example, high-CSE employees tend to make more positive evaluations of their job characteristics and environment, which in turn result in higher job and life satisfaction (Judge et al., 1998a). As another example, CSE also has positive effects on job satisfaction and affective commitment via the upward and downward comparisons that employees make with coworkers (Brown et al., 2007). In addition to cognitive appraisals, goal-based variables have been examined as mediators of the effects of CSE. One such mediator is setting performance goals, such that high CSE leads to stronger goal setting motivation which in turn leads to higher task performance (Erez and Judge, 2001). Job engagement (i.e., the devotion of physical, attentional, and affective resources toward one's work-related goals) has also been found to mediate the effects of CSE on task performance as well as OCB (Rich et al., 2010). Finally, Ferris et al. (2011) examined the work-based approach and avoidance motivations as mediators of the effects of CSE on employee performance. Consistent with the integrated theoretical framework discussed above, CSE had positive, indirect effects on task performance and OCB, and negative indirect effects on CWB via approach and avoidance motivations.

Moderating Effects

A fourth process through which CSE may influence outcomes is by moderating employees' reactions toward environment stimuli, including stressors and job characteristics. For example, scholars have argued that CSE is an important personal resource that enables employees to effectively cope with stressors. High CSE may provide individuals with a strong sense of control and a positive outlook for their coping efforts, thus high-CSE individuals experience less detrimental effects when faced with potential stressors. Empirical studies has provided support for the buffering effects of CSE, such that social stressors (Harris et al., 2009) and organizational constraints (Best et al., 2005) have weaker negative effects on employees' well-being when CSE is high (vs low). Unfortunately, the buffering effects of CSE appear inconsistent, such that some scholars failed to find any buffering effects (e.g., Kammeyer-Meuller et al., 2009), whereas others found that high CSE actually enhanced the negative effects of stressors on employee performance (Kacmar et al., 2009).

In addition to moderating the effects of stressors, CSE also shapes the effects of perceived job characteristics on outcomes. In support of the view that the positive aspects of one's job are more salient for high-CSE employees, it was found that high CSE strengthened the relationship between perceived job characteristics and organization-based self-esteem (Pierce and Gardner, 2009). However, similar to above, these moderating effects are also inconsistent. While some studies failed to find a moderation effect (Judge et al., 1998a), others have observed that low CSE strengthened the beneficial effects of job characteristics (Ng and Feldman, 2010). Taken together, the moderating role of CSE remains unclear.

Additional Issues Concerning CSE

As highlighted in this review, some questions about CSE remain. Some of them pertain to the structural validity of the construct, such as whether additional traits (e.g., optimism) should be included as indicators, whether existing indicators should be excluded (e.g., locus of control), and whether CSE is a superordinate construct with effects indicators or a formative construct with causal indicators. There is also room to improve how CSE is measured, such as by developing shorter indirect measures with specific items that assess each trait. Besides these issues, which were already covered, we discuss two additional ones below.

The first issue is in regards to possible drawbacks of having high levels of CSE. The meta-analytic review of the CSE literature by Chang et al. (2012) clearly indicates that CSE contributes in favorable ways to numerous outcomes, including employee satisfaction, well-being, and performance. It has been suggested, however, that especially high levels of CSE may be too much of a good thing (Hiller and Hambrick, 2005). For example, excessive CSE may give rise to unrealistically high levels of overconfidence and personal control over the environment. Thus, high-CSE people may be prone to suboptimal performance and decision-making by not exercising due diligence when gathering and analyzing available data. Excessive CSE may also cause individuals to disregard the

advice of other people as well as information from other external sources (e.g., market reports, financial indicators). If they ignore external sources of information, especially when it is inconsistent with their personal views, then high-CSE individuals will fail to adapt to changing circumstances and instead persist in less effective (or even destructive) courses of action. This logic suggests that CSE may have curvilinear relationships with performance, such that performance improves as CSE increases from low to high levels, but performance will begin to deteriorate at especially high levels of CSE (an inverted-U pattern). Research is needed that explores possible links of excessive CSE with the behavioral consequences of overconfidence and hubris (Hiller and Hambrick, 2005).

A second issue is to explore the utility of CSE for human resource management. Although research on CSE originated in the organizational and behavioral sciences, little work has explored the potential of CSE to inform practice. Given the significant relationships of CSE with multiple aspects of job performance (e.g., task performance, OCB, and CWB), assessing CSE as part of the selection process may improve the accuracy of hiring decisions. What first needs to be determined, however, is whether CSE predicts variance in job performance incremental to other established predictors, such as cognitive ability and conscientiousness. An initial evaluation of CSE's utility for selection is unclear at this time because its relationships with other established predictors are small in some cases ($\rho = +0.12$ with cognitive ability) but large in others ($\rho = +0.49$ with conscientiousness; Chang et al., 2012). Thus, CSE may not explain much incremental variance in job performance beyond predictors like conscientiousness.

The appropriateness of CSE for selection purposes also depends on other factors. For example, hiring people based on CSE scores would not be recommended if doing so results in high adverse impact (i.e., disproportionately fewer people of a particular race, sex, or ethnicity group are selected). Hiring based on CSE scores would also be problematic if applicants are prone to fake responses on measures of CSE. This is a real concern for CSE because people are especially motivated to paint a desirable picture of themselves when responding to self-evaluative items (Crampton and Wagner, 1994). Consistent with this idea, preliminary empirical evidence suggests that scores on CSE measures are biased to some extent by social desirable responding (Johnson et al., 2011). Thus, before CSE can be incorporated into selection practices, more work is needed concerning its incremental validity vis-à-vis other predictors, the extent to which it creates adverse impact, and the extent to which applicants are motivated and capable of faking on CSE measures.

Another human resource function that CSE may impact is performance management. Key ingredients that drive effective performance appraisal systems are goal setting and feedback. First, employees with high CSE may be prone to setting more difficult goals for themselves and view challenging tasks as opportunities to learn. Indeed, Chang et al.'s (2012) review concluded that CSE is positively related to goal difficulty ($\rho = +0.22$), goal commitment ($\rho = +0.42$), and learning goal orientation ($\rho = +0.33$). Thus, high levels of CSE start employees off on the right foot when it comes to goal setting and striving. Second, high levels of CSE may also facilitate the feedback process that follows goal setting and striving. For example, owing to their positive self-regard, employees with high CSE may respond more constructively to negative performance feedback because they believe themselves capable of altering their behavior and/or the work environment to make the necessary improvements. Their positive self-regard may also give employees the confidence to seek feedback from others, especially negative feedback, and then use that feedback as a launching point for self-development. Employees with low CSE, in contrast, tend to shy away from negative feedback and avoid difficult tasks that draw attention to deficiencies in their knowledge and skills (the very same tasks that, ironically, would help them improve their knowledge and skills). Taken together, more attention ought to be paid to the practical implications of CSE for human resources management.

Conclusion

CSE, which refers to deep-seated evaluations that people hold of themselves, is a higher order latent factor comprised of fundamental traits that have an evaluative focus and are broad in scope (e.g., self-esteem and generalized self-efficacy; Judge et al., 1997). People with high CSE have a heightened sensitivity to positive information (i.e., strong approach motivation) coupled with a reduced sensitivity to negative information (i.e., weak avoidance motivation). Thus, it is not surprising that CSE is related to higher satisfaction with one's job and life, more favorable appraisals of job characteristics and social support, and less strain and psychosomatic symptoms (Chang et al., 2012). CSE also contributes to effective behaviors at work and reduces destructive behaviors. Although there are some issues concerning the nature and measurement of CSE that require attention (Chang et al., 2012; Johnson et al., 2008), CSE is a useful higher order personality construct that sheds light on the dispositional sources of work attitudes, well-being, and behavior.

Core–Periphery Patterns in Networks

Martin G Everett, University of Manchester, Manchester, UK

© 2015 Elsevier Ltd. All rights reserved.

Abstract

A network has a core–periphery structure if it consists of two groups of actors, core actors who interact mainly with other core actors and peripheral actors who connect to the core but do not interact among themselves. We examine techniques designed to uncover core–periphery structures in networks. There are two distinct approaches, the first is to try and find a bipartition of the network, which optimizes a fit function designed to capture the ideal structure. The second is to derive a coreness score for each actor that captures the extent to which they are a core or a peripheral player.

Introduction

Core–periphery patterns in the context of social networks were initially discussed without any recourse to a formal definition. They were informally discussed in a variety of studies such as national elites and collective action (Laumann and Pappi, 1976; Alba and Moore, 1978), citation networks (Mullins et al., 1977; Doreian, 1985), interlocking directorates (Mintz and Schwartz, 1981), and primates (Corradino, 1990). All of these informal ideas shared the intuition of dividing the nodes into two groups namely the core and the periphery. The concept was examined in more detail by Borgatti and Everett (1999) and although they suggested their paper should be the starting point of a methodological debate on what constitutes a core–periphery their formulation has come to be the accepted standard. The simplest way to envisage their definition is in terms of a block model. Given a network with an adjacency matrix in which the rows and columns have been arranged so that the core nodes are followed by the peripheral nodes then the core–periphery partition gives rise to four blocks as depicted in **Figure 1**. The core block contains the core to core interactions, the peripheral block contains the periphery to periphery interactions with the two off-diagonal blocks containing the core to periphery and the periphery to core interactions. In an undirected network the two off-diagonal blocks are simply the transpose of each other.

In a core–periphery structure, we expect core nodes to be well connected to other core nodes and we would also expect peripheral nodes to not be connected to other peripheral nodes. Given this the perfect core–periphery structure for a binary network would be a one block as core, that is a block consisting entirely of ones (except possibly the diagonal) and a zero block as peripheral, that is a block consisting entirely of zeros. Here we are using the terminology of block models where the one and zero blocks are the only permissible building blocks of structural equivalence. Suppose that our network is undirected, if we maintain structural equivalence as our underlying model then the core–periphery block can only be a zero block or a one block. If it were a zero block then the ideal structure would have a clique as a core with isolates as a periphery. It is true that some researchers are quite content to have isolates in the periphery but the majority feel that this does not really capture the core–periphery concept, since we expect the periphery to be related in some way to the core. That is the nodes are peripheral to a defined core and are not simply just peripheral, this provides a distinction between a peripheral node and an isolated node. If we retain the structural equivalence model then the core–periphery blocks must be one block. This implies the rather strict condition that every peripheral member is connected to every core member. The network shown in **Figure 2** has this structure with nodes 1, 2, 3, and 4 in the core and the remainder in the periphery.

	Core nodes	Peripheral nodes
Core nodes	Core	Core–periphery
Peripheral nodes	Periphery–core	Peripheral

Figure 1 Core–periphery block model structure.

Figure 2 A simple core–periphery structure.

Clearly such idealized patterns are not likely in real data and so we usually look to relax the conditions. One approach is to only consider the core and periphery blocks and in essence ignore the off-diagonal blocks. In so doing, it would make sense to at least insist on some core–periphery interaction, and this can be achieved by making sure that the network is connected if it is undirected or weakly connected if it is directed. In examining relaxations from the ideal Borgatti and Everett proposed two models, the discrete model and the continuous model, which we shall now consider these in more detail.

Discrete Model

A simple description of the discrete approach is to assign each node to either the core or the periphery so that the resultant matrix is as close as possible to the block model described in **Figure 1**, which we shall now refer to as the structure matrix. The first issue is to find a measure that captures how close two matrices are to each other. There are a number of possibilities but two have been extensively used in the development of methods and in applications. The first is to use Pearson correlation that is to correlate the structure matrix with the data matrix. In this case we use a modified structure matrix and treat the core–periphery and periphery–core blocks as missing values. The second method is to simply count the number of errors, that is, the number of times the data matrix has a zero when the structure matrix has a one and the number of times the data matrix has a one when the structure matrix has a zero, sometimes referred to as the Hamming distance. Again we do this just for the core and the peripheral blocks and we ignore the two off-diagonal blocks. Both measures try to assess the extent to which the core is well connected and the periphery is sparsely connected. Once we have a measure of how good a partition is we can try and optimize this over all possible partitions. It is simply not possible except for very small networks to look at every possible assignment into core and periphery and so we need to use combinatorial optimization techniques or other heuristic methods. There are a number of possible methods designed for solving such problems and a comparison of the techniques was undertaken by Boyd et al. (2006). They found some subtle differences on the quality of solutions but with any major differences probably attributable to different implementations rather than any fundamental advantages. This is in keeping with most findings in this area. They did find that a Kernighan–Lin type algorithm developed by them was the fastest but this is an area of continuous development and most users would not need to concern themselves with the underlying solution method.

As an example of this approach, we take the citation data among the top social work journals in a 1-year period (1985–86) reported by Baker (1992). These data record if one journal cites another journal during the period. The results of the core–periphery using the correlation method in UCINET (Borgatti et al., 2002) are given in **Figure 3**.

We note that the journals do cite articles within themselves and this produces the ones down the diagonal but the algorithm ignores these. The correlation between the data matrix given in **Figure 3** and the idealized block structure is 0.81, which indicates a strong core–periphery structure. The core block has a density of 0.86 and the peripheral block has a density of 0.05 indicating even more strongly the core–periphery structure of this data in which core journals cite other core journals and peripheral journals do not cite other peripheral journals. This is further reinforced by examining the two off-diagonal blocks. The top right core–periphery block has a density of 0.15, whereas the bottom left periphery to core block has a density of twice that at 0.32. This shows that

Figure 3 Discrete core–periphery analysis of citation data.

peripheral journals cite twice as many core journals as core journals cite peripheral journals providing further evidence of the hierarchical structure of the journals.

As already discussed, an alternative measure to correlation is to use the Hamming distance. This was suggested by Brusco (2011) although it had already been implemented in UCINET many years earlier using the same genetic algorithm as is used for the correlation method. Brusco proposed an exact algorithm based on branch and bound techniques using this measure. As it happens, if we use the Hamming distance then the problem can be solved very efficiently in polynomial time. This result is due to a theorem by Hammer and Simeone (1981) that implies for undirected data that all we need to do to find the best fit is to order the vertices in decreasing order of degree. We then just need to find a threshold value for the degree and every node with degree above the threshold will be a core node and the rest will be peripheral and this can be done efficiently. This result requires a trivial modification to deal with directed data.

This technique is straightforward and would seem to be the best approach. If we apply this method to the citation data given in **Figure 3**, for example, we obtain exactly the same results. But this approach does have a few problems. First it cannot be directly applied to valued data whereas the correlation method can. Second, and more importantly, it does not give information about the core–periphery structure of the network. It is quite possible for the best assignment of nodes to a core and periphery structure measured in this way to result in a core block that is a zero block or has very few entries. To see this, consider the following example by Brandes (personal communication). Start with a path of 11 nodes numbered in sequence so that 1 and 11 are the end nodes. To each even numbered node attach 9 pendants so that each even node has degree 11. The result will be a graph with 56 nodes, 5 with degree 11, 4 with degree 2, and 47 with degree 1. Consider the partition in which the five nodes with degree 11 are in the core and the rest are in the periphery. Since the only connections are between core and periphery both the core block and the peripheral block are zero. As a consequence the Hamming distance will be 20. Moving a core node into the periphery will create a Hamming distance of 22, moving a degree 2 vertex into the core will create a Hamming distance of 26. The best solution is therefore our original split in case we are left with a core, which is a zero block.

This example does not mean the Hamming distance should not be used but it should be used with care and only be used when computationally the correlation method is not feasible. When it is used the user needs to make sure that they have a structure, which intuitively fits the core–periphery criteria.

Continuous Model

One further issue with the discrete model is that it places nodes either in the core or in the periphery and this may be too simplistic. Some authors have suggested the idea of a semi-periphery, which is equivalent to introducing more blocks into the block structure. The problem with this is that it increases the complexity of the problem and it becomes even more difficult to decide on the nature and structure of the additional blocks. An alternative formulation is to try and find a node level measure of the amount of core–periphery. We have already seen that degree centrality does precisely this for the Hamming distance. High degree actors must be in the core, low degree actors are in the periphery, and actors who are close to the boundary value would be in the semiperiphery or on the edge of the core. But as we have seen degree is not always a good measure and does not extend to valued data. To overcome this, Borgatti and Everett suggest using ideal structure matrix Δ constructed as the outer-product of a vector $\mathbf{c}$ of coreness values as shown in eqn [1].

$$\Delta = \mathbf{c}\mathbf{c}^{\mathrm{T}} \qquad [1]$$

In this equation the i, jth entry of the matrix Δ is simply the product of $\mathbf{c}_i$ with $\mathbf{c}_j$. If two nodes have a high coreness score then their product and hence the corresponding value in Δ will be high. If both entries are low then the product will be low and so the corresponding value in Δ will be low. If one is high and one is low the corresponding Δ value will be intermediate. In the extreme case in which we constrain the entries of $\mathbf{c}$ to be either 0 or 1, then Δ would correspond exactly to a block model structure of core–periphery as in the discrete case and $\mathbf{c}$ would be an indicator vector where a value 1 would indicate a core node and 0 a peripheral node. It follows that our discrete method can be formulated as finding a binary vector $\mathbf{c}$ in which the correlation between our data matrix A and our product matrix Δ is as large as possible. If we now relax the condition that $\mathbf{c}$ is binary and allow $\mathbf{c}$ to take on any positive values we obtain the continuous core–periphery model. The values of $\mathbf{c}$ now give the coreness of each node within the network. This generalization from the discrete to the continuous is remarkably similar to the extension of degree centrality to eigenvector centrality. As already mentioned, the degree centrality can be thought of as a coreness measure when we use the number of changes measure of fit for core–periphery and eigenvector serves a similar purpose for the continuous approach. (In fact if we use Euclidean distance between matrices instead of correlation then this similarity becomes explicit providing we include the diagonals.) Applying the continuous method to the citation data used for the discrete method in **Figure 3** yields the results given in **Figure 4**.

The two columns are the split between core and periphery recommended by the software. This recommendation is based on correlating the scores above with an ideal set of scores where core members score a value of one and peripheral members score a value of zero. This is then examined for all possible core sizes from 1 to $n - 1$ and the recommended split is the highest correlation from these $n - 1$ values. In this case a vector of eight ones is followed by 12 zeros. This measure is called the concentration. If we compare this output to the one in **Figure 3**, we see that they have six journals in common. We note that ASW is the highest scoring peripheral journal and that the discrete method has this journal in the core. Two journals that were peripheral for the discrete method, namely SWG and CYSR, are placed in the core. Looking at the discrete output we see that these are the only journals with multiple peripheral block entries. There is also one further important characteristic of the continuous method, the matrix Δ must be by definition symmetric. It follows that the continuous method, which must take account of the off-diagonal blocks, cannot differentiate between core–periphery and periphery–core interaction. As

Figure 5 Core–periphery layout of citation data.

a consequence it is far better suited to symmetric data (or at least data that is very nearly symmetric). In fact if the two methods are compared on symmetrized versions of the citation data they are in complete agreement.

The above example uses correlation but we could use the sums of square differences as our measure of association. If we include the diagonal as zeros then this is the same as finding the principal eigenvector. If we ignore the diagonals then this is the same as the MINRES (MINimal RESiduals) procedure developed by Harman (1967) and Comrey (1962) in a different context. Boyd et al. (2010) have extended this approach and suggest using an MINRES Singular Valued Decomposition (SVD). This has the advantage of being able to deal with asymmetric data and at the same time introducing meaningful (imputed) values on the diagonal. In this case they produce both in and out coreness scores, which can be used to define cores and peripheries.

The continuous model has one other advantage over the discrete model in that we can use the coreness values to order the nodes to obtain good visualizations. If we submit Δ to a metric mds then use this output to position the nodes we will obtain a network in which the nodes in the core will be placed at the center and the nodes in the periphery will be around the outside. We can then immediately see which nodes are on the edge of the core or part of the semiperiphery particularly if we shape or color the nodes that are in the recommended core. We have done this for the citation data and the results are shown in Figure 5 with core nodes as gray squares and peripheral nodes as black circles.

The position of the core journals in the center and the strong connections between them are apparent. In addition, we see that ASW is placed near to the core and so must be close to being considered a member of the core, in addition SWG, JSWE, and SWRA are clearly on the edge of the core and are close to being in the periphery.

Boyd et al. use the **c** values to order the nodes in an adjacency matrix and use a density plot to display the values in the data.

Extensions

One issue we have not considered is trying to assess statistically whether the data actually has a core–periphery structure. Boyd et al. (2006) describe a generic permutation test that can be applied to the discrete case. Their approach is computational intensive since they propose permuting the data and a running a discrete core–periphery optimization routine after each

permutation. This is repeated thousands of times to obtain a distribution of the fitness function. It was for this reason that they were keen to develop a heuristic that was accurate and fast. Rather than permuting the rows and columns they propose a permutation that preserves the cell distribution, which also preserves the total number of ties. This means that row and column marginals are not preserved. They also propose a similar approach to assess the result of their MINRES/SVD approach (Boyd et al., 2010). Again it is necessary to run the continuous optimization routine after each permutation. In this instance, they propose permutations that preserve both transpose pairs and the ordering implied by **c**.

In the previous section, we discussed a number of possible measures for assessing the similarity of the data to ideal structure matrices. It is quite possible to substitute any number of different functions such as chi-square measure or a log-likelihood. Muñiz and Carvajal (2006) suggest using an entropy type measure.

So far we have only considered single mode data. The ideal structure matrix is simply a nonsquare version of the structure matrix for one mode data. The only difference is that the blocks themselves are not square and so the partitioning of the columns is independent of the partitioning of the rows. Extending the discrete model is therefore straightforward but the fact that the rows and columns are partitioned independently means that this is computationally much more difficult. Everett and Borgatti (2013) suggest that it is better to apply the discrete method using correlation (or any other method that works on valued data) to the two projections AA^T and A^TA and then use these results to partition the rows and columns of A. They refer to this as the dual projection method. **Figure 6** gives the results of doing this using the discrete correlation method in UCINET on the Southern Women data (Davis et al., 1941).

We see in these data that the core group of women attend most events and that the core events are attended by most women but that the peripheral events are sparsely attended by the peripheral women.

The same approach can be used for the continuous method. That is we can apply the continuous method to the two projections and so have two sets of coreness scores one for each mode. If we used minimizing the sums of squares as our measure (including the diagonals), then the coreness scores would be the same as the **u** and **v** scores of a singular valued decomposition. For this reason it would be just as appropriate to use the MINRES/SVD approach discussed above on two mode data as these gives two separate coreness scores.

Software, Applications, and Scalability

The only software package that contains both the discrete and continuous methods is UCINET (Borgatti et al., 2002). The discrete method uses a generic algorithm and not the Kernighan and Lin type algorithm. At the time of writing UCINET does not include the permutation tests or the MINRES/SVD extensions suggested by Boyd. Boyd uses mathematica (Wolfram, 2003) in both his extensions and gives the commands required for those familiar with the software. Pajek (Batagelj and Mrvar, 1998) has the facility to have prespecified block models and hence the core–periphery structures can be specified and this provides an alternative algorithm for the discrete model. Since eigenvectors or singular vectors can be viewed as coreness type measures (although the fact they include the diagonal could be seen as an issue), these can be used and are available in a large variety of mathematical and statistical software packages.

Examples of applications can be seen in a variety of disciplines and the benefits and disadvantages of core–periphery structures have been extensively examined. In addition to the earlier work already mentioned Cattani and Ferriani (2008)

look at the core–periphery structures in the Film Industry, Bodin and Crona (2009) examine natural resource governance and Crowston et al. (2006) analyze open source software team communication. These are just a few examples chosen from an increasing and diverse literature on the subject.

The fact that we are now able to collect and analyze very large data sets presents issues of scalability. Most of the work on core–periphery structures is premised by the idea that the network is a social network with a cost to maintaining links. It is also assumed that the core is such that it is well integrated and two core actors are at most one or two steps apart. If we wish to consider networks such as the World Wide Web or even those generated by social networking sites such as Facebook, then this concept would need to be reconsidered. One approach is to look for multiple core–periphery structures; this was first suggested by Everett and Borgatti (1999) and has been developed in the context of larger networks by a number of authors see Holme (2005), for example. The basic idea is to define the cores in terms of cohesive subgraphs and then trace the peripheries associated with the cores. The use of k-cores (a group of vertices in which every vertex is connected to k or more other members of the group), which can be quickly and easily detected in large complex networks are a useful starting point.

Abstract

Coronary heart disease (CHD) is a major cause of death and disability in the modern world. It is a multifactorial condition, and there is growing evidence that psychosocial factors are relevant. The factors involved include exposure to adversities such as chronic stress, impoverished social relationships leading to isolation and loneliness, and emotional conditions including depression and hostility. Psychosocial factors are relevant at several stages of the evolution of CHD, from the development of coronary atherosclerosis, through triggering of acute cardiac events, to the experience of patients who survive a myocardial infarction. The article outlines the evidence for the importance of psychosocial factors in CHD, highlighting methodological issues in this field of research, and outlines implications for prevention and clinical management.

Coronary Heart Disease across the World

Coronary heart disease (CHD) is a leading cause of death and disability throughout the world. Statistics from the American Heart Association indicate that in 2010, CHD caused around one in six deaths in the USA, with more than 600 000 having a heart attack each year. Across Europe, CHD accounts for 20% of deaths among men and 22% among women, many of which occur in people less than 75 years old. Fortunately, there have been substantial reductions in deaths from CHD in recent decades. The death rates from CHD in the UK have declined by more than 70% since 1968, and over the last 15 years alone, CHD in high income Western countries has fallen by around a third. This pattern is due in roughly equal measure to two processes. First, changes in risk factors such as smoking and better treatment for high cholesterol and high blood pressure (hypertension) mean that fewer people are developing advanced CHD. Second, treatments of people with advanced disease or those who have suffered a heart attack (myocardial infarction) have improved, so survival is greater. One consequence is that there is a growing population of older people living with CHD. In the UK, there are thought to be over 1.6 million men and 1 million women with CHD, while estimates in the USA total more than 15 million. It should also be said that the increase in obesity and diabetes over recent decades may reverse the positive trends in risk factors.

The underlying cause of CHD is coronary atherosclerosis, a progressive condition involving the infiltration of cholesterol, inflammatory products, and smooth muscle cells into the walls of the coronary arteries, leading to the development of coronary plaque. This process starts early in life, but typically comes to clinical attention at advanced stages in the form of angina pectoris (chest pain on exertion), an acute myocardial infarction (MI), or sudden cardiac death (a death resulting from abrupt loss of heart function occurring within a short time of symptom onset). The long-term nature of CHD is important from the psychosocial perspective, since different factors may contribute to different stages.

There is no single cause of coronary atherosclerosis and CHD, so the focus is on risk factors that increase the likelihood of developing the condition. These can be divided into three categories: *nonmodifiable factors* such as age, gender, ethnicity, and heredity; *treatable conditions* such as hypertension, high cholesterol, and diabetes; and *modifiable risk factors*. The latter are primarily behavioral, and include smoking, physical inactivity, obesity, dietary choice, and excessive alcohol intake. Psychosocial factors fall into this third group, since they are potentially modifiable aspects of people's experience.

Psychosocial Factors

There is a tradition stretching back more than 100 years of speculation about the role of stress and personality in CHD. More recently, the concept of psychosocial factors has emerged to describe the range of psychological characteristics and social experiences that may be relevant to CHD. Table 1 summarizes the factors that have been investigated in most detail. They are divided into two categories: risk factors that increase the likelihood of developing CHD, and protective factors that may reduce risk. Within each category, there are three types of factors: first, exposures to various types of potentially stressful experience such as low socioeconomic status (SES), chronic work stress, and other types of life stress; second, experiences of the social environment that might be either negative (social isolation) or protective (social support); third, psychological characteristics and personality traits that may again be negative (e.g., depression) or positive (e.g., positive well-being). The evidence relating to these

Table 1 Psychosocial factors in coronary heart disease

Risk factors	*Protective factors*
• Low SES	• Social connectedness
• Work stress	• Social support
• Life events and chronic stress	• Positive well-being
• Social isolation	• Optimism
• Loneliness	
• Depression	
• Anger and hostility	

different aspects varies in strength and quality (Steptoe and Kivimaki, 2012, 2013).

Methods of Investigation

Several different methods have been used to investigate the role of psychosocial factors in CHD. First, animal studies can evaluate the impact of different social conditions on CHD in a highly controlled fashion, involving experimental designs that permit definite conclusions about causality to be drawn. For example, an influential set of studies of cynomolgus macaques by Kaplan and Manuck (1999) established the role of social stress in the development of CHD. Animal studies are also central to the investigation of behavioral and pharmacological interventions that may ameliorate the impact of psychosocial adversity. However, they do not in themselves prove that similar processes operate in humans, and the subtlety of human experience is difficult to capture in animal behavioral studies.

A second method of investigation is to carry out psychophysiological or mental stress testing with human participants. This technique involves monitoring biological processes while people are exposed to different conditions (*see* Cardiovascular Reactivity and Recovery). The method allows the impact of psychological and social stimuli on the biological processes involved in CHD to be examined under controlled conditions, and provides important mechanistic data about the biological pathways through which psychosocial factors increase cardiovascular risk. Patients and healthy controls or people at higher and lower risk can be compared, as can conditions relevant to stress processes such as controllability and social support.

The conditions in which psychophysiological stress testing is carried out are artificial, and the stimuli used (such as difficult cognitive tasks) are seldom encountered in real life. There has therefore been a growth in naturalistic or ambulatory monitoring in which biological processes relevant to CHD are measured in everyday life. Ambulatory blood pressure, heart rate, and heart rate variability are commonly monitored in these studies, as is salivary cortisol. The paradigm allows the impact of psychosocial stimuli on biology to be assessed in everyday conditions where ecological validity is high. Measures are limited to biomarkers that can be repeatedly assessed, and sophisticated statistical modeling is needed to take account of covariates such as time of day, smoking, concurrent physical activity, and other potential confounders.

These methods are primarily focused on mechanisms linking psychosocial factors with CHD, rather than the factors themselves. Cross-sectional comparisons between people with CHD and healthy controls are difficult to interpret since the presence of illness may change people's appraisals of their past experience. Longitudinal observational population studies are therefore needed. These studies have the following features: first, the recruitment of a large, preferably representative, population sample that is screened to ensure that participants do not already suffer from CHD; second, the measurement of exposure to the psychosocial factors being tested (e.g., chronic stress, low social support), along with other factors known to influence the outcome; third, the monitoring of the population over time, measuring the development of CHD and other health outcomes; finally, multivariate analysis to test whether exposure to the psychosocial factor is associated with CHD after the covariates have been controlled.

Such studies inevitably take many years to complete, and since assessments have to be made on hundreds or even thousands of participants, the detail in measures is often limited. Investigations of this kind are correlational rather than experimental, so cannot definitively establish causality; there may be unmeasured factors that influence both exposure to the psychosocial factor and outcome. In the absence of large trials where people are randomized to high and low risk conditions for many years, the longitudinal observational study provides the strongest data about the role of psychosocial factors. However, a true understanding of the role of psychosocial factors in CHD requires the convergence of evidence from all these methods of investigation.

Acute versus Chronic Psychosocial Factors

As noted earlier, different psychosocial factors may be relevant at different stages of CHD, as shown in Figure 1. The long-term progression of coronary atherosclerosis and development of CHD may involve exposure over many years to chronic psychosocial adversity (pathways 1 and 2). The longitudinal observational study is most appropriate here. On the other hand, triggering of acute cardiac events in people with advanced CHD may involve acute stressors (pathway 3), and require a different methodology. If people have survived a myocardial infarction or another acute

Figure 1 Psychosocial factors and the development of CHD. After Steptoe, A., Kivimaki, M., 2012. Stress and cardiovascular disease. Nature Reviews Cardiology 9, 360–370.

coronary event, they are at increased risk for future recurrent events. This provides a further stage for psychosocial factors, potentially affecting whether or not the person has another acute cardiac event (pathway 4). This article summarizes the impact of psychosocial factors at these three stages.

Chronic Psychosocial Adversity and CHD Risk

Chronic adversity takes many forms, as shown in **Table 1**. Perhaps the broadest concept relevant to CHD is SES defined by income, occupation, education, or wealth. There is a marked SES gradient in CHD in high income countries, with higher rates of CHD incidence and mortality in lower SES groups (*see* Socioeconomic Status and Health). The pattern is stronger in some countries than others, due in part to the social patterning of risk factors such as smoking and excessive alcohol consumption (Mackenbach et al., 2008).

Work Stress

The relationship between work stress and CHD has been studied extensively, and numerous large-scale prospective observational studies have been completed. The most common method of conceptualizing work stress is the 'job strain' or demand/control model, in which high work stress is thought to arise when high demands at work are coupled with low control over how the work is done, and how much flexibility the worker has. A recent *meta*-analysis of more than 15 prospective studies showed an age and sex-adjusted relative risk for job strain of 1.34 (95% confidence intervals (CI) 1.18–1.51); that is, people experiencing job strain have a 34% increase in risk of developing CHD than those without job strain (Steptoe and Kivimaki, 2013). Somewhat similar estimates emerge from studies of the second model of work stress used in this field, the effort/reward imbalance model in which stress is thought to arise from an imbalance between the amount of effort the person puts into the job compared with the rewards of work (in terms of salary, prestige, advancement, etc). Other aspects of work stress that appear to contribute to CHD risk include long working hours, perceived unfairness at work, and worry about whether future employment is secure.

There are several difficulties in interpreting this evidence. One important issue is the possibility of 'reverse causality': people with subclinical CHD might inflate their ratings of work stress or take on stressful work commitments, leading to an apparent prospective association between work stress and CHD. This issue can be addressed by removing from the analysis any new cases of CHD that occur within a few years of the measurement of work stress. For example, in one large European study the risk associated with job strain was the same after excluding CHD cases that arose in the first 5 years, arguing against reverse causation (Kivimaki et al., 2012). A second problem is confounding of the association between work stress and CHD by other factors that are linked both with stress and disease (such as low education). Although social epidemiologists take other factors into account in their statistical modeling, it is not possible to be completely confident that all possible confounders have been ruled out.

Other Forms of Chronic Stress

Other types of chronic stress have been studied less extensively in relation to CHD. However, a recent *meta*-analysis of prospective studies showed that self-reports of stress are associated with an increased risk of CHD, with a risk ratio of 1.27 (95% CI 1.12–1.45) (Richardson et al., 2012). Specific forms of life stress that have been linked with CHD include social isolation, loneliness, caring for a disabled or ill spouse at home, and death of a child (Steptoe and Kivimaki, 2013). Early life deprivation is also related to the development of CHD in middle age, though there is controversy about whether early life has a direct effect, or contributes through its relationship with adult social circumstances.

Emotional Responses

An important set of psychosocial influences on CHD are psychological characteristics, notably emotional distress and some personality features. Large-scale epidemiological studies have been used to study depression, with many studies showing that both clinical depression and lower levels of depressive symptoms predict future CHD in previously healthy populations (Nicholson et al., 2006). The relative risk after adjustment for controls was 1.90 (95% CI 1.49–2.42) in one *meta*-analysis, compared with no depression. Serious mental illness in general appears to be a risk factor, while raised levels of anxiety in the general population increase CHD risk as well (Roest et al., 2010). Another psychological feature that predicts future CHD is hostility and anger. A *meta*-analysis of 21 prospective studies indicated that hostility and anger were associated with a 19% increase in risk for future CHD events (Chida and Steptoe, 2009). Hostility was a core element of the concept of Type A behavior which became popular in the 1960s and 1970s. Although the Type A concept fell from favor because of failures to replicate earlier associations with CHD, some aspects of the syndrome still appear to be relevant. There is also intriguing evidence that basic personality constructs such as conscientiousness may be important, with greater longevity and reduced CHD risk in more conscientious individuals.

Protective Psychosocial Factors

The psychosocial factors described earlier increase risk of CHD. There is also a series of factors that may reduce risk (**Table 1**). Chief among these are positive social relationships, including social integration and social support. A *meta*-analysis in 2010 reviewed 148 studies, and showed an average 50% increase in likelihood of survival for people with stronger social relationships (Holt-Lunstad et al., 2010). Of course, social relationships can have negative effects as well, since interpersonal and family conflict are among the most prominent of chronic stressors in everyday life. But having supportive relationships and a social network that provides a sense of belonging and connectedness is health protective.

Another potentially protective factor that has been increasingly studied over recent years is positive well-being.

Positive well-being includes positive hedonic states (happiness, joy), sense of meaning and purpose in life, and positive evaluations of life (life satisfaction). Current evidence suggests that hedonic well-being and characteristics such as optimism may reduce risk of future CHD (Boehm and Kubzansky, 2012). Positive well-being is not merely the absence of emotional distress, but reflects positive states that rise above the neutral.

Mediating Mechanisms

Two broad sets of mechanisms likely mediate between these psychosocial factors and the long-term development of CHD. The first involves the physiological processes contributing to CHD development (**Figure 1**, pathway 2). Thus population-level studies of work stress are corroborated by mechanistic research on the biological processes relevant to CHD. For example, studies involving repeated measurements of blood pressure over the working day show that levels are slightly elevated in people reporting low control at work, and similar patterns have been reported for cortisol. Heart rate variability, an indicator of the balance between the sympathetic and parasympathetic branches of the autonomic nervous system, is reduced over the day in people experiencing work stress or social isolation, indicating a sympathetic nervous system dominance that may be cardiotoxic. Chronic work stress also predicts the development of the metabolic syndrome, a constellation of central obesity, high blood pressure and disturbances of metabolism that presages future CHD (Chandola et al., 2008). More broadly, stress induces increases in blood pressure, neuroendocrine responses, inflammation, and hemostatic (blood clotting) processes implicated in atherosclerosis. Heightened blood pressure responses to mental stress and impaired poststress recovery are characteristic of chronically stressed individuals, and predict future cardiovascular risk (Chida and Steptoe, 2010). Heightened cortisol responses to stress and altered cortisol profiles over the day are risk factors for the development of CHD. The protective psychosocial factors described in Section Protective Psychosocial Factors appear to have the reverse effect, reducing physiological stress responsivity in cardiovascular, neuroendocrine, and inflammatory pathways.

The second set of mechanisms relate to lifestyle (**Figure 1**, pathway 1). A study of more than 100 000 working people found that job strain is related to an increased likelihood of being physically inactive, smoking, and not drinking in moderation (Heikkila et al., 2013). The elevated risk of CHD in people with serious mental illness is mediated in part through its relationship with smoking and alcohol misuse. Psychological characteristics such as depression are associated with physical inactivity and smoking. It is likely that the protective effect of conscientiousness is because more conscientious individuals have healthier lifestyles, thereby reducing their risk (Bogg and Roberts, 2004). Social network studies have found that obesity, food choice, alcohol consumption, and other behaviors relevant to cardiovascular disease are transmitted through social networks, probably through a combination of shared environments, changing norms for behavior, and direct modeling of behavior.

Acute Psychosocial Triggers of Cardiac Events

Triggers are defined as activities or stimuli that exacerbate the acute physiological and pathophysiological processes that initiate cardiac events such as acute MI or sudden cardiac death (Nawrot et al., 2011; Steptoe and Brydon, 2009). They can include physical exertion, exposure to air pollution, and respiratory infection. An important feature of triggers is that they typically act in people who have advanced coronary atherosclerosis. Secondly, the psychosocial stimuli are not long-term stressors or social conditions, but short-term experiences. Triggers are not therefore involved in the development of CHD, but rather in causing clinical problems in people with preexisting disease.

The idea that psychological stress can trigger a heart attack has a long anecdotal history, but first came to wider attention following the study of people exposed to major earthquakes. Such individuals show an excess of cardiac deaths and hospital admissions for CHD over the days following these events. An increase in rates of clinical CHD has now been reported in response to other types of disaster such as major industrial accidents, wars, and terrorist attacks. The events need not be life-threatening either, since there is evidence that watching important sports matches is also associated with peaks in cardiovascular events. For example, an evaluation of cardiac emergencies in the Munich region of Germany during the 2006 World Cup identified peaks on days on which the German team played, particularly in the 2 h after the start of matches (Wilbert-Lampen et al., 2008).

It is not completely certain in these situations that the emotional stimulus caused the cardiac event. The circumstances of each case are difficult to reconstruct in the turmoil surrounding such situations, and factors such as physical exertion, heat, excessive alcohol consumption, or exposure to pollutants may contribute. It is also true that most acute cardiovascular events do not take place in response to major events affecting entire populations, but in individuals going about their everyday lives.

Studies of emotional triggers must overcome a number of methodological difficulties including survival effects (only people who do not die can report their experience), and the retrospective collection of information which may lead to failures of recall, and to biases in recall as the person searches for meaning in their experience (Steptoe and Kivimaki, 2012). New statistical techniques (such as case-crossover models) and systematic data collection methods have enabled more precise conclusions to be drawn. A *meta*-analysis of trigger studies showed that risk of acute coronary syndromes is increased around 2.5-fold when preceded by acute anger, stress, and depressed mood in the 2 h before onset of symptoms (Steptoe and Kivimaki, 2013). It is likely that very intense stress has stronger effects that last longer; one study found that the incidence of acute MI increased more than 20-fold in the 24 h following the death of a significant person, while a large study in Sweden found that the relative risk of death due to cardiovascular disease was 5.6-fold in people within 1 week of a diagnosis of cancer.

Two aspects of this evidence should be highlighted. First, the stimuli involved predominantly involve emotional stress, not the other types of psychosocial factor as listed in **Table 1**.

Second, although effects are striking, the majority of people do not experience heightened acute emotion in the hours before their cardiac event. For example, in the study showing associations with the death of a significant person, the number of patients exposed to such an event was very small. An analysis of the population attributable risk has estimated that emotional stress is involved in around 3.9% of acute cardiac events (Nawrot et al., 2011).

Physiological Mechanisms Underlying Triggering

Mechanistic studies have identified a number of psychophysiological processes that could underlie the triggering of acute cardiac events by emotional stimuli. One possibility is stress-induced transient myocardial ischemia (MISMI), a phenomenon discovered through detailed imaging of cardiac function during acute stress (Strike and Steptoe, 2003). It has been found that in a substantial proportion of people with advanced CHD, acute stress induces reversible reductions in blood flow through the coronary arteries (ischemia). These reductions in flow are due to constriction of the coronary arteries and may lead to abnormalities of the contraction of the heart that could potentially contribute to clinical coronary events. A second mechanism is cardiac arrhythmia which may again result in failures of effective contraction of the heart muscle (Ziegelstein, 2007). Additionally, heightened inflammatory responses to stress and alterations in hemostatic (clotting) processes may be involved. What this suggests is that coronary plaque rupture following periods of acute emotional stress may coincide with an inflammatory and prothrombotic milieu inside the coronary arteries that favors the development of coronary thrombus, leading to blockage of the vessels and severe tissue damage (Steptoe and Kivimaki, 2013).

Implications for Prevention

Knowledge about the role of psychosocial stimuli in acute triggering has not yet been translated into effective preventive or management strategies. In principle, it might be possible to identify individuals who are prone to responding to emotional stress with heightened physiological responses that put them at risk for acute cardiac events, but this is beyond current technology or resources. It is probably not feasible to ensure that patients with CHD are not exposed to natural disasters or to intensive emotions. However, increased awareness of triggers both among clinicians and the public would be helpful, as would increasing the availability and effective use of emergency equipment. It is also conceivable that cardiac patients who are particularly hostile or anger prone be provided with anger management training, thereby reducing the range of situations that are likely to elicit potentially damaging psychophysiological responses (Tofler and Muller, 2006).

Stress and Recovery Following Acute Cardiac Illness

The impact of psychosocial factors does not end when a person has an MI or is diagnosed with CHD. Survivors of MI are at increased risk for future fatal and nonfatal cardiac events, and the same psychosocial factors that are associated with the long-term development of coronary atherosclerosis also predict recurrent disease. Thus chronic life stress, continued job strain, social isolation, marital conflict, and financial strain following an MI have all been linked with increased risk of recurrent cardiac events (Arnold et al., 2012; Lett et al., 2007). But the factor that has been studied most intensively is depression. Severe depression is present in around 20% of patients after an MI, with a further 25% experiencing marked depressive symptoms (Thombs et al., 2006). Cardiac patients who are depressed are at increased risk for recurrent cardiac events and for death from CHD (Meijer et al., 2011). It might be thought that depressed mood is merely a marker of more severe coronary disease, but many studies have carefully evaluated the clinical cardiological condition of patients, and have found that even when this is taken into account there is still an increased risk to future health. This is a field of intensive research, with much interest in whether certain subtypes of depression are particularly cardiotoxic. The processes responsible for the links between depression and cardiac morbidity are likely to involve both behavioral pathways – such as poor adherence to medication, physical inactivity, and other activities that are prejudicial to health – and psychobiological pathways, including disturbances of autonomic nervous system activity, neuroendocrine responses, and vascular inflammation.

Implications for Patient Care

Research on psychosocial factors in CHD patients has stimulated major efforts to modify the link with recurrent cardiac disease. The two main targets of these efforts have been the treatment of depression and the management of stress. Large-scale studies focused on treating depression with pharmacological or cognitive–behavioral methods have had disappointing results with respect to cardiac outcomes, and this has prompted a re-evaluation of the most appropriate strategies both of identifying and managing patients (Thombs et al., 2013). More sophisticated approaches are now being tested, and may prove beneficial (Davidson et al., 2013). Stress management has also been used for a number of years with cardiac patients with mixed success (Linden et al., 2007); these methods are effective in reducing self-reported stress, but not necessarily with any impact on cardiovascular health. However, a new generation of studies appears to be having more positive effects on cardiac outcomes (Gulliksson et al., 2011).

Conclusions

Psychosocial processes are emerging as important factors in CHD, opening at several stages of the disease process. There are many methodological pitfalls in this field, and it is difficult to draw definitive conclusions about the causal role of psychosocial adversity in CHD. The development of effective interventions and management strategies will help establish the importance of psychosocial factors in clinical science.

Corporate Culture

Edgar H Schein, MIT Sloan School of Management, Cambridge, MA, USA

Abstract

Corporate culture is described and defined as an extension of the general concept of culture. Culture is both a state or property of a group and a perpetual process of reenactment among the members of the group. Corporate culture can be defined as the learned outcome of a group's solving its problems of external survival and internal integration. A model of culture is described and a number of approaches to describing the content of cultures are reviewed and illustrated. The degree to which corporate culture relates to economic performance is briefly reviewed and the concept of culture creation and change is discussed.

How to Think about and Define 'Culture'

To understand *corporate* culture one must first understand the concept of *culture*. A chronic issue in conceptualizing culture is whether to think of culture as a static *property* of a given organization – its shared customs, beliefs, norms, values, and tacit assumptions – or as a *dynamic human process* of constructing shared meaning (Frost et al., 1985). Culture *creation* is one of the unique characteristics of humans, being based on our capacity to be self-conscious and able to see ourselves and others from each others' points of view. It is this reflexive capacity of humans that makes culture possible. At the same time, it is the human need for finding meaning that creates the motivation for culture stabilization. Without some predictability, social intercourse becomes too anxiety provoking. Developing shared meanings of how to perceive, categorize, and think about what goes on around us is necessary to avoid the catastrophic anxiety that would result from reacting to everything as if it were a new phenomenon (Weick, 1995; Weick and Sutcliffe, 2007).

Given these human characteristics, it then becomes clear that culture is both a process and a state (Schein, 2010). In new situations, shared meanings must be constructed through a social learning process. As these meanings help the participants to make sense of their world they become stabilized and can be viewed as 'states.' At the same time, as the members of a group interact, they not only recreate and ratify prior meanings but also construct new meanings as new situations arise.

A useful way to think about this issue is to take a cue from the anthropologist Marshall Sahlins (1985) who argues that one cannot really understand certain social phenomena without understanding both the historical events and the cultural meanings attributed by the actors to those events. While it is undeniably true that we produce and reinforce culture through perpetual enactment and sense making, it is equally true that the actors in those same social events bring to them some prior meanings, stereotypes, and expectations that can only be understood in a historical context. Culture production in the enactment sense, then, is either the perpetuation of or a change of some prior state, but that prior state can be thought of as 'the culture' up to that point. One can then describe that culture as if it were a 'state' of the existing system, even though one knows that the system is dynamic and perpetually evolving. The direction of that evolution will be a product of several forces: (1) technological and physical changes in the external environment; (2) changes in the internal dynamics of the social system; and (3) historical circumstances that are fortuitous or serendipitous.

A good example is Sahlins' analysis of the death of Captain Cook at the hand of the Hawaiians. Because Captain Cook was viewed as a God (as predicted in the Hawaiian mythology), the sexual favors offered to his sailors by the Hawaiian women were viewed as gifts and as opportunities to relate to the divine. The sailors' cultural background defined this as a version of prostitution, however, for which they felt they should pay. When they offered the women something in exchange for the sex, the women asked for something that was scarce in the society, namely metal. Once the loose metal on board the ships had been used up, the sailors began to pull nails from the ship itself, weakening it structurally. Hence, when Captain Cook set sail he discovered that the ships needed repair and ordered a return to harbor. In Hawaiian mythology, a God returning under these circumstances had to be ritually killed. At the same time, Hawaiian social structure was undergoing change and became permanently altered because the subordinate role of women in the society was altered by their ability to acquire metal, a scarce resource that gave them social power.

Clearly, there was a culture in Hawaii and a different culture on board the British ship, and clearly the interaction of these two cultures produced events that changed both of these cultures. Culture in this sense evolves in all social systems that have any kind of stability of membership and a history of experiences. Thus, nations, religious groups, and occupational groups based on professional education and shared experience all have cultures and increasingly bring those cultures into organizations.

Implications for 'Organizational' Culture Analysis

The major lesson of Sahlins' analysis is that *when we have access to historical data we should use it*. Organizations have defined histories. Therefore, if we want to analyze organizational cultures, we should reconstruct their histories, find out about

the values of their founders and early leaders, look for the critical defining events in their evolution as organizations, and be confident that when we have done this we can indeed describe sets of shared assumptions that derive from common experiences of success and/or shared traumas. We can then legitimately think of these sets of assumptions as 'the corporate culture' at a given time. But the organization will also include subcultures based on occupational units or shared experiences. Some of these may be in conflict with each other and there may be subunits that have not yet had enough shared experience to have formed shared common assumptions (Martin, 2002).

We can also study the day-to-day interactions of the members of an organization with each other and with members of other organizations to determine how given cultural assumptions are reinforced and confirmed, or challenged and disconfirmed (Kunda, 2002). We can analyze the impact of these perceptual interactive events in order to understand how cultures evolve and change. This process could be especially productive in mergers, acquisitions, and joint ventures of various sorts. Whether one chooses to focus one's cultural research on building typologies of cultural 'states,' categories that freeze a given organization at a given point in time, or on analyzing the moment-to-moment interactions in which members of a given social system attempt to make sense of their experience and, in that process, reinforce and evolve cultural elements, becomes a matter of choice. Both are valid methodologies and in practice they should probably be combined.

A Formal Definition of Culture

Culture can now be defined as:

> "A pattern of shared basic assumptions that the group has learned as it solved its problems of external adaptation and internal integration, that has worked well enough to be considered valid and, therefore, to be taught to new members as the correct way to perceive, think, and feel in relation to those problems" (Schein, 2010).

Once these patterns have been learned, they function to reduce anxiety and provide moment-to-moment meaning and predictability to daily events. Or, as Trice and Beyer (1993) put it: "Human cultures emerge from people's struggles to manage uncertainties and create some degree of order in social life" (p. 1). Note that patterns of overt *behavior* are not part of the formal *definition* because such patterns can be elicited by other causes such as common instinctive patterns (e.g., ducking when we hear a loud noise) or by common reactions to a common stimulus (e.g., everyone running in the same direction to avoid some threat). If one understands the shared tacit assumptions, one can determine which regularities of behavior are 'cultural' and which ones are not. One cannot, however, infer the assumptions just by observing behavior.

Culture defined in this way can apply to an entire organization, group, or occupational unit provided there is a common history and member stability. If a group has no history or its members change all the time, it does not develop a culture.

The main problem in defining 'corporate culture' derives from the fact that any organization in today's multicultural world is a conglomerate of cultures and subcultures and is therefore also influenced by the deeper assumptions of nations, ethnic groups, and occupational units.

A Conceptual Model for Analyzing Culture

Whether one chooses to analyze culture as a state or as a process, it is helpful to differentiate the levels at which culture as a shared phenomenon manifests itself. Any group, organization, or larger social system can be analyzed in terms of (1) its visible and feelable 'artifacts,' (2) its espoused beliefs and values, and/or (3) its less visible, taken for granted shared tacit assumptions (see Figure 1).

This model is useful in two ways: (1) It helps a novice observer of organizational culture to differentiate the superficial manifestations and espoused values that most organizations display from the cultural substrate or essence, the tacit, shared assumptions that drive the day-to-day behavior that one observes; and (2) The differentiation of levels is a necessary conceptual tool in helping an organization to decipher its own corporate culture and subcultures.

To further understand these distinctions, especially the distinction between espoused values and shared tacit

Figure 1 The levels of culture.

assumptions, it is necessary to take a historical evolutionary point of view toward culture formation. If we take a typical business organization, the process starts with one or more entrepreneurs who found a company based on some *personal* beliefs and values. As they hire others to work with them, they will either choose those others on the basis of their compatibility or will socialize newcomers to the beliefs and values that they regard as core to running the new business. The founders' beliefs and values will cause the organization to make decisions in its environment and, if those decisions are successful, the newcomers will begin to entertain collectively the idea that the founder's beliefs and values must be 'correct.' If the environment continues to reinforce the behavior of the organization, what was originally the founder's *personal* beliefs and values gradually come to be *shared* and *imposed on new members* as the organization grows. If this success cycle continues, these shared beliefs and values gradually come to be taken for granted, drop out of awareness, and can, therefore, be thought of as 'taken for granted assumptions' that become increasingly nonnegotiable.

This process of culture formation will occur not only in reference to the organization's primary task in its various external environments but also with respect to its internal organization as well. Those founder beliefs and values, which provide meaning, make life livable and reduce interpersonal anxiety, will gradually come to be taken for granted and come to be tacit assumptions about the 'correct' way to organize. But in both domains, the driving force is what actually works. Culture is the *result* of successful action. If things do not work out, the group and, therefore, the culture as a culture will disappear but its assumptions may be carried on in individual survivors of the organization as was the case with Digital Equipment Corporation (Schein, 2003).

A basic need in human groups is to justify what they do. Paradoxically, the justifications often are not the same as the tacit assumptions that actually determine the behavioral regularities. Thus groups create ideologies, aspirations, visions, and various other kinds of 'espoused values,' which may or may not correspond isomorphically with the tacit assumptions. The most difficult aspect of deciphering organizational cultures, then, is to determine to what extent the claimed espoused values actually correspond to the behavioral regularities observed and, if not, to determine what the shared tacit assumptions are.

How to Describe Cultures

There are three approaches to describing cultures: (1) profiling them on various preselected dimensions; (2) creating conceptual typologies into which to fit given cultures; and/or (3) clinical or ethnographic descriptions that highlight unique aspects of a given culture.

Among the profiling approaches, one of the most widely used is Hofstede's four dimensions based on factor analyzing questionnaire responses: individualism (vs groupism), masculinity (the perceived gap between male and female roles), tolerance for ambiguity, and power distance (the perceived distance between the most and least powerful in the society). These dimensions were originally used to describe national cultures but have also been extended to descriptions of organizational cultures (Hofstede, 2001).

A different approach has been to use sociological dimensions developed by Parson (1951) and elaborated by Kluckhohn and Strodtbeck (1961) as a way of creating profiles of a given organization and identifying critical value issues – universalism vs particularism, individualism vs collectivism, affectively charged vs neutral, specific vs diffuse, time orientation, and degree of control over nature (Hampden-Turner and Trompenars, 1993; Trompenars and Hampden-Turner, 2011). A third version of this approach is to take one or two dimensions, consider them to be conceptually central, and create a typology based on a two-by-two table with those dimensions. Cameron and Quinn (2011) use flexibility vs stability and control and internal integration vs external differentiation to create four types of cultures: clan, adhocracy, hierarchy, and market. Goffee and Jones (1998) use the dimensions of degree of solidarity and degree of sociability to create four types: networked, communal, fragmented, and mercenary. Among the typologies we have Likert's Systems 1 to 4, Harrison and later Handy's 'Gods of Management,' McGregor's Theory X and Theory Y, Ouchi's Theory Z, and the more popular distinctions between 'command and control' vs 'committed and empowered' (Likert, 1967; Handy, 1978; McGregor, 1960; Ouchi, 1981).

The clinical or ethnographic approach attempts to deal with any given culture as a unique pattern of shared assumptions around issues that are not known before the clinician/researcher is on the scene as an observer and active inquirer (Schein, 1987). The prime objection to questionnaires as research tools for the study of *culture* is that they force us to cast the theoretical net too narrowly. The advantage of the ethnographic or clinical research method is that we can consciously train ourselves to minimize the impact of our own models and to maximize staying open to new experiences and concepts we may encounter. In the end, we may well sort those experiences into the existing categories we already hold. But at least we will have given ourselves the opportunity to discover new dimensions and, more importantly, will have a better sense of the relative salience and importance of certain dimensions within the culture we are studying. The issue of salience is very important because not all the elements of a culture are equally potent in the degree to which they determine behavior. The more open group–oriented inquiry not only reveals how the group views the elements of the culture, but, more importantly, also tells us immediately which things are more salient and, therefore, more important as determinants (Schein, 1996, 2003).

As to general dimensions that would be useful for studying any organization, I have found it empirically useful to start with a broad list of (1) 'survival functions' (what any group must do to survive in its various environments and fulfill its primary task) and (2) 'internal integration functions' (what any group must do to maintain itself as a functioning system). This distinction draws on a long tradition of empirical research in group dynamics that always turns up two critical factors in what groups do: (1) task functions and (2) group building and maintenance functions. Ancona (1988) pointed out that we must add a third set to these two, boundary maintenance functions. Task and boundary maintenance functions are

external survival issues, and group building and maintenance functions are internal integration issues. We may then construct different lists of what specific dimensions of behavior, attitude, and belief, we will look for in each domain but at least we have a model that forces us to cast the net widely, and a reminder that culture is for the group the learned solution to all of its external and internal problems.

To the extent that national and occupational cultures increasingly influence organizations one must also consider the influence of deeper assumptions about time and space, the human nature and human relationships, how the self is defined in relation to the collective, how the group views itself in relation to nature, and the nature of reality itself and how one arrives at truth (Schein, 2009, 2010).

Does Corporate Culture Matter?

Several claims based on various different kinds of research have tried to show a connection between the strength and/or type of culture and economic performance (Davis, 1984; Deal and Kennedy, 1982; Denison et al., 2012; Kotter and Heskett, 1992; Collins and Porras, 1994). The problem is that different kinds of cultural dimensions relate to different kinds of environments in ways that are not entirely predictable. The best way to summarize, then, is to say that culture certainly influences economic performance, but the manner in which this occurs remains highly variable. A culture that can be very functional in one environment or at one stage in a company's evolution can become dysfunctional and cause that same company to fail. Culture needs to be analyzed and understood but until much more research has been done, one cannot make generalizations about its impact.

Can Culture Be Created or Changed?

As indicated earlier, culture is created when a group is created by its founders. It then evolves as a function of actual experience. That evolution can be influenced by leaders setting new examples and mandating new kinds of behavior, but the culture will not change until the new behavior produces more desirable results and, thereby, comes to be accepted and eventually taken for granted. This is usually a slow process that can take many years (Schein, 2009, 2010).

In most mature organizations in today's more complex multinational world, one sees cultural evolution occurring in many different ways in the subunits of the organization. The question of 'culture change' then becomes the more difficult question of which elements of the culture are to be changed and, most importantly, why? When organizations face these questions it is best to focus on why the organization needs any change at all. Once a case is made for change in relation to organizational performance, one should then specify how that change would look behaviorally in the future, and only then consider how various elements of the culture or various subcultures would aid or hinder the proposed change (Schein, 2010).

Abstract

Corporate finance is concerned with financial decisions made by corporations. These decisions can be grouped easily into two major categories: investment decisions and financing decisions. Investment decisions and financing decisions must contribute together to create value for the company's shareholders. In order to make optimal financial decisions in keeping with the major objective of the firm (i.e., maximizing its shareholders' wealth), the financial manager adopts some analytical tools in the analysis, planning, and control activities of the firm. In fact, financial analysis is a necessary condition for making appropriate financial decisions. Accordingly, financial control can be defined as the whole of activities and tools that enable financial managers to carry out financial analyses for purposes of internal and external control. Since they need to keep under control both the profitability of capital invested and the cost of resources raised from investors, financial managers make use of an integrated system of analyses that includes financial statements, ratios, financial planning, investment valuation, and capital structure analysis. Each of these tools plays a key role with reference to the financial control activity, providing the financial manager with a wide range of information that helps the company's investment and financing decisions.

Corporate finance is concerned with financial decisions made by corporations. These decisions can be grouped easily into two major categories: investment decisions and financing decisions.

Regarding the first major decisions a firm must take, each company needs real assets (tangible and intangible) to carry on its business and keep its operations going. How much a firm should invest and what specific assets a firm should invest in are the typical questions related to investment decisions. Investment decisions, then, determine the total amount of assets held by a company and the composition of these assets. The economic evaluation of investment projects aims at orienting corporations' choices connected to their asset allocation process. This process that leads a company to allocate its capital to investment proposals whose benefits are to be realized in the future is generally referred to as *capital budgeting*.

All the assets we mentioned above are to be paid for. To raise the money necessary to their investments policy, corporations issue securities on financial markets. These financial assets have value since they represent claims on companies' real assets. Securities issued by corporations include not only shares of stock but also bonds, bank loans, lease obligations, and any other form of financing. How the cash required for investments should be obtained is the answer that financing decisions must give. Financing decision, in fact, are concerned with determining the best mix of financial sources in the form of equity and debts. In other words, financing decisions define the total amount and the composition of a company's capital structure. The definition of capital structure referred to is that which takes into account the explicitly costly forms of financing raised from the company's investors. For sake of simplicity, they are divided into financial debts and equity without dwelling on the different form of financing.

According to what has been highlighted about corporate finance decisions, financial management attempts to find specific answers to needs arising from both investment and financing areas.

After defining what corporate finance decisions are concerned with, the next step in this analysis will be to reread investment policies and capital structure decisions in the light of the theory of shareholders' value. Since the principle of maximizing shareholders' wealth largely is accepted as the rational guide for running a business and for the efficient allocation in an economy, it is assumed to be the objective in considering how financial decisions should be made.

Investment decisions and financing decisions must contribute together to create value for the company's shareholders. From one hand, a financial manager that acts in its shareholders' interest should invest in those projects that increase the overall firm's value and, then, its shares' value. From the other hand, the mix of financial resources that maximizes the company's value should be adopted. From this point of view, it becomes crucial to understand how corporate borrowing affects its shareholders' wealth according to Modigliani and Miller proposition II. In their article, Modigliani and Miller (1963) state that, in a world with taxes, the value of a levered firm increases in proportion to the debt–equity ratio (Debt/Equity). As we will show in Section Capital Structure Analysis this is due to the fact that financial charges are tax deductible whereas dividends and retained earnings are not; an increase in debts will reduce the company's cost of capital and raise the firms' value.

In addition to that, it must be kept in mind that investment decisions and financing decisions interact, sometimes producing different consequences on the company's value. In fact, any change in the firm's capital structure influences the cost of capital that a company applies to discount investments cash flows. Consequently, any rise in the cost of capital could make any investment less profitable, reducing its contribution to the overall company's value.

From what has been said, it can be concluded that both investment and financial decisions have to be analyzed in relation to their impact on the firm's major objective: to make the firm's shareholders as well off as possible. As a result, an

optimal combination of the two areas of decision will maximize the value of the firm for its shareholders.

Consistent with that, the financial manager must act as an intermediary between the firm's operations and capital markets where the firm's securities are traded. The purpose of capital markets is allocating savings efficiently in an economy, from ultimate savers to ultimate users of funds who invest in real assets (companies). In fact, companies issue securities and raise cash by selling those financial assets to investors. Then the cash is invested in the firm's operations and used to purchase real assets. Later, if the firm does well, the real assets generate cash inflows that more than repay the initial investment. Finally, once the firm's operations generate new cash, this is either reinvested in the company or returned to investors who hold the securities originally issued. The last decision is not completely free for the financial manager, but it depends on several factors such as the characteristics of the specific financing, the dividend policy, the financial needs of the company.

Corporate Finance Decisions and Financial Control

In order to make optimal financial decisions in keeping with the major objective of the firm (i.e., maximizing its shareholders' wealth), the financial manager must implement inside the firm an effective process of analysis, planning, and control and make use of some analytical tools. In fact, financial analyses are a necessary condition for making appropriate financial decisions in the meaning as stated before. From a very simplistic point of view, in order to create value for all the company's investors (debtholders and stakeholders), the asset allocation process must yield more than the company's cost of capital.

Since the financial manager has to grant that the cash flow ability of the firm will properly remunerate its financial sources over the long run, they must evaluate the size and timing of cash flows and monitor the company's capital structure, its major sources and uses of funds, and its profitability over time. As a measure of the company's profitability ROI (return on investments = operating income/capital invested) is taken into consideration. According to that, the financial manager is concerned on one hand with the profitability of the company's investments and with the efficiency of the implemented asset management decisions. It means that they have to make use of rational tools to evaluate capital budgeting decisions. On the other hand, the financial manager is interested in keeping constantly under control the changes in the company's capital structure that can affect both the firm's cost of capital and the yield required by capital suppliers. If the company's cost of capital is defined as the weighted average cost of capital (WACC) and represents the net cost of debts and equity weighted by their percentage on the total capital structure, an increase in the percentage of debts, for instance, can reduce the WACC since they are less costly than equity, due to their fiscal deductibility; at the same time, an excessive rise in debts can make the company be perceived as a riskier investment and thus induce investors to require higher yields on debt and equity. Both these effects have to be taken into account once the financial manager is approaching any financing decision.

In the light of what financial managers must do to maximize shareholders' value, *financial control* can be defined as the whole of the activities and tools that enable financial managers to carry out financial analyses for the purposes of internal and external control. By internal control, we mean evaluating the investments profitability and the efficiency/effectiveness of the capital budgeting process. In addition to that, a form of internal control is considered as any analysis turned to keep under observation the composition of the company's capital structure. External control is any aspect of financial analysis that outside suppliers of capital take into consideration in evaluating the firm and that the financial manager should be interested in the endeavor of bargaining more effectively for outside funds.

So far it has been stated that the main corporate goal is to increase the shareholders' wealth. According to that, a company creates value if its shareholders' wealth rises. It is worth mentioning that, recently, financial markets and investors have taken into account new parameters in the evaluation of financial investments. These parameters add a social and ethical appraisal of financial investments to a pure financial valuation. Such parameters aim at reminding companies of their social responsibilities and spur them to give constructive contributions to society and bring positive energy to the solutions of its problems.

As a consequence of the new approach to interpreting the corporate role within the society, investors choose to invest their money only in those companies that behave ethically. On the other hand, financial products suppliers are tailoring new financial products which are labeled as ethical, and that respond to the new evaluation requirements.

The Dow Jones Sustainability Index (DJSGI) can be seen as an example of this new trend inside financial markets. That index, in fact, consists of more than 200 companies that represent the top 10% of leading sustainability companies in 64 industry groups in the 33 countries covered by the DJSGI.

The companies included in the DJSGI have shown over time a strong commitment on the achievement of the five corporate sustainability performance principles: innovation, high standard corporate governance, shareholders' requirements, best practices, and social behaviors.

From what has just been highlighted, managers must be aware that new principles beyond those suggested by financial theories have to be pursued in running their business.

An Integrated System of Financial Analyses

An effective financial analysis, planning, and control process is critical to enhance enterprise value and, then, shareholders' wealth. To make rational decisions in the shareholders' interest, financial managers need to be supported by an integrated system of financial analyses and reports. These tools enable financial managers constantly to control both the profitability of the company (in the meaning of the firm's ability to generate cash flows from its operating activities) and the cost of resources applied to undertake operating investments that determine the company's cost of capital.

Since they need to keep under control both the profitability of capital invested and the cost of resources raised from

investors, financial managers make use of an integrated system of analyses that includes financial statements, ratios, financial planning, investment valuation, and capital structure analysis. Each of these tools plays a key role with reference to the financial control activity, providing the financial manager with a wide range of information that helps in orienting the company's investment and financing decisions. Even if financial analysis, planning, and control activities are often considered as different tools, they have to be viewed as a whole since they together aim at accomplishing the maximization of shareholders' value.

In large companies it often happens that different managers carry out the above mentioned analyses in different departments. It becomes important, then, to construct an integrated system of data exchange that allows the different tools to work jointly. To assess an investment's profitability, for instance, it is necessary to forecast the company's market share in order to determine its potential incremental revenues and cash flows. In addition to that, the composition of the expected capital structure will be also needed to calculate the new cost of capital and discount future cash flows at that rate.

Financial Accounting

Financial accounting (financial statements, ratios, and cash flow statements) gives the financial manager a picture of the firm's past performance and its current standing. These analyses help the financial manager to understand the company's current economic and financial situation and make forecasts for the future. It also allows the manager to represent the firm's position according to its competitors and its evolution over time.

The reorganization of financial statements (assets and liabilities statement and income statement) according to some predefined schemes is the first step of a process that, starting from accounting information, ends up with the appraisal of a company's performance from both income and cash flow perspective.

One of the criteria applied to reorganize the company's financial statements is, for instance, the activity-related method. With relation to this approach, we group the balance sheet entries in current and noncurrent assets and liabilities according to their pertinence or otherwise to the operating cycle of the company. The same criterion applied to the items contained in the income statement allows us to separate revenues and costs in relation with the four activity areas that can be identified in an ongoing business: current, financial, subsidiary, and extraordinary activities.

Once financial statements have been reorganized, it is possible for the financial manager to combine income statement and balance sheet entries in order to obtain significative ratios. Second, from reorganized financial statements, a cash flow statement can be drawn up as well.

In particular, a complete system of ratios describes the current state of health of the company according to different points of view: liquidity, profitability, leverage. This analysis offers a static diagnosis of the firm that can be helpful for-managerial control and for a better understanding of what outside suppliers of capital may expect in terms of a company's financial condition and performance. In fact, both the financial manager and the company's investors are interested in measuring the return on investments of the company, its capability of repaying debts in the short run and in the long run, and the relation between debt and equity. Consistent to that aim, ratios are mostly employed for *ex-post* analysis, to verify the effect of investment and financing decisions on the company's profitability, and for the composition of its assets and liabilities.

The final step in the above mentioned process of financial analysis is represented by the construction of the cash flow statement. Cash flow analysis can be seen as a dynamic analysis that highlights the company's ability of generating cash flow. Using cash flow, the financial manager identifies the sources and uses of monetary resources during a given period. The cash flow statement groups all the inflows and outflows according to their pertinence to the current activity, the financing and reimbursement activity, the investment activity (operating and nonoperating), and to the remuneration of debt holders and stakeholders. In other words, this tool leads to the quantification of the cash inflows that the company is currently able to generate from its operating activity, and the comparison of them to the flows absorbed by the investment policy, the debt repayment, and the dividend policy. In fact, it is one thing if a company can provide the monetary resources autonomously to undertake investments and adequately remunerate the capital invested, while it is quite another if the same company regularly needs to find outside sources of capital in order to avoid financial distress caused by an insufficient production of cash inflow.

Consistent with that, the cash flow analysis can be interpreted as an *ex-post* analysis that helps the financial manager to appraise the impact of investment and financing decisions in terms of financial flows.

Financial Planning

Financial planning enables financial managers to assess the effects of financing and investment decisions *ex-ante*. Financial planning is a necessary analysis as investment and financing decisions interact and they should not be made independently. Financial planning is concerned with analyzing financial flows of the firm as a whole, forecasting the consequences of investment and financing decisions, and weighing the effects of different alternatives. In fact, any financial decision that affects the investment policy of the firm or its mix of financial sources raised from investors influences the company's future profitability as well as its capital structure (and its cost of capital). The financial manager has to define both a target financing mix and a target return on investments and undertake only the investments/financings consistent with those targets. In order to keep under control any unexpected change that can modify the company's return on investments or its cost of capital, the financial manager has to analyze any financial strategy very carefully and to take into consideration any economic and financial impact that it may have. Moreover, financial planning makes possible the comparison of different investment and financing strategies in order to evaluate which one maximizes shareholders' wealth.

The tangible tool applied in the planning process is the financial plan describing the firm's financial strategy and projecting its future consequences in a proforma balance sheet, income statement, and cash flow statement. In particular, the forecasted cash flow statement provides an effective method for the financial manager to assess the growth of the company and its resulting financial needs as well as to determine the best alternative to finance those needs.

In fact, the plan sets financial goals and it represents a benchmark itself for evaluating subsequent performance. Helping the company to achieve these goals is one of the chief responsibilities of financial planning.

Finally, the planning horizon depends on the company and its business. High-tech companies, for instance, produce much shorter financial plans than most companies do as a consequence of technologies life cycle, whereas public utilities and energy companies make longer financial plans due to the long lead time of their capital projects.

Investments Valuation

Capital budgeting involves the entire process of planning capital expenditures whose returns are normally expected to extend beyond 1 year. Since we stated that investment decisions must be made so that they maximize shareholders' value, capital budgeting decisions forcedly must be related to the firm's overall strategic planning. Capital budgeting must be integrated with strategic planning as excessive investments or inadequate investments could cause serious consequences for the future of the firm. If the company invested too much in fixed assets overestimating its potential growth, it would incur unnecessarily heavy expenses that would reduce its return on investments. On the other hand, if a company has not invested enough in new production capacity it may lose a portion of its customers to rival firms. A related problem is how to properly phase the availability of capital assets in order to have them 'working' at the correct time. An effective process of capital budgeting aims at improving the timing of asset acquisitions and the quality of assets purchased. Another reason that highlights the relevance of the capital budgeting process is that asset expansion typically involves substantial expenditures. Before a company undertakes an expensive investment such as the purchase of a new plant, the launch of a new product, or the signature of a commercial agreement, it needs to plan how to raise funds required for that specific project. A number of factors make capital budgeting one of the major financial management decisions. In fact, not only does any investment decision contribute to determine the company's profitability (and its ROI) and, then, the shareholders' value, but also the capital budgeting process vitally affects all departments of a firm (such as production, marketing, finance, to mention a few). Since financial managers need to keep under control the asset allocation process so as to grant the maximum value to their shareholders, it can be said confidently that one of the most important corporate finance functions is the economic valuation of investment projects. In fact, the first step in undertaking any allocation project is the analysis of its economic and financial profile. The latter aspect is taken into account in drawing up the financial plan, where the financial manager verifies the compatibility of the cash flows related to the project under consideration with those that happen at the overall company's level.

The financial manager must carry out those projects that maximize the incremental value for the company's shareholders. In order to increase shareholders' wealth, a project must yield more than the cost of funds used to undertake the capital expenditure. It is, then, possible to conclude that the financial manager must judge a certain investment project according to its expected return. If this is higher than the company's cost of capital, the specific investment will create value for the company's shareholders.

As the asset allocation process is led on a continual basis, the financial manager must measure constantly the profitability of the firm's investment activity. Such a form of control makes use of appropriate methods of analysis like the NPV and the IRR. The NPV (net present value) is the present value of the cash lows stemming from the investment project; the IRR (internal rate of return) is that rate that makes the NPV equal to zero and it can be seen as the gross return of an investment project.

The implementation of the above mentioned tools of financial control on investments prevents the funds being misallocated. In fact, when many alternatives of investment are evaluated, the most profitable will be chosen first, then the others one by one according to their expected rate of return. This *modus operandi* becomes a necessary approach if the company has a limited amount of funds available to finance investment projects (*capital rationing*).

Capital Structure Analysis

Capital structure refers to how the firm's assets are financed. If the monetary resources that the current activity is able to produce are not enough to offset the cash-outs due to the company's investment activity, the firm needs to raise new funds from investors. Accordingly, capital structure is concerned with explicitly costly forms of financing just as financial debts (bonds, loans, overdrafts) and equity are. In fact, both debt holders and shareholders want to be remunerated for the money they invested into the company. It is then possible to determine the cost of capital as the average of the net cost of debt and equity (WACC). To calculate the average, the impact of debts and equity on the total capital structure has to be taken into account.

The composition of capital structure influences the company's cost of capital from two different points of view. First, any change in the amount of debts and equity will make their weights vary so that we come up with a new WACC, other things being equal. Second, the cost of capital will differently change according to which form of financing is chosen. Since financial charges are tax deductible whereas dividends and retained earnings are not, an increase in debts will reduce the WACC. However, it must not be concluded that a company should be 100% debt financed. In fact, the more debts rise the higher the risk of financial distress will be. This higher risk perceived by investors leads debt holders and stakeholder to ask for being granted a higher rate of return.

The composition of capital structure impacts on the shareholders' value since it influences the cost of capital invested in

the company. If the return on investments remains equal, a rise in the cost of capital will cause a decrease in the company's profitability and in shareholders' wealth. The financial manager has to take into consideration the effect on the capital structure when any financing decision is evaluated. Once a financial need arises from the planning activity, the financial manager should simulate what impact a debt or equity issue may have on the overall company. This activity enables the financial manager to quantify the effects of financing alternatives in terms of the firm's cost of capital and financial riskiness.

We are assuming that there are no capital constraints that affect the company so that the firm can count on an unlimited access to both the equity market and the debt market. According to this hypothesis, the financial manager can choose the financing alternative that maximizes the shareholders' value and minimizes the cost of capital. Sometimes, however, the firm has to face with a limited availability of financing alternatives to raise money from investors. In fact, many factors such as capital markets features or aspects related to companies' ownership and control could make some financing decisions unfeasible. At the same time, other aspects such as corporate taxation can make some sources of financing preferable in comparison to others.

Abstract

'Corporate governance' rules define decisionmaking roles among various corporate stakeholder groups. There is disagreement as to the goals of corporate governance, with some advocating an exclusive focus on shareholder value while others advocate including the interests of other stakeholders such as creditors and employees. Major means used to advance the interests of shareholders and/or other stakeholders include the board of directors, shareholder voting, monitoring by various gatekeepers, fiduciary duty rules, and incentives created by various markets.

'Corporate governance' refers to the legal rules and institutional framework that structure decisionmaking within business corporations. Major groups, which may play roles within corporate governance include directors, officers, shareholders, creditors, and employees. Several bodies of law are implicated in corporate governance, above all corporate or company law, but also securities law as well as elements of tax, antitrust, contract, commercial, employment, and bankruptcy law. Several types of markets are also implicated, above all stock markets, but also other financial markets, managerial labor markets, and general labor markets.

Following a brief outline of the basic governance problem, this analysis of corporate governance begins by considering the various goals corporate governance may serve, seen through the light of a series of conflicts in the interests of different groups. It proceeds to consider the means of corporate governance, that is, various legal and nonlegal mechanisms, which help structure how decisions within corporations are made within the context of these competing interests. Corporate governance frameworks have not only major similarities across countries, but also significant differences. After considering these similarities and differences and a variety of recent developments, the analysis concludes with an overview of a longstanding debate over the extent to which different national frameworks are and should be converging over time.

The Governance Problem

In all but the simplest of businesses, the actions of a variety of types of persons must be coordinated: equity investors, employees, managers, creditors, suppliers, and customers, to name some of the most important. These persons could all coordinate their actions through simple spot markets, with constantly shifting prices for their products and services. However, in many cases people have found it useful to form a firm in which their actions are coordinated through the directions of managers (Coase, 1937).

The corporation has been the leading legal form used by business firms. It is not the only such form – partnerships also have a long history, and more recently a number of new legal forms have been developed, most importantly the limited liability company (Ribstein, 2009). Here, though, the focus is only on corporations. The equity investors in a corporation are called shareholders or stockholders. A corporation may have just one shareholder, or a small number of shareholders with no active market for their shares, or thousands of shareholders whose shares may be readily traded upon a public stock market. The practical governance problems a corporation is likely to face vary greatly with their ownership structure. In the late nineteenth century there began to emerge a type of corporation in which there were many shareholders who owned only a small fraction of the total shares, and no one person or group owned a controlling block of shares. In a seminal work, Berle and Means (1932) identified such corporations as creating a separation of ownership and control, and the problem of that separation has dominated American corporate governance ever since. However, such corporations remain rare in most countries, where the role of controlling shareholders is critical.

Corporate (or company) law provides the central legal framework for corporations. Most legal authority for running a corporation is vested in the board of directors. However, the board may, and in larger corporations almost certainly will, delegate that authority to a series of officers. Between them, the directors and officers are charged with management of a corporation. In doing their jobs, they must supervise the work done by the corporation's employees. They must also raise money through the issuance of shares or through various forms of debt, and then must manage relationships with the resulting shareholders and creditors. They must obtain needed goods and services from outside suppliers, and must find and satisfy customers who buy the goods or services, which the corporation produces. Thus, the actions of many different types of persons must be coordinated, and the interests of those different persons will often differ. The corporate governance framework provides both legal and nonlegal mechanisms by which these different groups are coordinated and their conflicts of interest managed. The traditional literature in corporate law and economics, following Berle and Means (1932), has conceived of this as an agency cost problem in which the temptation of managers to make decisions that benefit

themselves rather than the corporation must be constrained (Jensen and Meckling, 1976).

Goals

In whose interests is and should a corporation be run? Given the many decisions that must be made within a corporation, and the many groups involved, that question could have quite a complex set of answers. A long-running debate tends to oversimplify the question into two alternatives: shareholders or stakeholders. That is, either corporations should be run to maximize the return to its shareholders, or else it should balance the interest of a variety of the groups mentioned above. The shareholder primacy view has come to dominate in the United States and to some extent other English-speaking, common law countries, while the stakeholder view dominates elsewhere. However, a more fine-grained understanding of the conflicting possible goals underlying corporate governance flows from considering a number of significant potential conflicts between the interests of various groups involved in corporations (Kraakman et al., 2009).

Shareholders vs Managers

Shareholders elect the board of directors, but then have little other formal authority in running a corporation, although shareholders do vote on a few major decisions such as amendments to the corporate charter, mergers, and dissolution. The board may in turn delegate much of its authority to various officers. By managers, I refer to both directors and officers. As noted in the discussion of Berle and Means above, where there are many dispersed shareholders, it will often be the case that no one shareholder has the incentive and the means to monitor the behavior of the managers. The managers may then be able to make decisions that benefit themselves at the expense of shareholders generally. This is the problem of the separation of ownership and control that is the central concern of American law for public corporations.

Controlling Shareholders vs Minority Shareholders

In corporations where one shareholder or a small group of shareholders owns enough shares that it can effectively choose on its own who will be on the board, the controlling shareholder has effective control over the corporation through its domination of the board. Moreover, if the control block is large enough, even on those matters in which shareholders do have a vote, the controlling shareholder may control enough shares to gain approval of measures without the support of other shareholders. In such corporations, the controlling shareholder may have the means and the incentive to dictate decisions that benefit it at the expense of other shareholders. In most countries, this is the dominant problem of corporate law, as in most countries almost all corporations have a controlling shareholder. Even in the United States, this conflict plays a major role in some parts of corporate law, most notably the law governing squeezeouts of minority shareholders.

Note that for most companies, one or the other of these first two conflicts will be a major concern, but not both. If there is no controlling shareholder, then this second conflict is not a problem. If there is a controlling shareholder, then in most instances that shareholder will have both the incentive and the means to monitor managers enough to significantly reduce the conflict between shareholders and managers. That conflict will not disappear – monitoring is costly and hence imperfect – but in such corporations the conflict is likely to be limited and manageable enough that it will not be a major focus of legal concern. In some unfortunate types of companies, though, both conflicts may be simultaneously severe. An important instance may be many state-owned enterprises (SOEs) in China (Yang et al., 2011). Most SOEs today have minority shareholders, but the dominance of a branch of the government makes those shareholders highly vulnerable to actions against their interest. And yet, agency problems such as corruption within the state itself will often leave the managers of SOE with much leeway to pursue their personal interests.

Shareholders vs Creditors

The legal recognition of limited liability for the shareholders of corporations creates a conflict of interest between shareholders and creditors. If a corporation does not fare well and does not have enough income or assets to repay its debts, in general its shareholders will not be held personally liable for those debts. This gives shareholders an incentive to induce the corporation to take on too much risk. Should highly risky actions lead to high profits, the shareholders, as residual claimants, are the main beneficiaries, while should those risky actions cause the corporation to go bankrupt, shareholders' losses are limited and much of the burden is borne by creditors. Creditors, in contrast, want the corporation to take on quite small degrees of risk – they care only that the business earn enough to pay them off, amounts earned beyond that do not benefit them.

Many mechanisms exist to address this conflict. Many of these are nonlegal self-help by creditors, such as loan covenants, monitoring before extending credit, staged credit, higher interest rates to compensate for credit risk, and so on. There are also many legal rules that exist to help protect creditors. Some of these are part of corporate law, including legal capital rules and the doctrine of piercing the corporate veil. Others are part of other areas of the law, including much of bankruptcy law, the law of secured transactions, and fraudulent conveyance statutes.

Shareholders vs Employees

Employees are the persons who do most of the actual work to carry out the actions of a corporation. Insofar as they are supposed to be advancing the ends of shareholders or of the other constituents, there is thus a classic agency problem, as employees may be able to act in ways that benefit themselves but not shareholders or the corporation. The risk of opportunism runs both ways, though. Especially insofar as employees have acquired firm-specific human capital, they will be interested in the long-run success of the business, as their alternative sources of employment will often be less attractive. Risks that look worthwhile to diversified shareholders with

limited liability may look much less so to employees whose livelihood is closely tied to the continuation of a particular business.

As noted above, American corporate law does little to either constrain or protect employees, outside of basic agency law. Other areas of law, especially labor, employment, and contract law, serve those purposes. However, employees are a significant part of corporate law in some countries, most notably Germany.

Other Stakeholders

The above four sets of conflicting interests set forth the constituency groups that play the biggest role in corporate governance. Yet, other groups may in some circumstances be relevant as well. A majority of states have enacted corporate constituency statutes, which allow boards to take into account the interests of groups other than just shareholders. In addition to creditors and employees as mentioned above, the other groups most frequently cited in constituency statutes include suppliers, customers, and the communities in which corporations are located.

Note that noncorporate business forms, particularly various forms of cooperatives, may make some constituency group other than shareholders, in effect the owners of the business. Constituent groups so empowered in cooperatives may include employees, suppliers, and customers.

Means

The previous section set out the main groups whose interests may be protected or balanced as a part of the system of corporate governance. This section considers major legal and nonlegal mechanisms by which those interests are protected or balanced.

The Board of Directors

The board of directors is the core locus of authority within corporations as a matter of law. Some justify this as the best way of protecting the interests of shareholders, who elect the board (Bainbridge, 2003), while others justify it as a way of balancing the interests of various constituencies (Blair and Stout, 1999). In practice, the traditional role of boards in public corporations was to provide strategic guidance and advice. In recent decades, there has been an increased focus on boards as monitors of the behavior of officers.

Along with the contemporary focus on the monitoring role of boards, have come the new best practices and then legal requirements that a majority of directors be independent of the corporation, aside from their role as directors. Exchange and securities rules specify who counts as independent, and also require committee to carry out various functions, including audit, compensation, and nomination committees. Controversy surrounds this move to a focus on monitoring and independence, with some arguing that boards have largely shown themselves unable to deliver on these new expectations (Fairfax, 2010).

Voting

The power of shareholders to direct corporate affairs through voting is limited. Shareholders elect directors (exclusively, outside of the codetermination context), and as noted above they vote on certain fundamental matters. But at least in the United States, shareholders vote on matters such as charter amendments, mergers, and dissolution only after the board has first voted in favor of a proposal. Thus, shareholders cannot initiate changes (although shareholders can act on some of these items in some countries without board approval). Moreover, traditionally the power to elect directors has been of limited use in public corporations, since most shareholders do not attend shareholder meetings but instead vote by proxy, and generally only the corporation itself finds it financially worthwhile to distribute proxy material. Thus, shareholders have traditionally only been able to vote on the slate presented to them by the board. The main context in which the shareholder's power to vote for the board has had value (in public corporations) is when there is a hostile takeover, so that bidders can acquire a controlling share and thereby take control. However, boards have been able to find highly effective defenses against takeovers, and for the most part American law has allowed those defenses (British rules have been less accommodating of takeover defenses).

More recently, certain institutional shareholders with an interest in active corporate governance have attempted to expand their ability to influence corporate behavior through voting. Their efforts are discussed below in the Recent Developments section.

Fiduciary Duty, Antifraud Rules, and Shareholder Suits

Shareholder suits against directors, and more rarely officers, are one of the major legal tools used to prevent and discipline misbehavior. Such suits are brought under both state and federal law. State law suits are brought to enforce the fiduciary duties that corporate law imposes upon officers and directors. Traditionally there were two main duties, the duty of loyalty and the duty of care. The duty of loyalty forbids managers from taking actions in which their personal interests differ from those of the corporation. The duty of care requires managers to gather adequate information before making decisions. The business judgment rule protects managers in care suits and makes liability extremely unlikely for such cases (Black et al., 2006).

In recent decades, state fiduciary duty cases have expanded beyond these traditional categories. Specialized standards of review have been developed where boards adopt antitakeover defenses, where they sell control of the corporation, and where they take action to limit the shareholder franchise. Delaware courts have also expounded upon the requirement to act in good faith as a way to review types of behavior that fall in between the categories of care and loyalty, notably including the decisions of boards to establish monitoring systems and the setting of executive compensation (Hill and McDonnell, 2012). Good faith is discussed further in the Recent Developments section below.

Federal law shareholder suits are brought under various antifraud rules of securities law, most commonly Rule 10b-5.

Federal courts made such suits easier to bring in the 1960s and early 1970s, but then started cutting back on this trend through a variety of opinions. Congress further tightened liability standards with the Private Securities Litigation Reform Act of 1995. However, shareholder litigation under both state and federal law still remains robust (Thomas and Thompson, 2012).

Gatekeepers

A variety of professionals function as corporate 'gatekeepers.' Gatekeepers monitor and collect information about a corporation and certify that information to investors and other outsiders. As such, they help reduce the problems of asymmetric information, which lie at the heart of the agency problems that are at the heart of the corporate governance problem (Coffee, 2006). Significant gatekeepers include auditors and accountants, lawyers, credit rating agencies, directors and officers' insurers, research analysts, and investment banks.

A variety of legal and nonlegal mechanisms work to give gatekeepers incentives to diligently gather and honestly disseminate information, although those mechanisms do not work perfectly. A leading nonlegal mechanism is reputation: being associated with a particular gatekeeper is more valuable if that gatekeeper has a good reputation for providing accurate information. Such a reputation allows gatekeepers to charge higher fees, thereby giving them incentive to continue to be honest and diligent. However, both internal agency costs within gatekeepers and potential one-time big payouts from dishonesty may undermine reputational incentives. Reputation and other nonlegal mechanisms are supplemented by various legal rules, which impose regulations on gatekeepers. These legal rules have evolved significantly in recent years, as discussed below in the Recent Developments section.

Markets

A variety of markets help shape patterns of corporate governance. Most crucial are stock markets. A classic element of corporate governance is 'the Wall Street Rule.' If shareholders are unhappy with the performance of a company with an active market for its shares, they can always sell their shares. This Wall Street Rule undermines some other governance mechanisms, notably shareholder voting – shareholders have less reason to engage in costly voting and monitoring if they can simply sell their shares when unhappy. However, the Wall Street Rule itself helps to discipline managers. If shareholder's selling leads to a lower stock price, a corporation will find it more costly to raise funds through new issuances. Perhaps more significantly, lowered share prices hurt managers personally insofar as a large part of their compensation is received through shares and options, as is true for most corporations today. A low share price also makes a corporation more vulnerable to a hostile takeover.

Other markets also help discipline managers. Bond markets are a more important source of funding than stocks for public corporations, so that variations in the price of a corporation's bonds can crucially affect its costs of capital. Various contractual and market features in credit markets help discipline managers (Whitehead, 2012). The managerial labor market also affects corporate governance: for managers who seek more prestigious and higher paying future jobs, earning a good reputation is important. Labor markets for lower level employees also play a role: a corporation with a reputation as a good employer will be able to attract new employees at lower wages. Product markets also play a role: a well-run company will be able to offer quality good or services at lower prices, and as a result improve its profitability, while poorly run companies ultimately face the threat of bankruptcy as customers move to competitors.

A key underlying element in debates over corporate governance concerns how well these various markets tend to function as disciplinary devices for corporate management. Those who argue for relatively light legal regulation of corporate governance believe these markets do a good job, and hence regulation should be enabling and limited (Easterbrook and Fischel, 1991; Romano, 1993). Those who believe in more extensive and mandatory governance regulation see greater imperfections in these markets, although they do not deny the value of them as elements of corporate governance (Bebchuk, 1989).

International Differences

Corporate governance structures and practices as well as laws differ systematically between countries. A major factor driving these differences is variations in typical shareholding patterns, although these differences in shareholding patterns in turn are reinforced by various practices and laws.

Anglo-American

As noted above, large public corporations with dispersed shareholders and no controlling shareholder became more widespread and dominant in the United States than in any other country. Such corporations are also common in the United Kingdom, and to a lesser extent also exist in Australia and Canada. Such corporations face the conflict between managers and shareholders generally to a more intense degree than other corporations, but do not face a conflict between controlling and minority shareholders. Corporate governance practices and laws in Anglo-American jurisdictions are thus more adapted to the former conflict and less to the latter than the laws of other jurisdictions.

Some believe that there is also a systematic difference between corporate governance in countries with a common law tradition as opposed to those with a civil law tradition. A large literature on law and finance has grown up exploring this hypothesis. This literature hypothesizes that countries with a common law tradition tend to provide stronger protections for investors. This protection leads to deeper and more developed financial markets, which in turn encourages stronger economic growth (La Porta et al., 2008). The theory is controversial (Armour et al., 2009).

Europe and Japan

Corporate governance in continental Europe and Japan is the flip side of the Anglo-American countries. Controlling shareholders exist in most companies, and most countries have

a civil law background. Two other characteristics are particularly noteworthy for the two leading countries in this category, Germany and Japan. First, banks play an important role in corporate governance, through share ownership, lending, and board membership. Second, employees have greater influence in corporate governance, either formally through codetermination in Germany or informally through the influence of senior management in Japan (Aoki, 1987).

Emerging Economies

With strong economic growth in emerging economies, especially China and India, corporate governance in those economies is of growing importance. The basic legal rules for the most part resemble those in more developed economies, although in many emerging economies the quality of court and agency enforcement is questionable. The general tendency is for controlling shareholders to be able to exploit their positions more fully in such economies, as both legal and nonlegal mechanisms provide weaker protections (Dyck and Zingales, 2004).

Corporate governance in China is of particular interest, both because of China's great and growing economic power and because of the still large role of the state (Yang et al., 2011). Many of China's largest corporations are SOEs, with a branch of the state as the controlling shareholder. Corporate governance challenges are heightened in such SOEs, as noted above. Even in nominally private corporations, informal state influence is strong, as the rule of law remains weak and patronage from state officials is important to protect companies from potential predation.

Recent Developments

In the last decade or two there have been a number of major developments in corporate governance, both in the United States and internationally. These developments affect all of the major means of corporate governance discussed above in Means section.

Institutional Shareholder Activism

A growing percentage of the shares of American public corporations are owned by institutions rather than individuals. Some types of institutions have engaged in forms of shareholder activism aimed at influencing corporate governance without trying to gain actual control of a corporation as in the older phenomenon of hostile takeovers. Union and public employee pension funds have been the traditional sources of such shareholder activism, although more recently some hedge funds have also become participants.

Activist shareholders have engaged in two basic kinds of formal campaigns, along with more informal attempts to communicate their opinions to managers. One kind of activism uses shareholder proposals under Rule 14a-8 to attempt to get shareholders collectively to express their opinions on a topic. Traditionally 14a-8 proposals have been nonbinding, although more recently shareholders have proposed bylaw amendments which if passed would be binding upon management. Shareholder proposals have covered a range of topics, from staggered boards to majority voting for directors to executive compensation to proxy access, among others. The other kind of activism attempts to elect shareholder nominees to the board. A major recent legal debate has concerned whether corporations must include shareholder nominees within the corporation's proxy material (so-called proxy access). The US law has not traditionally required proxy access. In 2010, the Securities and Exchange Commission (SEC) enacted a rule requiring proxy access, but it was struck down by the D.C. Circuit Court of Appeals. Currently proxy access is not required, although shareholders may propose bylaws that would require proxy access within a particular corporation. The Dodd-Frank Act added a new limited shareholder voting power: shareholders now have a nonbinding vote on the compensation of the top officers of a corporation. There is much debate over the effect and desirability of these forms of shareholder activism (Ferri, 2012).

Independent Directors

As noted in Section The Board of Directors, both exchange rules and securities laws impose independence requirement on directors of American public corporations. These requirements are recent developments. The exact definition of independence varies somewhat for each rule, but all require that a director not have been employed by the corporation within a certain period of time, and limit other financial ties to the corporation. These rules have been enacted in response to recent financial crises. The first sets of independence requirements were enacted in response to the dotcom crash of 2000. In 2002, the Sarbanes-Oxley Act required that boards have an audit committee which oversees the audit process, and that all members of the audit committee must be independent. In 2003, the New York Stock Exchange and Nasdaq imposed independence requirements for the directors of listed companies. These require that a majority of the board must be independent, and that companies must have compensation, audit, and nomination/governance committees composed entirely of independent directors. The last enactment requiring board independence is part of financial reform regulation enacted following the financial crisis of 2008. In 2010, the Dodd-Frank Act required that compensation committee members all must be independent.

The Rise and Fall of Good Faith

As mentioned in Section Fiduciary Duty, Antifraud Rules, and Shareholder Suits, Delaware courts over the past decade or so have paid increasing attention to the good faith requirement as an aspect of fiduciary duty. Several earlier developments encouraged plaintiffs to plead that defendants had acted in bad faith. If a plaintiff shows a decision or judgment was not in good faith, that decision loses the protection of the business judgment rule, which normally protects directors from liability. Moreover, behavior not in good faith is not covered by the exemption from personal liability that most corporations have adopted as allowed by section 102(b)(7) of the Delaware corporate law. Thus, if plaintiffs succeed in showing that behavior was not in good faith, they avoid two of the main obstacles that usually block them from holding directors

personally liable. Courts have thus had to define what is covered by 'good faith.'

In the *Disney* case concerning the compensation of Michael Ovitz, the court stated that "failure to act in good faith may be shown. . . where the fiduciary intentionally fails to act in the face of a known duty to act, demonstrating a conscious disregard for his duties" (*In re Walt Disney Co. Deriv. Litig.*, 960 A.2d 27, 67 (Del. 2006)). Courts have also used the good faith rubric to analyze a board's duty to monitor behavior by lower level employees. The intentionality requirement in the *Disney* standard has proven to impose a very high barrier to finding directors liable (Hill and McDonnell, 2012).

Gatekeepers

Section Gatekeepers noted a variety of gatekeepers who play an important role in corporate governance. American legal regulation of these gatekeepers evolved significantly in recent years. Regulation of gatekeepers played a major role in the main statutory responses to the two financial crises of the 2000s.

The Sarbanes-Oxley Act, the legal response to the dotcom crash of 2000, focuses above all on gatekeepers. Outside auditors receive the greatest attention. The Act created a new independent agency to regulate auditors, the Public Company Accounting Oversight Board. It also required audit partners to rotate after five years, and limited the kinds of nonaudit services auditors could provide their audit clients. Sarbanes-Oxley required the SEC to promulgate new rules requiring lawyers to report securities law violations up the ladder within the hierarchy of their clients. Sarbanes-Oxley also led the SEC to promulgate Regulation AC, under which research analysts must disclose compensation received in connection with their recommendations.

The other, greater crisis of the 2000s was the 2008 financial crisis, and the legislative response was the Dodd-Frank Act. The main new gatekeeper regulation in Dodd-Frank concerned credit rating agencies, containing many relevant provisions. Administrative agencies are required to remove references to credit ratings from a variety of regulations. Rating agencies are now potentially more exposed to liability for mistakes in ratings. There are new internal control requirements, and a variety of new disclosure requirements.

Federalization

Rules affecting corporate governance in the United States have long been made at both the federal and the state law. However, the core laws creating and governing the corporate law, the basic corporation laws, are set at the state level. Corporations can choose to incorporate in any state, no matter how limited their economic involvement in that state. This has led to a long debate as to whether the competition for corporate charters has led to a race to the bottom (Cary, 1974) or to the top (Winter, 1977).

Until recently, federal rules affecting corporate governance were mostly limited to disclosure and antifraud rules in certain contexts surrounding the issuance and trading of securities. One longstanding exception to this limitation is the proxy voting rules, which have for decades played a major role in structuring shareholder voting procedure for public corporations. However, federal involvement in corporate governance became more broad and widespread in the 2000s with the Sarbanes-Oxley and Dodd-Frank Acts. The previous subsections detail how those acts have affected board independence, shareholder voting, and the regulation of gatekeepers.

OECD Principles

Internationally, one of the most salient recent developments has been the promulgation in 1999 and subsequent spread of the Organization for Economic Cooperation and Development (OECD) Principles of Corporate Governance (OECD, 2004). These principles contain broad standards which both companies and countries are expected to strive to meet. These standards are divided into six categories: ensuring the basic for an effective corporate governance framework, the rights of shareholders, the equitable treatment of shareholders, the role of stakeholders, disclosure and transparency, and the responsibilities of the board.

Convergence

A longstanding debate asks whether the corporate governance systems of different countries are tending to converge toward each other, and whether they should converge. Over time, different countries have been seen as providing the best model to which others do or should aspire. In the 1980s it was Japan; in the 1990s, it was the United States. Some have seen signs of significant convergence, either in legal form or in underlying functional reality (Kraakman et al., 2009). Others are more skeptical of the reality of convergence, or whether the question is even well-posed in the literature (Clarke, 2010). There is much debate as to how to measure the performance of different corporate governance systems. The debate reveals much normative disagreement as to what one should be trying to accomplish through corporate governance, as well as empirical disagreement as to what different systems actually do accomplish. It remains a mystery as to where the corporate governance systems of different companies and countries are headed.

Corporate Law: Publicly Traded Corporations

Arthur R Pinto, Brooklyn Law School, New York, NY, USA

© 2015 Elsevier Ltd. All rights reserved.

This article is a revision of the previous edition article by G. Marchetti and M. Ventoruzzo, volume 4, pp. 2803–2810, © 2001, Elsevier Ltd.

Abstract

The article focuses on the importance of the corporate business form and publicly traded corporations where shares of stock representing its ownership interests can be traded in stock markets. Corporate law primarily deals with protection of shareholders and the need for those who manage the corporation to be able to do so. The share ownership of publicly traded corporations in the United States and in other countries may be widely dispersed without any controlling group of shareholders or concentrated with control groups and the public shareholders in the minority. Each ownership structure had advantages and disadvantages, and there are different explanations of why these differing ownership structures developed around the world. In order to protect shareholders, different approaches have been suggested. In addition, there are differing views on the extent to which corporate law should also protect stakeholders other than shareholders.

Introduction

There is no standard definition for the term 'corporation'; the United States Supreme Court in *The Trustees of Dartmouth College v. Woodward*, 17 U.S. (4 Wheat.) 518, 636 (1819), described it as follows:

> A corporation is an artificial being, invisible, intangible, and existing only in contemplation of law. Being a mere creature of law, it possesses only those properties which the charter of its creation confers upon it, either expressly, or as incidental to its very existence.

Thus, a corporation is a business form that has a separate legal entity from those who own it ('shareholders'), and owes its existence to the state which allows for its formation and provides its attributes. As a separate legal entity there is a separate group called the board of directors elected by the shareholders to oversee the management of the business and select officers to run it (sometimes referred to as 'managers'). There are different types of corporations which have particular issues, rules, and legal issues depending upon the ownership structure. Two significant classifications are closely held and publicly traded corporations. In closely held corporations, there are few shareholders and the distinction between the shareholders and managers may be insignificant because they may substantially overlap. A major issue in corporate law for closely held corporations is to protect minority shareholders from controlling shareholders using their control to benefit them at the expense or exclusion of the minority. There are also publicly traded corporations with large numbers of shareholders whose shares therefore trade in stock markets. Even though the corporation is just one of several ways to structure a business (partnerships, limited liability companies, and sole proprietorships are other forms of business which far outnumber corporations in the United States), the economic impact of the corporate format is significant, since it is the form chosen by most large enterprises that are publicly traded corporations. In addition, the personal savings and retirement investments of many people are invested in these corporations.

In order to organize and create a corporation in the United States, the incorporator must choose the state in which to file the articles of incorporation. Corporate law can be viewed narrowly, as the state law governing corporations that are incorporated in a given state. State corporate law deals with the formation of the corporation, some financing issues, and its internal structure and governance. State corporate statutes are an important source of the corporate rules, but states also have a judicially created common law which creates corporate law that governs various aspects of corporate life. In a broader sense, corporate law can also include other sources of law and rules that are designed to protect investors in the corporation. For example, important sources of investor protection are federal securities law and stock market rules for publicly traded corporations (Pinto and Branson, 2013). Corporate law plays a significant role in dealing with corporate governance which has been described as "the system by which companies are directed and controlled" (OECD).

The article primarily deals with how corporate law allows for the corporate form, publicly traded corporations, and different ownership structures worldwide, the corporate law focus of shareholders and stakeholders, different theories of the firm and allocation of power, and how different ownership systems developed throughout the world.

Corporate Structure

Corporate law allows for the creation of a corporate legal entity separate from its owners and provides for significant corporate attributes. In addition to creation of a separate legal entity, other important attributes include limited liability, free transferability of interests, continuity of existence, and centralized management. As a legal entity, each of these other attributes flow from that entity. These attributes are common in almost all countries (Kraakman et al., 2009).

As a separate legal entity, there is limited liability since the corporation is able to incur its own liabilities, shielding the shareholders as owners from personal liability. Thus, the corporation's creditors cannot usually go after the personal

assets of the shareholders, and the creditors of the shareholders have no right to directly go after the assets of the corporation. This limited liability means that, in most cases, the shareholders will at most lose their investment in the corporation. The shielding advantages are the primary reason why the corporate form is chosen for many businesses.

There are times when a court will pierce the corporate veil removing the shield and allow creditors to pursue remedies directly against the shareholders. Those cases are not common and require some inequitable conduct by those in control who neglect the separate corporate existence. An example would be, if the corporation is unable to pay its debts, the controlling shareholder put insufficient ownership funds into the corporation (thin capitalization), and used corporate assets for personal gain.

Free transferability follows since shareholders are separate from the corporation and they can freely transfer shares to different owners without having an effect on the separate corporate entity. There is continuity because any change in the share ownership of the corporation has no legal effect on the corporation's existence, providing corporations with a perpetual existence. For example, if a shareholder dies the corporation continues.

As a legal entity, the governance can be centralized and separated from the owners. The governing structure of a corporation is composed of the shareholders as the owners of the company, and the board of directors who oversee the management of the company. This legal model allocates to directors and officers the authority to manage while it provides the shareholders, as owners, with some ability to monitor the managers' performance. The board of directors is usually elected by the shareholders at an annual shareholder meeting. In the corporate context, the corporation, as a separate legal entity from its owners, has a board of directors that need not be owners who manage the business.

Corporate law establishes these characteristics but generally each may also be modified by contract among the interested parties and that usually happens in a closely held corporate context. For example, although the corporate form provides limited liability, creditors may insist on personal guarantees from the shareholders to induce the creditors to loan to the business, thus, eliminating by contract shareholders' limited liability.

All of these above attributes are necessary in order to raise large amounts of ownership capital from many shareholders which facilitates the publicly trading of shares and creation of publicly traded corporations. Limited liability attracts passive investors because the most they have at stake is their investment. Free transferability of shares, perpetual corporate existence, and centralized management in a board of directors also allow for the easy trading of shares in stock markets (Easterbrook and Fischel, 1985).

Publicly Traded Corporations and Share Ownership

As closely held corporations grow, they often require substantial capital. To attract capital, a business may have several options. It can attract capital by finding more private investors or having another established business invest in the business. Another alternative is for the business to sell its shares more widely to the public, in an initial public offering, known as an 'IPO,' which is regulated by federal securities laws. The money raised in going public can be used to fund expansion of the business, to pay back the initial investors or its employees who have been given shares. With shares trading the corporation can use shares to buy other businesses by paying with shares or offer stock options (the right to buy shares at a fixed price) to compensate employees and managers. Thus, the option of going public provides flexibility to businesses to raise capital and use its shares for business purposes, and allows founders, employees, and private investors the ability to cash in on their investments.

Once a corporation completes a public offering, the shares are publicly traded in a stock market where investors can continually trade their shares of the corporation. These corporations are subject to stock market rules and federal securities regulation with its emphasis on providing full disclosure to the markets and investors. Most of the well-known large businesses in the United States are publicly traded corporations, i.e., the shares are held by a large number of shareholders and the shares trade in a stock market. The public stock markets provide investors with liquidity because it offers them the ability to sell their investment more easily in the market and thus lessens their risk. Without liquidity, corporations would have to compensate investors for that risk. This liquidity encourages investment and may be beneficial to corporations by lowering their costs of raising capital.

Public markets also provide numerous investment choices, allowing the public to purchase shares in different companies. This makes diversification of investment possible which is beneficial because investors reduce their risks by buying a portfolio of different investments and not owning a large percentage of shares of any one corporation. In most large publicly traded corporations in the United States, there are a large number of widely dispersed shareholders which results in no large or controlling shareholder(s). While directors are elected by the shareholders, the shareholders of many publicly controlled corporations are passive. These shareholders are unlikely to want to incur expenses related to monitoring managers if they do not own a significant amount of shares in their corporation because the cost of activism may be greater than the benefits. But even if there are benefits from activism, a rational profit maximizer would rather let someone else enforce rights on its behalf and thus 'free ride.' Free riding is a problem because it raises an issue of fairness. This problem – where it would be beneficial to act but costs limit such actions – has been described as a collective action issue (Clark, 1986).

Without a concentration of ownership in shares and shareholder passivity, managers (the board and officers) who control corporate assets, information, and the voting mechanisms are in *de facto* control of the corporation with little oversight by the owners, i.e., the shareholders. Thus, these publicly traded corporations are described as experiencing a 'separation of ownership from control.' Because of the vacuum created by the separation of ownership from control, management of many large corporations has become self-perpetuating. This separation of ownership and control can be beneficial when the managers operate the business in ways

that benefit the shareholders. Managers serve as specialists who use their expertise to increase the value of the firm while the shareholders are passive investors who are diversified and supply large amounts of capital, seeking the gains from increases in the value of the business. But separation of ownership from control with dispersed shareholders can also be harmful. Managers can mismanage or act to benefit themselves at the expense of shareholders (Berle and Means, 1932).

While dispersed ownership and the separation of ownership from control has been a significant influence on corporate law development, the US shareholder story is more complex. There are a number of publicly traded corporations in which there is concentrated ownership with a control group, and the public are minority shareholders. These corporations range from traditional, family-founded businesses (e.g., The New York Times) to some high-tech companies (e.g., Google) where control remains with the original owners. It may be more accurate to describe the US publicly traded corporation as a mixture of both dispersed and concentrated owners.

The original story of separation of ownership from control involved individual investors as shareholders. Individual shareholders have historically played a role in the development of corporate law. However, the rise in the number and ownership of large institutional investors has also been important over the last several decades. These institutions consist of private and public pension funds, insurance companies, foundations, hedge funds, universities, brokerage firms, bank trust companies, and mutual funds. Thus, dispersed ownership now includes the presence of institutional ownership, owners that now hold a larger number of shares representing a big dollar investment (albeit still a small ownership percentage overall) compared to individuals. When these institutions act collectively, they can influence their corporations. In the past, shareholders disappointed with their investment would follow the 'Wall Street Rule' and sell their shares rather than try to influence corporate behavior, i.e., choosing exit over voice. Some institutional investors (particularly public pension funds, labor union pension funds, and corporate governance hedge funds) have become more active in the corporations whose shares they own. In addition, institutional investors particularly from the United States have also been playing a significant role in other countries (Pinto, 2009).

Outside of the United States and a few other countries such as the United Kingdom, Canada, and Australia, there are publicly traded corporations where the predominant ownership story is different. Generally, most of those publicly traded corporations have concentrated ownership where there are controlling shareholders while the publicly traded shareholders are in the minority. These controlling shareholders can be a family (many of which were the founding members), another corporation acting as parent company to a publicly traded subsidiary, or large financial institutions like banks or insurance companies. The presence of a large controlling shareholder raises concerns about favoring their interest over the public shareholders who are in the minority. In addition, some publicly traded corporations may have significant state ownership or government links which can mean political influences in business decisions. Just as dispersed ownership greatly influenced the corporate law of the United States, concentrated ownership influenced the corporate law of those countries.

Corporate Law and Other Stakeholders

A significant role of corporate law is the protections of investors in the corporation. Long-term financing of the business can be supplied by its owners or by creditors who lend their money to the business. If capital is lent, then the relationship between the lenders and the business creates a debtor–creditor relationship where the creditor is looking for eventual repayment plus some current return usually in the form of interest on the loan. If the capital is provided for an ownership stake, then the investors are willing to forgo a promise to be paid interest or a set return on the investment for the potential for sharing in the success of the business as owners. Their shareholder investment provides what is called equity for the business as opposed to debt. Because creditors generally have priority in payments for interest and principal, shareholders are at a greater risk but willing to undertake that risk because of the greater return if the business is successful. Those employed by the business can also be viewed as suppliers of human capital and also have a long-term interest in the success of the corporation. Large publicly traded corporations also have other important stakeholders including customers, suppliers, and the community (Licht, 2004).

Because of the importance of publicly traded corporations in society, there is a debate over the focus of corporate governance and the extent to which stakeholders other than shareholders should have a role in governance. The publicly held corporation can be viewed in purely economic terms as a means by which capital is raised from a large number of public savers and used by businesses. Under that focus, corporate governance may focus on the suppliers of capital (creditors and shareholders). While creditors to some extent are protected in corporate law – through disclosure and legal capital rules that focus on dividends and other distributions to shareholders that can harm them – creditors primarily are protected by their contract and bankruptcy law. Since shareholders are the owners and face greater risk than creditors, they are the primary focus of corporate law.

Given the economic significance of publicly traded corporations and their impact on society and other interests, a broader view has long been advocated to include protection of other stakeholders who do not supply capital to the business, e.g., labor (who invests human capital) (Blair and Stout, 1999). An internal perspective on such protection would place stakeholders directly into corporate governance. This could include representation on the board of directors, a voice in corporate decisions or requiring those who manage corporations to have legally enforced duties to protect the stakeholders. In the US, stakeholders are not usually represented on boards, which generally owe their primary duty to the shareholders who select the board of directors. Many countries with concentrated ownership lean toward a stakeholder model. In these countries, stakeholders are protected to a greater extent than in the United States and they have a direct role to play in corporate governance. Germany remains a prime example because of its dual board and co-determination where labor

serves on the supervisory board of publicly traded corporations. In Japan, maintaining long-term employment had been a major goal of corporations.

An external perspective sees stakeholders as outside the internal corporate governance. This may suggest that stakeholders' interests can be protected by the concept of corporate social responsibility which encourages consideration and a positive impact through its activities on the environment, consumers, employees, communities, and other stakeholders. But advocates of shareholder-gain as the sole motive for corporations believe that corporations are formed to run a business for a profit and other activities should not be within their focus. Allowing managers to pick and choose philanthropic or socially beneficial activities permits use of corporate funds for management's personal charities and enables the managers to act as a sort of unelected civil servant. In addition, profit is the yardstick used to measure the success of a business and ultimately, profit maximization is the most socially responsible activity (Friedman, 1970).

Advocates for corporate social responsibility recognize that large publicly traded corporations have considerable power and resources that play a significant role in the economy. Corporations, as part of the larger community, gain from philanthropic activities through enhanced reputation and helping to preserve the advantages that the law provides for businesses. Philanthropy should be encouraged and managers should look to protecting the whole enterprise and not just the shareholders. Reasonable amounts of corporate philanthropy are not only specifically authorized by state statutes and tax deductible but are common and significant.

Corporate social responsibility is fostered by self-regulation as opposed to mandatory rules and now appears to be a goal of many large publicly traded corporations throughout the world. The difficulty is determining the extent to which such policies and goals are real or a form of public relations.

Shareholder Protection and Theories of the Firm

A major focus of corporate law and corporate governance is the protection of shareholders but there are different views of how best to do so. With a shareholder perspective, financial economists and law and economic scholars have often viewed corporate governance and corporate law as an issue of agency costs. In any such relationship, the agent who acts on behalf of a principal does not always act in the best interests of the principal. Thus there are certain costs associated with the relationship called agency costs. Agency costs include monitoring expenditures (costs of supervising the agent), bonding expenditures (the agent attempts to assure the principal that the costs will be minimized), and residual loss (there will inevitably be some cost to the principal). From this analysis, it is generally beneficial to have a system that will reduce these agency costs to the lowest possible level. Corporate law and governance rules are often analyzed with this agency cost perspective using a cost/benefit analysis.

The issue of agency costs in the corporate context and protection of shareholders differs depending upon the ownership structure. With widely dispersed ownership, the shareholders can be conceptualized from a financial perspective as being the principal while the managers (directors and officers) are their agents acting on their behalf. Since shareholders in corporate law do not control managers, this is not a legal concept. The concerns are that the managers will act in ways to harm the shareholders either by mismanaging the business or by self-dealing, favoring their interests over the shareholders. The dispersion of ownership and shareholder passivity allows the managers to control the corporation even though they might own relatively few shares. In this context, issues arise as to how to lower the agency costs and potential losses as well as what bonding and monitoring mechanisms are best. In determining legal protection, there also needs to be a balance so that those who manage are able to take the risks necessary to promote the business (Jensen and Meckling, 1976).

With concentrated ownership, there is a group of shareholders constituting the majority who control the business while the minority are the public shareholders. Under the agency cost perspective, the controlling shareholders are viewed as the agents and public minority shareholders as principal. In this context, issues may arise concerning the control group's relationships if it engages in conflicts of interest transactions or policies that favor their interest over the minority. There are different views as how to best protect shareholders. In the US, this debate has produced different theories of the firm for publicly traded corporations and different views on how corporate law should allocate power.

The law and economics approach or contractual model recognizes the need for shareholder protection and favors shareholder wealth maximization. Under this approach, managers should run the business and abuse by managers would be controlled with market-based solutions as the optimal way of looking at the firm and for lowering agency costs. Markets present a more efficient (cost less and benefit more) means to monitor the agency relationship. For example, if managers are poorly managing the business the stock price would decline. The low share price may encourage shareholders to challenge directors through shareholder voting (called a proxy fight because in publicly traded corporations shareholders vote by executing proxies in advance of a meeting rather than attend) to replace directors. A low price could also induce a bidder to try to buy the corporation which if opposed by the managers is a hostile takeover. Therefore, management fearful of losing their positions will attempt to manage efficiently and in favor of shareholders to keep the share price high. This is an example of the market for corporate control providing a check on managers. In light of the monitoring of the markets, the law and economics model argues that corporate law should only facilitate market mechanisms or provide rules when markets fail and are unable to constrain managerial behavior (Easterbrook and Fischel, 1991).

Some law and economics theorists also conceptualize the corporation in terms of contract law. A corporation can be viewed as a nexus of contracts through which various claimants such as creditors, workers, shareholders, and consumers enter into agreements. Private contracts are viewed as an efficient means to lower costs in the agency relationship between the shareholders and managers. One can view the articles of incorporation and the bylaws as a contract between the shareholders and the managers setting out the rules governing their relationship. This private ordering through

contracts allows the parties to provide rules to maximize value and minimize costs. Under this view, corporate law should provide the basic terms of these contracts (i.e., default rules), but the shareholders and the managers should be allowed to change the terms, thus providing an optimal and mutually agreeable system (Easterbrook and Fischel, 1989). While many corporate law rules can be waived or modified because the statutes explicitly allow for it, critics of the contractual approach argue that some minimal protection and regulation is needed, and some of the rules should not be changed so easily. One of the most convincing arguments against all rules being subject to contractual modification is that in a publicly traded company there is no real bargaining over the terms of the contract. Management controls the structure and timing of the process while shareholders are widely dispersed, unable to act collectively (Clark, 1985). Although the contract theory has not been adopted for all corporate rules, it remains influential and does provide a framework for analyzing those rules. Courts and legislatures have taken the theory into account in fashioning rules. Generally speaking, in civil law countries one finds more mandatory rules where common law countries allow for more opting out of statutory legal rules (Pistor, 2002).

A regulatory approach seeks stronger state law protection of shareholders and an increased federal presence through an expansion of the reach of federal securities law. Given the failure of markets and passivity of shareholders, certain corporate rules must be made mandatory to assure minimal standards to protect shareholders. These rules can be enforced by government actors and private litigation by shareholders. There are also different approaches on how power should be allocated within the corporation. One is a management approach favoring laws that give managers (officers and inside directors) tremendous latitude in their activities. This model is premised on the idea that managers will protect the interests of shareholders because they have a mutual interest in protecting the corporation. Although managers do not own large numbers of shares, their livelihood depends upon a successful company. Thus, the shareholders and managers share the similar goal of corporate advancement. Directorial primacy and centralized decision making is the essential attribute of efficient corporate governance and discourages intershareholder opportunism. In addition, managers are often in the best position to consider the different demands on the corporation and are thus well suited to advance corporate interests and consider other constituencies such as labor and the community (Bainbridge, 2005). However, there are often conflicting ways in which managers seek corporate advancement. For example, some managers might see expansion or enlargement of the corporation as being in the company's best interest, but that may not be beneficial to the shareholders.

Concerns about the lack of management accountability have led some commentators to argue for increased shareholder powers and easier mechanisms to replace or influence managers. Shareholders as owners should be able to protect their investment and need to be given the power to do so especially to effectuate significant decisions (Bebchuk, 2005). But there are concerns that increased shareholder power will undermine the efficient management of corporations and even harm other stakeholders.

In a comparative context, the US has a managerial model where shareholders have less direct power over the directors compared to other countries where shareholders can implement and vote on more issues (Ruggiero and Bruno, 2011).

Dispersed versus Concentrated Ownership

As discussed, publicly traded corporations are often viewed through the lens of ownership, with the widely dispersed shareholder model used in the US and concentrated ownership generally found elsewhere. Important comparative corporate governance scholarship has focused on these different ownership structures with explanations of why these different systems developed and whether one system is more optimal. If one system is viewed as more advantageous, then the lesson on how and why each developed may be instructive for future developments of corporate law and economic development. A number of different explanations have tried to explicate the reasons for the different ownership patterns. These explanations can be broadly described as law matters, history and politics, private ordering, interest groups, and deep causation.

Law matters was based upon leading financial economists' empirical research comparing countries with dispersed and concentrated ownership. Their empirical evidence found significant differences in the legal protection of investors between countries. They initially told a story that the absence of law protecting shareholders in many countries explained the emergence of the different systems. Without strong legal protection, shareholders had little choice but to maintain control, which was one way to monitor managers and protect their investment. The more protective the law was to investors, the more likely the emergence of widely dispersed ownership. Thus concluding that the law determined the ownership structure, system of corporate finance, and governance. Generally it was common law legal systems that allows for judicial law creation and flexibility was more protective than the civil law. While some have questioned the studies as incomplete and limited, the *law matters* thesis set the agenda for much of the significant comparative corporate governance scholarship (La Porta et al., 1998, 1997).

The other explanations were responses to the *law matters* story. They all recognize a role for law but see other explanations for why dispersed ownership did or did not emerge. The *history and politics* explanation views politics as the important determinant of ownership structure. In the United States, political factors such as hostility to bigness in government and in business meant legal limits on large financial institutions which helped prevent the rise of strong owners (Roe, 1994). In Europe, social democracy in postwar Europe was a political outlook that promoted welfare of all citizens and prevented wide disparities, resulting in considerable government control in addressing social inequalities, such as unemployment. Given the ever present possibilities of government interference with an enterprise, owners enter into pacts with labor and government to maintain favorable social policies (often in return for protection of management interests) and limit market-based capitalism with dispersed owners despite the existence of market-friendly laws. Thus, *history and politics* was determinative in the development of particular ownership systems (Roe, 2003).

A *private ordering* explanation suggested that *history and politics* painted too broad a picture. Some countries, like the United Kingdom with a social democratic background, developed dispersed capitalism. What mattered was private ordering or contracting (e.g., stock market rules or role of private bankers and investors) which allowed optimal substitutes from formal law, and some countries, like the United Kingdom, developed systems of private ordering which provided investor protection that law followed to solidify or formalize activities created by the local interests. Under this view, law matters if it allows for private ordering and the common law is more adaptive and accepting of such ordering. Thus, private ordering and self-regulation can have the effect of constraining society (Coffee, 2001).

An *interest group* explanation suggested a different political story which related the issue of widely dispersed shareholders to the creation of liquid securities markets and to how open a country is to outside investment. While politics may be relevant, it is not social democracy but the protectionism of local interests that keeps markets closed from competition. Thus, the key to dispersed ownership, raising capital, and improved corporate governance is a market-based system and open competitive trade. This is because certain countries cut back on openness to finance because new financial entrants threaten established, local interests and can cause short-term disruption by supporting new firms that threaten the established order. The established companies and financial providers use the popular political opposition generated by this disruption strategically, e.g., to cut down on the access to financial capital by local companies. The country becomes worse off and declines, as local (particularly new) businesses lose competitively priced capital, but the established elites guard their privileged position (Rajan and Zingales, 2003).

In looking at explanations for the development of ownership structures, some have explored whether *deep causation* can help explain different ownership systems. Legal rules themselves are not a complete story and a societal explanation, which includes cultural factors and studies that correlate between these cultural factors and the law, is a fuller story. For example, while shareholder rights are higher in countries belonging to the English-speaking cultural region, these countries are no better than others in protecting creditors. This casts doubt on the alleged general superiority of statutes in common law countries for protecting investors. The implication for a deep causation approach is that legal change may not have a significant effect without cultural norms that promote investor protections (Licht, 2001).

Both dispersed and concentrated ownership systems have advantages and disadvantages. The widely dispersed model relies more on markets for financing and the importance of liquidity for investors. A deeper and more liquid capital market may be beneficial to corporations by lowering their cost of raising money. Further, publicly traded corporations provide disclosure, allow for investors to cash in on their investments which encourage the creation of new businesses, and allow for greater societal participation in ownership. But dispersed ownership allows for managerial abuse. In addition, publicly traded markets have the disadvantage of being volatile and at times may be subject to speculation and bubbles. Such concerns may lead to short termism by corporations. Concentrated ownership systems relies more on financial institutions such as banks for both finance and monitoring and can be viewed as more patient than markets for long-term planning. Concentrated ownership deals with the agency problem of the managers by providing close monitoring of management but there is a different agency problem of controlling shareholders taking advantage of the minority shareholders in publicly traded corporations (Maher and Andersson, 2000).

Later studies using the *law matters* thesis elaborated further on the relationship between ownership and corporate performance. Research suggested that increased legal protection and dispersed ownership is in fact beneficial compared to the concentrated ownership system. Increased legal protection encourages not only dispersed ownership but the related depth of the capital markets which can lower the cost of capital for corporations and foster economic development. Thus *law matters* not only in creating dispersed shareholders but for economic development. If concentrated ownership is a poor substitute for markets, the solution for both developed and developing countries may be a legal one, i.e., changing law to protect investors to encourage greater use of markets (La Porta et al., 2002). The other explanations such as politics and deep causation suggest changes may be more difficult. Corporate governance and law may be strongly 'path dependent': i.e., certain political forces push a country down a particular path, and it then becomes difficult for the country to pull itself out of the path when local interests and institutions develop connections to and affinities for the path (Bebchuk and Roe, 1999).

Globalization in trade, capital markets, and multinational corporations have had an impact on the different corporate governance systems. Increased trade increases competition which has the effect of breaking down local barriers resulting in increased competition in the products market. This open competition directly affects the performance of a country's firms. This raises the issue of whether a particular corporate governance model is a factor in a firm's performance. Another economic aspect of globalization is the internationalization of the capital markets. With the expanded markets resulting from trade, firms raise capital and investors invest globally. Competition for capital means that corporations seeking capital would need to provide good governance practices to attract investment. In addition, investors will demand such practices in order to invest. If certain corporate law or practices can attract capital more cheaply then this may provide an economic advantage in the firm's performance and a country's overall economic well-being (Pinto, 2005). In addition, there may be some convergence in the 'shareholders and stakeholders models' described earlier (Gordon and Roe, 2004).

Corporate Taxation

James R Hines, University of Michigan, Ann Arbor, MI, USA; and NBER, New York, NY, USA

Abstract

Corporate taxation is an important source of government revenue around the world and a major consideration in planning business activities. This article reviews the economic considerations raised by corporate taxation and evidence of the behavioral impact of taxation.

Scope and History

Corporate tax obligations consist of both direct and indirect taxes. Direct taxes are typically expressed as fractions of corporate income, whereas indirect taxes include sales taxes, value added taxes, excise taxes, property taxes, payroll taxes, and import and export duties. Corporate indirect tax payments exclusive of payroll taxes commonly exceed their direct tax payments in overall magnitude (Desai et al., 2004a). Much of the interest in corporate taxation nevertheless turns on the direct tax component, since the indirect taxes such as value added taxes are imposed on all business activities, whether or not undertaken by corporations.

The corporate income tax rate structure is usually progressive, meaning that average tax rates rise with income, typically reaching a maximum rate rapidly enough that almost all of the income of large corporations is subject to tax at the highest rate. In the United States in 2014, corporations earning net income up to $50 000 paid a 15% tax; this tax rate rose to 25% on income above $50 000, 34% on income above $75 000, and was 35% on income above $10 million. Other countries tax corporate income at similar rates that can vary according to the size, location, and industry of the corporate taxpayer.

Much popular and public policy attention is devoted to the tax planning activities and corporate tax obligations of big businesses – and with good reason, since corporate income tends to be concentrated in a relatively small number of large companies. For example, in 2011 there were 5.8 million active corporations in the United States, of which 2831 had assets exceeding $2.5 billion. These 2831 large corporations accounted for 81% of total US corporate assets, 68% of net corporate income, and 68% of total corporate tax payments.

The American federal corporate income tax was introduced in 1894 but was found unconstitutional the following year; it reappeared as a gross receipts tax in 1909, and was modified to become a genuine income tax following ratification of the 16th amendment to the US constitution in 1913. The US corporate tax rate in 1913 was 1%. The corporate tax rate rose over time, though it remained below 15% until World War II, at which point it rose sharply. The corporate tax was a major revenue source for the US federal government between World War II and the late 1960s, when corporate tax collections consistently represented more than 20% of federal government revenue. Corporate tax collections have since fallen as a fraction of total government revenue, though federal corporate tax collections exceeded $220 billion for tax year 2011, when total corporate tax collections by all levels of US government were 9.4% of total government revenues, or 2.3% of US gross domestic product (GDP). In the same year, the 34 OECD countries collected corporate tax revenue that averaged 8.7% of total government revenues, or 3.0% of GDP. The US (federal plus average state) statutory corporate tax rate in 2013 was 39.1%, making it the highest of all the OECD countries, which averaged 25%, and which included five countries (Ireland, Slovenia, Poland, Hungary, and the Czech Republic) with statutory corporate tax rates below 20%.

Impact on Economic Behavior

The taxation of corporate income encourages entrepreneurs and managers to structure and conduct their business operations in ways designed to avoid taxes. Corporations generally reduce their tax obligations, and those of their shareholders, by using debt rather than equity finance, investing in assets that can be rapidly depreciated for tax purposes and those for which generous tax credits are available, and avoiding dividend payments or other tax-disadvantaged distributions to investors (Auerbach, 2002).

A major tax consideration in corporate finance is that interest payments to bondholders are deductible from taxable income, whereas dividend payments to corporate shareholders are not deductible. As a result, corporations generally have tax incentives to issue more debt than they would otherwise, effectively replacing equity finance with debt finance in order to reduce taxable corporate income. The magnitude of the incentive to use debt finance is an increasing function of interest rates and tax rates, and there is ample evidence (Graham, 1996; Desai et al., 2004b) that firms facing higher corporate tax rates (because they are located in countries with high corporate tax rates or because they have very low probabilities of incurring tax losses) have higher debt/asset ratios than other firms. Since dividend payments typically generate tax obligations for recipients, corporations also have incentives to buy back shares or use other nondividend methods of distributing income to shareholders, and while they persist in paying dividends, there is evidence that taxation of dividend receipts at the shareholder level discourages dividend payouts (Chetty and Saez, 2005).

Tax incentives to issue debt are mitigated in situations in which firms anticipate nonrefundable tax losses, or in which

 http://dx.doi.org/10.1016/B978-0-08-097086-8.71013-0

there is strong investor preference for returns in the form of capital gains and dividends rather than interest income. The strength of investor preference for stock ownership depends on circumstances. Individual investors most strongly prefer owning a firm's stock to owning its bonds if they reside in countries that permit dividend recipients to claim credits for corporate taxes paid on income generating dividends, though most tax systems – primarily those in European countries – that once featured this type of corporate integration no longer do so. In countries without such personal and corporate tax integration, the favorable tax treatment of accruing capital gains means that some investors, typically those in the highest tax brackets, prefer stock ownership (despite the associated corporate tax obligations) to holding interest-bearing debt. With sufficient numbers of such investors, it follows that asset markets will price stocks and bonds so that the economy's debt/equity ratio increases with the corporate tax rate, while any individual corporation is indifferent between debt and equity finance (Miller, 1977).

Taxation influences the timing, magnitude, and composition of corporate investment in plant and equipment, inventories, research and development, and other business assets. Higher tax rates generally are associated with lower investment levels (Djankov et al., 2010), though this depends on tax treatment of investment expenditures. Investors generally do not reduce taxable income immediately by the full amount of spending on business investment, instead amortizing the cost of investment spending over a period of years in which 'depreciation allowances' are permitted. These depreciation allowances are most valuable if claimed soon after an investment is undertaken, since they are seldom adjusted for inflation and the time value of money. Hence governments that seek to encourage business capital formation often do so by permitting investors to depreciate their investments for tax purposes over short periods of time. Governments also often provide special tax credits for investments in selected asset categories such as research and development (available in many countries, including Australia, Brazil, Canada, China, France, India, Japan, Spain, the United Kingdom, and the United States). Depreciation allowances and investment credits together have the potential to stimulate investment by reducing required rates of return (Hall and Jorgenson, 1967). These tax considerations are succinctly captured by "effective tax rates" (Auerbach and Jorgenson, 1980) on business investment, which can be usefully compared over time and between countries (King and Fullerton, 1984). The available evidence indicates that rates of business investment are inversely related to effective tax rates (Chirinko et al., 1999; Hassett and Hubbard, 2002), though the effect of tax changes on investment levels is dampened by adjustment costs that firms incur when abruptly changing their capital stocks (Goolsbee, 1998; House and Shapiro, 2008).

Corporate taxation also affects business organization by discouraging the incorporation of profitable businesses that can be organized in noncorporate form. In the United States, business organizations whose income is not subject to the corporate income tax include small ('S') corporations, partnerships, sole proprietorships, and limited liability companies, and establishing a company with one of these organizational forms is an alternative to setting up a new corporation. There is evidence (Da Rin et al., 2011) that among European countries higher corporate tax rates are associated with reduced rates of forming new corporations.

The Taxation of Multinational Corporations

Multinational corporations – those with active business operations in more than one country – pose special problems for tax systems, since it is necessary to determine the location and character of taxable income, as well as the means by which double tax relief is to be provided. Double tax relief is essential because a corporation's home country claims the right to tax all of its income, including the income earned by its foreign affiliates, while host countries in which foreign affiliates are located insist on their rights to tax affiliates' incomes. In the absence of tax relief, income earned by foreign affiliates would be subject to taxation both by host countries and by home countries at cumulative rates that would often be prohibitive to business operations.

There are two practical systems of international double tax relief, both of which permit countries to tax fully any income earned by economic activity undertaken within their borders. Double taxation is avoided whenever home countries forego taxing multinational corporations on income earned by their foreign affiliates, or else when home countries tax the incomes of foreign affiliates but permit taxpayers to claim credits for foreign taxes paid. Use of the credit method effectively subjects income earned by foreign affiliates to home-country taxation at a rate equal to the difference between home and foreign tax rates. Actual methods of double tax relief often resemble a combination of these two methods. A majority of the world's countries exempt from tax most of the income earned by foreign affiliates of domestic multinational corporations, though 7 of the 34 OECD countries, including Ireland, Mexico, Poland, and the United States, subject such income to taxation but permit credits to be claimed for foreign taxes.

There is ample evidence that international tax rate differences influence the timing and location of investment by multinational corporations (Hines, 1996, 1999; Gordon and Hines, 2002). Countries and subnational jurisdictions that tax corporate income at low rates receive unusually large volumes of foreign direct investment, particularly from countries that do not tax foreign income. Furthermore, multinational firms arrange their business transactions to avoid international taxes. Thus, foreign affiliates located in high-tax countries tend to be financed with higher debt/equity ratios than are investments in low-tax countries (Desai et al., 2004b; Huizinga et al., 2008), and are more likely to remit profits in the form of (deductible) royalty payments than (nondeductible) dividends. Only a small fraction (16% in 1984) of the foreign affiliates of American companies pay dividends to their parent companies each year, those that do tending to have particularly tax-advantaged situations (Hines and Hubbard, 1990; Desai et al., 2001; Dharmapala et al., 2011). And the pretax profitability of foreign affiliates is negatively correlated with host-country tax rates (Hines and Rice, 1994; Huizinga and Laeven, 2008; Clausing, 2009), which is suggestive of

tax-motivated income reallocation, though these simple correlations may overstate the extent to which taxpayers are able to adjust their own tax liabilities this way (Dharmapala and Riedel, 2013; Hines, 2014).

Incidence of the Corporate Income Tax

The requirement that corporations pay taxes does not mean that owners of corporations necessarily bear the burden of the corporate tax, since this burden might be partially or entirely shifted to consumers in the form of higher prices, or to workers in the form of lower wages. Indeed, there are reasonable situations in which the existence of the corporate tax actually enhances returns to capital owners, including owners of corporations (Harberger, 1962).

Corporate tax obligations contribute to the cost of investment and thereby encourage substitution of other productive factors (such as labor) for capital used by corporations. Labor expenses are deductible against taxable income, so the corporate tax does not affect the marginal condition characterizing a firm's decision of whether or not to employ additional labor. While the substitution of labor for capital depresses the demand for capital and thereby reduces its after-tax market return, there exists a separate effect of corporate taxation that stems from its induced intersectoral reallocation of resources.

Corporate taxation increases the cost of producing corporate output, thereby raising output prices, depressing demand, and shifting output from the corporate sector of the economy to the noncorporate sector. This reallocation affects factor demands to the extent that factor input ratios differ between the corporate and noncorporate sectors of the economy. If the corporate sector of the economy has a lower capital/labor ratio than the noncorporate sector, then the introduction of a corporate tax shifts resources into the noncorporate sector and thereby raises the demand for capital. If this effect is large enough, then it has the potential to exceed in magnitude the countervailing impact of factor substitution, thereby implying that higher rates of corporate tax are associated with greater after-tax returns to capital – including capital invested in corporations. It would then follow that labor bears the burden of the corporate tax in the form of lower wages.

The distribution of the corporate tax burden is an important area for future empirical research. The limited available statistical evidence is largely inconclusive and mostly quite old (Krzyzaniak and Musgrave, 1963), making it difficult to know what groups in the population currently bear the burden of corporate taxes. The globalization of business activity may add an important dimension to the incidence of corporate taxes, since international capital flows tend to reduce the impact of corporate taxes on the returns to owners of corporations, and instead shift the burdens to owners of other productive factors (Harberger, 2006).

This article is a revision of the previous edition article by G. Kennedy, volume 4, pp. 2816–2820, © 2001, Elsevier Ltd.

Abstract

This article introduces basic concepts of a modern linguistic corpus and corpus linguistics. A corpus is defined as a collection of examples of language in use that are selected and compiled in a principled way and corpus linguistics as linguistic studies of such corpora. We explicate classification, basic procedures of data collection, construction, and annotation of corpora. Representative research areas and applications where corpus and corpus-based analysis play crucial roles are also introduced. Finally, trends and future directions of development of corpus linguistics are discussed.

What Is a Corpus?

A corpus is a collection of examples of language in use that are selected and compiled in a principled way. The term corpus refers to the intention for it to be a representative body of evidence for the study of language and language use. In the most general terms, the purpose of a corpus is to document a language. Hence a corpus is often an essential component of *language documentation* or *language archives*. Corpora are often used in language sciences, including linguistics, computational linguistics (CL), language education psycholinguistics, sociolinguistics, and translation studies, as well as other studies where a collection of texts or other language uses are crucial, such as anthropology, communication studies, literary studies, or political science.

What Is Corpus Linguistics?

The term *corpus linguistics* refers to corpus-based linguistic studies in general (Biber et al., 1998; Tognini-Bonelli, 2001, among others). Archetypical corpus work existed well before the modern digital era, as exemplified by the early attempts of word indexing and concordancing of the Christian Bible in the thirteenth century. However, the emergence of corpus linguistics as an academic discipline is closely linked to the availability of digital tools to record, store, and examine corpora, heralded by the rapid development of computational technology as well as the increasing availability of digital content since the second half of the twentieth century. Although the use of computational and statistical tools plays crucial roles in corpus linguistics now, it is important to note that the two essential elements in corpus linguistics are the study of linguistic issues and the use of corpora. Thus 'computer-aided armchair linguistics,' the term Charles Fillmore fondly coined in 1992 (Fillmore, 1992), still applies to corpus linguistics to the extent that both linguistic theories and argumentation are required to lay the foundation of corpus-based processing and analysis.

The first modern corpus is the Brown University Standard Corpus of Present-day American English ('the Brown corpus'; Francis and Kučera, 1979; Kučera and Francis, 1967), compiled at Brown University in the 1960s. With about one million words of text collected from a balanced, wide variety of sources, the Brown corpus represented a breakthrough in terms of both corpus size and corpus design. In subsequent years, however, the standard of corpus size increased rapidly. Thanks to the enhanced storage and processing power of modern computers, it is now not uncommon to encounter a corpus that contains hundreds or thousands of millions of words. What came hand in hand with the increase in scale was the expansion in genre. In addition to the so-called 'balanced' corpora (see below for the definition of *balanced*) such as the Brown corpus, corpora have also been developed for highly specialized domains and with unconventional data types (e.g., multimodal language data, text collected from the World Wide Web (WWW)).

Building a Corpus

Design Criteria

The construction of a corpus starts with decisions on design criteria. Corpus design criteria are mainly driven by the purpose of the corpus, but may also be affected by meta-theoretical concerns such as evaluation methods, reusability, and interoperability. Pragmatic concerns such as data availability, sharability, as well as budgetary and technical constraints may also play a role. In setting up a set of design criteria, it is important to bear in mind that a corpus is meant to be a representative body of linguistic data as evidence; hence the question of whether the design criteria will yield the right sample of data to address the questions posed must be asked. The design criteria will determine what kind of data to collect, how much and how to collect, what kind of information will be annotated on the data, and by what method.

Data Collection

Corpus construction begins with the collection of raw language data. As stated earlier, corpus developers need to first decide on the purpose of the corpus (i.e., *Language use in which domain(s) of human life will be represented in this corpus?*) based on which they may decide further where to collect data. Data collection in the earlier stage of corpus linguistics involves both selection and digitization of text. With the advance of the WWW and the accessibility of digital content, data collection of modern corpora typically involves manual or automatic selection or extraction of electronic texts. Both methods, however, require an elaborated and challenging effort to clear copyrights to the

acquired texts, unless a specific text is already in the public domain. The recent emergency of the Web as Corpus (WAC, see Baroni et al., 2009) approach, which treats the WWW as a source of data, has the potential to side-step some, but not all, copyright issues. Under the WAC approach, computer programs (which are called *robots*) are designed to crawl the web and collect data according to a set of predetermined criteria. Robots are usually designed to extract only a small portion of text from each website in order to meet the fair-use requirement. Another WAC method to circumvent the rights issue is to collect as much data as needed but only share the extracted generalization, and never the original data in pure text form, to users. Two best known corpora taking this approach are Google's n-gram corpus, which gives users access only to the collection and statistics of n-grams (n consecutive words) but not the original text; and Liverpool's WebCorp, where concordance lines are dynamically extracted and not saved. Discussion on corpus and corpus construction will be focused on the typical corpus as a collection of text in what follows.

Balanced versus Specialized

A *balanced* corpus (also referred to as a 'general corpus') is designed to represent the use of a certain language in all domains with the consideration of relative frequency of language use in each domain. Therefore, the data of a balanced corpus are representative of all topics, genres, styles, and registers, coming from a potpourri of sources which often include (but not limited to) books, magazines, newspapers, academic journals, and TV programs, with a controlled proportion of each data source and data type. The proportions are decided by the corpus developers in some principled way, e.g., according to the number of publications in each source/type in a certain time period. Most existing balanced corpora are of the English language, with the Brown corpus setting the standard for early corpora, and the British National Corpus (BNC) setting the standard for more recent work. Balanced corpora of other languages are also available, such as the Academia Sinica Balanced Corpus of Modern Chinese (Sinica Corpus) and the Balanced Corpus of Contemporary Written Japanese (KOTONOHA or BCCWJ). Balanced corpus can also be constructed to represent variations of the same language, such as the International Corpus of English.

A *specialized* corpus, as the name suggests, only represents the use of language in a specific domain or for a specific topic. The range of specialized corpus varies widely from single author corpus (e.g., a Shakespeare corpus), single genre corpus (e.g., a Twitter corpus) to single domain corpus (often a corpus of language for specific purpose, e.g., a corpus of engineering English) and so on. A specialized corpus can also be complied for the purpose of a specific research topic area, such as a learner's corpus for the study of second language learning, an acquisition corpus for the study of first language education (e.g., CHILDES), an emotion corpus, a language disorder corpus, or a metaphor corpus.

Synchronic versus Diachronic

A *synchronic* corpus contains language data that are produced in roughly the same time period, whereas a *diachronic* corpus contains data from different time periods, which may or may not be consecutive. For instance, a corpus of Shakespeare's works is synchronic, but a corpus of English literature in the seventeenth–twentieth centuries would be diachronic. Diachronic corpora are often used in historical linguistics and the study of language change, thus the time span must be long enough for changes to be observed. The emergent field of evolutionary linguistics also relied heavily on diachronic corpora for modeling and simulation. Most balanced corpora are synchronic, simply because compiling a balanced corpus with enough data to cover an extensive time span would be too overwhelming of a task.

Spoken, Written, or Mixed

A *spoken* corpus contains transcribed speech, whereas a *written* corpus contains only written text. Of course it is possible to have both spoken data and written data in a corpus, resulting in a *mixed* corpus. An example of written corpora is the Brown corpus, which only included published written works. Some more recent balanced corpora, such as BNC, included both written works and transcribed spoken data, in recognition of the vast differences between written and spoken language (Chafe and Tannen, 1987; Halliday, 1994). The past three decades have witnessed the emergence of a number of corpora with only spoken data, such as the SWITCHBOARD corpus of telephone speech and the Buckeye corpus of conversational speech. Since these corpora usually contain speech recordings and phonetic transcription alongside word transcription, they are often used for studying phonetics and phonology, as well as speech recognition and processing.

Single Language versus Multilanguage

As the names suggest, a *single-language* (or *monolingual*) corpus contains data from only one language, whereas a *multilanguage* (or *multilingual*) corpus contains data from more than one language. A multilanguage corpus can be either a parallel corpus or a comparable corpus (see below for the differences between the two). Earlier multilanguage corpora are mostly parallel corpora, while comparable corpora became more popular recently with the availability of original electronic data from more languages on the web. Multilanguage corpora are widely used in translation studies, computer-assisted translation, machine translation, and other language-related computer technologies. The first widely used multilanguage corpus is the Hansard Corpus of English and Canadian French from Canadian parliamentary proceedings, which contain texts in both English and Canadian French.

Parallel versus Comparable

A *parallel* corpus contains texts of the same content in different languages (e.g., an original text and its translation(s) in one or more other languages). Hence directionality is crucial for a parallel corpus. For example, a parallel English–French corpus will be different from a parallel French–English corpus, even if they are both based on the same text. The parallel relation between the source and target also varies according to the nature and purpose of translation. Parallel corpora containing texts with legal or documentary functions, such as parliamentary proceedings, tend to maintain lexico-syntactic correspondences, while those containing texts that are informative or expressive tend to maintain semantic-pragmatic correspondences. One of the most important steps in

processing a parallel corpus is alignment, which can be performed at lexical, phrasal, sentential, or paragraph level, depending on the nature of the corpus as well as the purpose of the study. Comparable corpora, on the other hand, are multilanguage corpus containing a collection of texts from two or more languages collected under the same set of criteria. Comparable corpora are less costly to construct since they do not rely on translators to create the target texts. They also allow comparative study of two languages in similar native language production context, in contrast to parallel corpora, where target language text is more restricted and may contain unnatural texts. It is also possible to construct a large comparable corpus without having to translate all the texts from source language. Hence the comparable corpus approach opens up the possibility of constructing a multilanguage corpus in language pairs without qualified translators or sufficient pre-existing translated texts.

Annotation and Storage

As mentioned earlier, modern corpora are digitally stored. In particular, to facilitate future processing by computer programs, corpora must be stored in a 'machine-readable' electronic format. To this end, a popular approach is to use the Extensible Markup Language (XML) for encoding and storing corpus files. Raw language data may require some preprocessing, e.g., converting text on paper to electronic text, transcribing speech, and adjusting electronic text format, before they can be stored in an XML format.

An XML file contains two types of elements: content and markup. In a corpus XML file, content mainly consists of the linguistic data collected for the corpus. Markup, on the other hand, is a major place for adding *annotation* to the linguistic data, which may be any extra information about the text.

Corpus annotation has become a critical step in corpus construction (see Stede and Huang, 2012) in spite of the fact that annotation is not a mandatory component of a corpus and that corpus annotation is typically costly and labor-intensive. A simple reason for the convention is that annotation enriches a corpus and facilitates discovery of generalizations and knowledge which is difficult, if not impossible, to obtain from a raw corpus. For example, the annotation of author gender will be crucial for analyzing any gender-related phenomenon in language use. Take another example. Many English words may be used with more than one part of speech (POS) (e.g., 'table,' 'convict'). If someone is to research the use of 'table' as a verb, it will be much more convenient if he or she uses a corpus with POS tags, which would allow word search to be restricted by POS and therefore prevent search results to be overwhelmed by instances of 'table' used as a noun. In addition, POS tagging also facilitates various natural language processing (NLP) applications such as information retrieval and machine translation.

A corpus can be annotated at three different levels. Most corpora are at least encoded with some basic metadata (such as author, publication date, genre) which are attributes of the text as a whole. There are also corpora in which the texts are tagged with grammatical information, phonetic transcription, or other linguistic or extralinguistic information for a specific purpose of study. Overall, the text encoding initiative (TEI) provided the XML schema for encoding of all levels of corpus annotation. TEI aims to ensure that members of its community of practice will be able to share their annotated digital output. Even though TEI is designed for the wider community for all digitalized texts, it has been adapted as the standard format for corpus annotation. First, for the encoding of metadata, Dublin Core is the *de facto* standard of the open archives community, and is adapted by the Open Language Archives Community for language resources including corpora. Second, the tagging of linguistic information, which is the most common and most versatile level of annotation, can be applied to all kinds of corpora and can easily be reused. POS tagging is the most commonly applied annotation. When literatures in corpus linguistics refer to a tagset, it means the set of POS tags used in a corpus by default. All currently available balanced corpora are POS-tagged, and a corpus that is annotated with other information typically has a name that explicitly refers to that annotation level, e.g., prosody corpus (a syntactically annotated corpus, however, is conventionally called a *treebank*). It is also important to note that although the most commonly assumed unit in a corpus is a word, it is possible to annotate units smaller than words. For instance, a corpus of speech data can be segmented into phonemic or phonetic units, which are labeled with segmental phonetic transcriptions, although the same corpus could also be annotated with suprasegmental features that span across multiple segments (or even words). The General Ontology of Linguistic Description is a community of practice effort to define and standardize all linguistic features that can be annotated on a language resource. A parallel effort to provide a uniform and sharable linguistic annotation scheme is the Lexical Markup Framework group (Francopoulo, 2013), which works in conjunction with ISO TC37 SC4 to produce an ISO standard for linguistic annotation: ISO 24613:2008. Finally, a corpus can also be annotated with extralinguistic features to enable it to support specific research. For instance, in a Learner's Corpus, the common annotation scheme, on top of POS tagging, identifies the errors and error types made by a language learner. An emotion corpus can be annotated with both the emotion type and emotion-related event structure.

Standard procedure of corpus annotation starts with drafting of annotation guidelines based on linguistics or other theoretical criteria. Annotators are trained and their performance is evaluated before given the actual task. Annotation tasks are usually carried out in a double-blind manner, meaning a pair (or more) of annotators annotating the same text without input from each other. After the annotation is completed, the annotations where both (or all) annotators agree on are assumed to be correct, and the annotations where there are disagreements, they are presented to an adjudicator, often the person who drafted the guidelines, to decide upon. Hence, the measurement of interannotator agreement is often taken to be a good indicator of the quality of corpus annotation. Although the earliest corpus started with manual annotation, modern corpus annotation is typically carried out electronically with an annotation tool. The tool may also have the capacity to provisionally predict the annotation based on either statistic or heuristic rules. The annotator's main role is then to correct wrong predictions or to supply annotation when the program fails to provide any annotation. Fully

automatic annotation can be employed when the corpus scale is too big for human annotation, such as with the WAC approach. In this case, a tolerance of error rate is predetermined and the program is tested on a sample corpus with gold standard (i.e., correct) annotation to make sure that it does not make excessive errors before the program is deployed. Such automatic annotation programs typically employ either machine learning algorithms or stochastic models; they are sometimes also supplemented by heuristic or hand-crafted linguistic rules.

Crowdsourcing is a recent innovation in corpus annotation which has the potential to generate a paradigm shift. Crowdsourcing relies on web users to perform tasks that require human intelligence, typically the kind of tasks that a computer program has limitations in. Corpus annotation falls nicely to the category of human intelligence tasks. The typical procedure for crowdsourced annotation also starts with the design of annotation guidelines, especially with presenting the guidelines with examples to ensure least ambiguity for workers who take on the task. The corpus owner then publishes this task on the web through a crowdsourcing platform, with optional monetary compensation. The workers who accept the task must typically pass a pre-test to show that they have the knowledge or skill to perform the task. Since the compensation is low and since the number of potential works on the web is big, crowdsourcing allows a corpus to be annotated by multiple annotators with a fraction of the cost of dedicated annotators. The larger number of annotators allows corpus owner to have a wider range and more reliable data to determine which annotation is more reliable. The most popular crowdsourcing platforms for language-related studies are Amazon Mechanic Turks and Crowdflower.

Corpus Linguistics: Research and Applications

The topics in corpus linguistics research are not different from (computational) linguistic research. The only differences are in the approaches to how data are collected and to how generalizations are arrived. Hence, we will focus on research topics generated by and solved with corpus linguistics.

Corpus Processing Tools

The design and improvement of corpus processing tools is an ongoing issue in corpus linguistics. The Natural Language Toolkit gives a good overview of what kind of tools and resources are available or required for corpus processing. First of all, tokenizer or lemmatizer is often required as the first step of corpus processing. Since not all languages conventionally mark the boundaries of words, and even with those that do, not all boundaries are consistently marked (e.g., 'the White House' is a single word), hence tokenization is an important first step for languages without conventionalized word boundary markers. For example, the tokenization task for Mandarin Chinese, which is more specifically referred to as Chinese word segmentation, remains an active research topic (see Huang and Xue, 2012). Lemmatizer, on the other hand, can play the same function as tokenizer in languages with rich morphology. At word level, it serves the purpose of enabling words which undergo regular or irregular morphology to be recognized as tokens of the same type of words (e.g., 'buy' and 'bought'). It also enables generalizations of the behaviors of affixes. Second, a POS tagger is dependent on a well-designed tagset, a comprehensive lexicon as well as strategic information from distributional properties of each POS. Finally, a parser can assign syntactic structure to a corpus, which is not only crucial for construction of treebanks but also allows event structure to be defined and annotated on a corpus. All these processing tools lay the foundation for more advanced corpus analysis such as word frequency counting or automatic identification of grammatical relations (see below for more discussion on corpus analysis).

Applications of Corpus

The first and best known application of corpus is in lexicography. The COBUILD team demonstrated that high-quality dictionaries and grammars can be produced based on corpus data (Sinclair, 1987). Today, all major dictionaries/lexica in English are corpus based and some with a very powerful user interface are able to provide linguistic generalization automatically. Since the first application in lexicography, corpus has played an increasingly important role in general linguistic research. By definition, a corpus contains a large amount of naturally occurring language data and therefore becomes an ideal data source for investigating language and language use. It is not uncommon now for a study of syntax or semantics to cite example sentences collected from natural corpora. For this purpose, the most often used corpus analyses are word frequency counting, concordance, and keyword in context, all of which are standard functions available in most corpus websites and corpus analysis software. A more advanced tool is Sketch Engine (Kilgarriff et al., 2004), which automatically extracts grammatical relations based on statistical patterns in the corpus. In addition to syntactic and semantic research, the use of corpus is especially important in discourse analysis and studies of language variation. While discourse analysis usually employs qualitative analysis aided by the commonly used corpus analysis tools listed earlier, a corpus-based study of language variation typically uses quantitative analysis with statistical models built on large datasets extracted from the corpus for the examination of variation patterns.

Today, corpus has also become an indispensable component in CL research. Currently almost all major CL applications (e.g., information retrieval, sentiment and emotion analysis, machine translation, speech recognition and synthesis) heavily rely on corpus data and the use of corpus-based approaches. Since the core of a CL application often involves recognizing some patterns or features of the language data, the application typically makes use of two sets of corpus data: a training set and a testing set. The training set contains data that have already been tagged (often manually) with gold standard annotation, which are then used to train the CL program to calculate the heuristic and statistical rules for automatic annotation. Goodness of the program may be evaluated by comparing the annotation results with the gold standard annotation on the same dataset. Later, the trained CL program will be applied to the testing dataset in order to obtain automatic evaluation. Obviously, the more similar the training set and the testing set

are, the more likely it is for the trained CL program to gain success with the unseen data in the testing set. In reality, it is often recommended that the two datasets are sampled from the same corpus (or corpora of a similar type) in order to ensure high data similarity. The earlier description also indicates a close relationship between corpus linguistics and CL. While corpora provide the essential resources for CL research, the latter also contributes novel and efficient ways to process and annotate corpus data.

Trends and Future Directions of Corpus Linguistics

There are a number of noteworthy trends in the development of corpus and corpus linguistics. First of all, as mentioned earlier, a general trend is that corpora are becoming increasingly larger than before, thanks to the development of computers and corpus technology. Second, the establishment of various corpus construction and annotation standards promises the emergence of more 'standardized' corpora with high reusability and interoperability. In the past decade, we have also noted the fast development of multimodal corpora, which contain not only textual data but also nontextual audio or video data, making it possible to study language use in a broader cognitive and communicative context. Such corpora have been proved highly useful in the study of child language development and nonverbal communication. Finally, there are also some emerging trends related to the development of the WWW. As noted before, novel technology such as crowdsourcing has been employed in the process of corpus construction, making annotation more efficient and economic. Another trend is the use of language data crawled from the web, i.e., the WAC movement, which easily produces gigantic corpora of naturally produced text although questions about data quality also arise.

Overall we are highly optimistic about the future of corpus linguistics. Given the current achievement and the emerging trends, we are looking forward to a future where corpora make even greater contributions to linguistic research and applications, language professions, and the broader fields of social and behavioral sciences.

EDITOR IN CHIEF BIOGRAPHY

James D. Wright received his bachelor's degree in philosophy from Purdue University in 1969, a master's degree in sociology from the University of Wisconsin in 1970, and his PhD in sociology from Wisconsin in 1973. His first academic appointment was at the University of Massachusetts, Amherst, where he was promoted to Associate Professor in 1976 and to Full Professor in 1979. Most of his 15 years at Massachusetts were spent as Director, Associate Director, or Director of Research in the Social and Demographic Institute.

Wright left Massachusetts for Tulane University in New Orleans in 1988 where he served as the Charles and Leo Favrot Professor of Human Relations in Tulane's Department of Sociology. He also enjoyed a courtesy appointment in the Tulane School of Public Health, Department of Biostatistics and Epidemiology. He left Tulane in 2001 to become the Provost's Distinguished Research Professor of Sociology at the University of Central Florida. In 2003, he was named as the Director of the University's Institute for Social and Behavioral Sciences and in 2013, was designated as a UCF Pegasus Professor, the University's highest faculty honor.

Wright was the Editor in Chief of the scholarly journal *Social Science Research* from 1978 until 2014. His previous editing experience also includes a 20-year stint as editor of the Aldine de Gruyter book series *Social Institutions and Social Change*, two editions of the *Handbook of Survey Research* (Academic Press, 1983; Emerald Publishing, 2010), and service on the editorial boards of numerous journals. He is the author of 21 books and scholarly monographs on topics ranging from homelessness to research methods to NASCAR, and he has published more than 300 journal articles, book chapters, reviews, essays, and polemics. Wright lives with his wife Christine Stewart and their multiple dogs and cats in Winter Springs, Florida, where in his spare time he likes to cook fancy meals for large crowds.

PREFACE TO THE FIRST EDITION

Large and ambitious works such as the present Encyclopedia depend on countless instances of input, cooperation, and contextual support. Therefore, the editors in chief would like to express their gratitude to several institutions and individuals. Our most general thanks go to our respective home institutions, the Center for Advanced Study in the Behavioral Sciences, Stanford, and the Max Planck Institute for Human Development, Berlin. We are certain that without the effective infrastructures of these institutions and the rich collegial networks and intellectual climate they provide, implementing this Encyclopedia in such a short amount of time would not have been possible. In this context, we also need to mention that due to the administrative budgets provided to the editors in chief by the publisher, the financial strains on our home institutions were minimal. Such a situation may be a rarity in the modern world of scientific publishing where publishers often press scholars and institutions into taking on larger and larger shares of the publication enterprise.

Aside from the more than 4000 authors, our deepest thanks goes to the editors of the 39 sections, to whom we delegated many decisions at various stages, who were primarily responsible for developing the lists of articles and authors, and who stood as the main gatekeepers of scientific quality for the entries in their sections. As a group, the section editors displayed remarkable energy, intelligence, and tolerance for the inevitable frustrations of tending large numbers of authors over a long period of time. Because of the brevity of the acknowledgment of the main editorial coproducers here, we alert the reader to the list published as part of the front matter and the description of their extensive work we offer in the Introduction. We would also like to mention that one of our highly esteemed section editors, Franz Weinert, died unexpectedly during the last phases of his editorial work. For people who had the pleasure of knowing Franz Weinert, it comes as no surprise that he completed his editorial duties without ever complaining about the difficult health conditions he was facing. He was a gentleman and a distinguished scholar.

The International Advisors also gave wise counsel on several designated occasions, and a number of these scholars represented on the International Advisory Board took more initiative — always helpful — than we had originally asked. The International Advisory Board was particularly helpful in the process of choosing section editors. Some of its members assisted us ably as we attempted to make the Encyclopedia as international as possible and also in dealing with special problems that are part of a large project with close timelines. Thus, we remember a few occasions where members of the International Advisory Board helped us with their substantive and social competence to deal with matters of editorial disagreements. Because of the overall quality, collaborative spirit, and professional responsibility of our section editors, these events were rare indeed, but dealing with them required masterful and accelerated input. We appreciate the collegiality that members of the Board displayed when called upon in these special circumstances.

In addition, and as described in the Introduction, there was a host of esteemed colleagues who gave us advice on numerous questions such as author and editor selection, organizational matters, topics for entries, content and quality of selected articles, substantive and methodological niches to be covered, as well as last-minute author replacements. The number of such individuals is large indeed, and most likely, significantly larger than the list presented below. There were too many short, but nevertheless significant collaborative encounters that we likely did not deposit into our long-term memory or written documentation. We apologize for such oversights.

In this spirit, we appreciate the advice given in the three planning meetings in Stanford, Uppsala, and Dölln/Berlin by the following scholars: Peter Behrens, Burton Clark, Gordon Clark, Lorraine Daston, Meinolf Dierkes, Jean-Emile Gombert, Torsten Husén, Gérard Jorland, Ali Kazancigil, Wolfgang Klein, Gardner Lindzey, Renate

Mayntz, Andrew Pettigrew, Denis Phillips, Marc Richelle, Ursula M. Staudinger, Piotr Sztompka, Eskil Wadensjö, Björn Wittrock, and Robert Zajonc.

We would like to extend special thanks to Laura Stoker, who pinch-hit for Nelson Polsby (section editor for Political Science) who was unable to attend the meeting of section editors in April 1998; and to Linda Woodhead, Senior Lecturer in Religious Studies, Lancaster University, who assisted David Martin with editorial work at all phases for the section on Religious Studies.

We also acknowledge the help of scholars who advised Smelser and Baltes at the stage of pulling together the entry lists, proposing authors, and occasionally reviewing the content and quality of articles submitted.

Smelser thanks: Jeffrey Banks, Peter Bickel, Edgar Borgatta, Charles Camic, Jennifer Chatman, Jean Cohen, Michael Dear, Pierre Ducrey, Eckart Ehlers, Sylvie Faucheux, Steven Guteman, Frank Furstenberg, Helga Haftendorn, Peter Katzenstein, David Laibson, Stephan Lauritzen, Douglas McAdam, Eleanor Maccoby, Phyllis Mack, Cora Marrett, Douglas Massey, Donald Melnick, Harvey Molotch, Lincoln Moses, James Peacock, Trond Petersen, Andrew Pettigrew, Alejandro Portes, Matilda Riley, István Rév, John Roberts, Dorothy Ross, Rob Sampson, Fritz Scharpf, Melvin Seeman, James Short, Fritz Stern, Carol Swain, Ann Swidler, Ken'ichi Tominaga, Charles Tilly, Wolfgang van den Daele, Sidney Verba, Margaret Weir, Thomas Weisner, and Jennifer Wolch.

Baltes is very grateful to: Nancy Andreasen, Gerhard Arminger, André-Jean Arnaud, Jens Asendorpf, Jan Assmann, Margret Baltes (deceased), Jürgen Baumert, Peter Behrens, Manfred Bierwisch, Niels Birbaumer, Peter Bloßfeld, Walter Borman, Robert F. Boruch, Mark Bouton, Michael Bratmann, David Buss, Shelley Chaiken, Lorraine Daston, Juan Delius, Marvin Dunnette, Georg Elwert, Helmut Fend, Hans Fischer, Peter Frensch, Alexandra M. Freund, Dieter Frey, Jochen Frowein, Gerd Gigerenzer, Snait Gissis, Peter Gollwitzer, Ian G. Gotlib, David Gyori, Heinz Häfner, Helga Haftendorn, Giyoo Hatano, Adrienne Héritier, Theo Herrmann, Otfried Höffe, Ludger Honnefelder, Paul Hoyningen-Huene, James Huang, Günther Kaiser, Heidi Keller, Martina Kessel, Gábor Klaniczay, Wolf-Hagen Krauth, Achim Leschinsky, Karen Li, Shu-Chen Li, Ulman Lindenberger, Elizabeth Loftus, Gerd Lüer, Ingrid Lunt, Hans J. Markowitsch, Laura Martignon, Randolf Menzel, Dietmar Mieth, Susan Mineka, Setsuo Miyazawa, John R. Nesselroade, Claus Offe, Vimla Patel, Meinrad Perrez, Rosa Lynn Pinkus, Robert Plomin, Neville Postlethwaite, Thomas Rentsch, István Rév, Peter Roeder, Richard Rorty, Hubert Rottleuthner, Peter Schäfer, Heinz Schuler, Norbert Schwarz, Richard J. Shavelson, Joan E. Sieber, Burton Singer, Wolf Singer, Edward Smith, Hans Spada, Günter Spur, Rolf Steyer, Michael Stolleis, José Juan Toharia, LeRoy B. Walters, Elke U. Weber, Peter Weingart, and Reiner Wimmer.

There was one more group that played a special role in the editorial review (see also Introduction). Baltes was assisted by a team of colleagues who provided expert input to the section editors and to him during final review: Gregor Bachmann, Alexandra M. Freund, Judith Glück, Wolfgang Klein, Olaf Köller, Shu-Chen Li, Ulman Lindenberger, Ursula M. Staudinger, and Christine Windbichler. Their expertise in helping us to ensure quality is gratefully acknowledged.

The day-to-day organizational work of the editors in chief occurred at their respective research centers — the Center for Advanced Study in the Behavioral Sciences and the Max Planck Institute for Human Development in Berlin. Smelser singles out Julie Schumacher, his main assistant in the project, for her organization of the meeting of section editors, and her superb coordination of the flow of correspondence and manuscripts over several years. She remained firm when the rest of us were faltering, and displayed the greatest efficiency, intelligence, and good cheer. Smelser also relied on periodic help from Leslie Lindzey, Kathleen Much, Jane Kolmodin, and Anne Carpinetti. Michelle Williams of the University of California, Berkeley, served as his main editorial assistant for nearly 2 years, going over all entry manuscripts from the standpoint of readability, and carrying a great part of the cross-referencing work; her judgment was always the best, and Smelser is forever indebted to her.

At the Max Planck Institute for Human Development, and aside from Julia Delius (see below), Baltes expresses his deeply felt thanks to the main secretarial staff in his office (Helga Kaiser, Romy Schlüter, Conor Toomey) who during the preparation of this Encyclopedia took on larger shares of responsibilities for other projects and occasionally helped out when the editorial office was overloaded. More directly involved in the day-to-day operation of the Encyclopedia was Penny Motley, who efficiently functioned as project secretary during the planning phase. During the main phases of the project, it was Yvonne Bennett who was responsible for secretarial and organizational matters. She deserves much applause for her superb and efficient help in the day-to-day running of the editorial office, making sure that all manuscripts and proofs were processed quickly, and also for assisting with the organization of various meetings. Not least, Baltes thanks the administrative office of the Max Planck Institute, and there especially Nina Körner and Karin Marschlich, for their competent work in managing the project budget, as well as Sabine Norfolk who handled most of the numerous fax

transmissions with ever present smiles and friendliness. Finally, in the Berlin editorial office, thanks are also due to Susannah Goss for her excellent work in translating individual articles into English.

Individual section editors wish to thank the following scholars who gave them substantive advice in their work: Richard Abel, Itty Abraham, John Ambler, Karen Anderson, Mitchell Ash, Alan Baddeley, Boris Baltes, Manfred Bierwisch, Michael Bittman, Sophie Bowlby, John Carson, Shelly Chaiken, Roger Chartier, François Chazel, Stewart Clegg, Carol Colby, Philip Converse, James Curran, Jerry Davis, Natalie Z. Davis, Peter Dear, Juan Delius, Michael Dennis, Josh DeWind, Sherry Diamond, Elsa Dixler, Georg Elwert, Howard Erlanger, Drew Faust, Malcolm Feeley, Nancy Folbre, Michael Frese, Angela Friederici, Lawrence Friedman, Bryant Garth; Victor Ginsburgh; Marcial Godoy, Frances Goldscheider, Calvin Goldscheider, John H. Goldthorpe, Reginald Golledge, William Graziano, Stephen Gudeman, Mauro Guillen, Doug Guthrie, John Hagan, Eric Hershberg, Steve Heydemann, Stephen Hilgartner, Judith Howard, William Howell, Jill Jaeger, Bob Kagan, Joe Karaganis, Roger E. Kasperson, Ronald Kassimir, Robert W. Kates, Wolfgang Klein, Hans-Dieter Klingemann, Bert Kritzer, Kay Levine, Steven Lukes, Michael Lynch, Akin Mabogunje, Stuart Macaulay, Donald MacKenzie, David Magnusson, Michael McCann, Sally Merry, Peter Meusburger, Sieglinde Modell, John Monahan, Kevin Moore, Gerda Neyer, Hiroyuki Ninomiya, Jodi O'Brien, Eva Oesterberg, Mark Osiel, James L. Peacock, Susan Phillips, Trevor Pinch, Wolfgang Prinz, Sheri Ranis, Harry Reis, Estevao C. de Rezende Martins, Marc Richelle, Leila Rupp, Gigi Santow, Austin Sarat, Simon Schaffer, Linda Scott, Tim Shallice, Seteney Shami, Ronen Shamir, Susan Silbey, Wolf Singer, Sheila Slaughter, Gerhard Strube, Ursula M. Staudinger, J. Stengers, Stephen M. Stigler, Michael Stolleis, Mark Suchman, Denis Szabo, Verta Taylor, Ashley Timmer, David Trubek, Leslie Ungerleider, Don Van Arsdol, Jakob Vogel, Rita Vörg, Judy Wajcman, Mary Wegner, Wlodzimierz Wesolowski, Steve Wheatley, Björn Wittrock, and Vincent Wright (deceased).

Section editors also thanked the following persons for their research assistance: Pamela Anderson, Susan Augir, Anja Berkes, Chantale Bousquet, Aida Bilalbegović, John Clark, Susanne Dengler, Kathrine Derbyshire, Annie Devinant, Casey B.K. Dominguez, Barbara Dorney, Elizabeth Dowling, Tracey L. Dowdeswell, Carolyn Dymond, Debbie Fitch, Susannah Goss, Verhan Henderson, Andrew Hostetler, Gudrun Klein, Heike Kubisch, Angie Lam, Ellen Lee, Valerie Lenhart, Kay Levine, Allison Lynn, Helena Maravilla, Carol B. Marley, Marion Maruschak, Michael McClelland, Rhonda Moats, Birgit Möller, Katja Neumann, Linda Peterson, Justin Powell, Paul Price, Xandra Rarden, Chris Reiter, Deborah Sadowski, Heidi Schulze, Heidi Sestrich, Keith Smith, Judith Thompson, Karen Varilla, Stuart Vizard, Danelle Winship.

It is difficult to single out one person as especially helpful. Despite the risks involved, we would like to highlight one person (see also Introduction). As shown in the front matter, beginning in the second year of the planning phase, Julia Delius served as our scientific editorial assistant. For our internal process of editorial review and management, Julia Delius was the mastermind of editorial coordination. Her work was simply outstanding.

Finally, we express our thanks to several individuals at Elsevier publishers whose work was both essential and helpful to us throughout. Barbara Barrett started the ball rolling for the entire Encyclopedia project, and was a master at negotiating out the fundamental arrangements at the beginning. Geraldine Billingham, as executive editor, also played an important role in the development of the project, as well as carrying the heavy responsibility for ensuring that all the financial and operational aspects of the project were realized. She executed this work with directness, skill, and tact. Angela Greenwell coordinated the editorial process with dexterity, calmness, and good judgment. Three persons were responsible for monitoring the progress of entries from Elsevier's side: Michael Lax for a time at the beginning; Jayne Harrison, who carried an overwhelming load of manuscripts month after month, and Helen Collins, who was responsible for the equally demanding job of shepherding the manuscripts through the entire production process. Ruth Glynn skillfully and imaginatively masterminded the development of the electronic version within Science Direct. We know how much the success of the Encyclopedia has depended on these individuals and their staffs, and our appreciation and admiration is here recorded.

Our expressions of gratitude and respect for the authors, section editors, reviewers, counselors, and editorial team, however, are not meant to distract from our own responsibilities as editors in chief. Let us hasten to add, therefore, that those whom we acknowledge deserve most of the credit but little of the blame for whatever shortcomings remain.

Neil J. Smelser

INTRODUCTION

Alan Sica's article in this encyclopedia observes, "The urge to systematize and rationalize both common and esoteric knowledge has been strongly and continuously in evidence for at least 2400 years in the West" (Sica, 2015). Sica dates the origins of this urge to Plato's nephew Speusippus, who took up the challenge of Plato's call for an *encyclopedia* (from Greek words meaning 'general education'), and traces the urge though Pliny the Elder, Vincent of Beauvois, Francis Bacon, Denis Diderot, and a great many others. Today, an encyclopedia is simply a self-contained reference work "with two aims: to include up-to-date knowledge about a particular discipline or group of disciplines and to make this knowledge conveniently accessible" (Smelser and Baltes, 2001). Such are the aspirations of the present work.

Histories of the concept of an encyclopedia are widely available and need not occupy us here. Those interested in where the *International Encyclopedia of the Social and Behavioral Sciences* (IESBS) fits into the long history of encyclopedias will do well to consult the Sica article quoted above or the Smelser—Baltes 'Introduction' to the first edition of this work.

This is the second edition (2/e) of the IESBS. Elsewhere, I acknowledge my immense debt to the editors of the first edition, Dr Neil Smelser and Dr Paul Baltes. Without their perspective and template to follow in assembling the second edition, this version would have scarcely been possible. The very thought of an encyclopedia covering *all* the social and behavioral sciences, one that drew on scholars from *all* corners of the globe, is itself so audacious that one would hesitate even to begin without a pretty detailed road map to the terrain.

On the occasion of the publication of Robert E.L. Faris's widely acclaimed *Handbook of Modern Sociology*, Joseph Gittler was moved to ask, "With the plethora of new handbooks, reviews, and compendia in sociology, one wonders whether there is a need for yet another one." That question was posed almost 50 years ago; the ensuing half-century has been marked, as Sica says, by "an avalanche of reference materials the likes of which had never been seen in libraries prior to about 2000." So readers and critics are within their rights to ask: Why a second edition? Why now?

The first edition (1/e) was reviewed in *Contemporary Psychology* as "the largest corpus of knowledge about the social and behavioral sciences in existence" (Park, 2004). According to readily available data sources, IESBS 1/e has been cited nearly 6000 times in subsequent scholarly literature and has an h-index ($h = 24$) that would be the envy of many full professors. Citations are only one measure of impact, of course, and probably not the most important measure for a basic reference work intended more for students and a general audience than for practicing professionals. In addition to the thousands of scholarly citations, items from IESBS 1/e were 'hit' almost two *million* times on Science Direct between online publication in November 2002 and August 2014 — two million instances where IESBS 1/e was likely consulted as a basic reference source, to get quickly up to speed in a new area of research or to provide background for a paper or project, or just to satisfy a reader's curiosity. The first edition, in short, emerged soon after publication as a go-to reference work throughout the social and behavioral sciences. Michael Shanahan referred to the first edition as "the atomic bomb of reference works." It was thus an easy conclusion that the work had sufficient value to keep it alive and current.

In reading selected articles from the first edition, however, I was taken aback by how much and how quickly they had aged. The first articles I looked at were those pertinent to my own areas of research and in nearly every case, there was important recent work that I felt needed to be discussed. With the assistance of colleagues in other areas of the social and behavioral sciences, it became obvious that this was a general problem. To be sure, much of the material in 1/e has enduring value; indeed, roughly half the articles in 2/e are updated and revised items from the first edition. Still, it is sobering to realize just how quickly the frontiers of social science

knowledge shift and thus how quickly a basic reference source becomes dated. I am certain there are articles in the current edition that are already in need of some updating.

Smelser and Baltes enumerated six criteria that guided their decisions about what to include and what to leave out. The criteria are as follows:

1. secure knowledge, realizing that security of knowledge is a dynamic and relative term,
2. knowledge with balance and comprehensiveness,
3. knowledge that is integrative rather than fragmented,
4. knowledge that places the evidence into historical and theoretical context,
5. knowledge that highlights connections between topics and fields, and
6. knowledge that combines, where possible, theory and practice.

I would like to say I have followed these same criteria in determining the content of 2/e, but all six criteria have proved problematic in one or another way and thus deserve some comment in light of the present work:

1. What is secure knowledge today is apt to be recognized as wrong tomorrow. Many of our requests for updates to 1/e articles generated some response to the effect, "All of this is completely obsolete. We need to write a new entry from scratch." One would expect this to be true of areas of research such as behavioral genetics, say, or cognitive neuroscience or other fast-moving scientific fields, but it also turns out to be true of archaeology, history, and philosophy. The leading edge of research in *every* discipline threatens received wisdom; those who content themselves with received wisdom ('secure knowledge') will quickly find themselves behind the times. So our charge to authors was to focus less on the 'secure knowledge' in their respective fields and more on the cutting edge — the new perspectives, methods, findings, and issues that will animate social and behavioral science research in the coming decade.
2. Throughout the social sciences, the distinction between theory and ideology is sometimes difficult to discern, and so too the distinction between applied research and community or political activism. We need not invoke Max Weber's conclusions about the impossibility of a truly value-free social science to understand that ideological undertones and political preferences can often be detected in social science research work; sometimes, they are quite explicit. Nor is it much of a surprise to learn that many social scientists struggle, not always successfully, to distinguish between what they want the world to be and what the world in fact is. Such struggles are part of the process by which knowledge develops and are thus in evidence in many of the 2/e articles. It would be unwise to enforce by editorial fiat a consensus on issues that the social sciences themselves have yet to resolve.
3. The fragmentation of knowledge *across* disciplines is far more serious that the fragmentation of knowledge *within* them, although the latter is a problem as well. Many well-informed sociologists, for example, take pride in reading widely and can speak with some authority about what is going on in the field, even in areas of sociology that do not directly concern them. I assume this is also true of the other social and behavioral science disciplines and areas. But rare is the sociologist who is cognizant of work being done, say, in social geography *even when*, as is often the case, the fundamental problems, theoretical issues, and methodological approaches are similar. This is a widespread problem across the disciplines: The evolutionary psychologists do not know as much as they should about what the anthropologists are doing; the economists ignore a lot of pertinent work in sociology and political science; etc. For better or worse, disciplinary differentiation is an inherent element in the process of knowledge development and discovery, so this is a reality to be faced, not a problem to be solved. We dealt with this reality mainly in two ways: (1) Authors were encouraged wherever possible to think across rather than strictly within their disciplines. (2) Calling relevant work done in other disciplines to the reader's attention was a guiding principle for the choice of cross-references for each article.
4. Social-constructionist theories of knowledge would argue that knowledge does not become knowledge until it is placed in historical, cultural, social, political, and theoretical context. As put very simply and succinctly in the opening line of the famous text by Berger and Luckmann, "reality is socially constructed" (1966: 1). This is no less true of social science knowledge than knowledge in any other realm. Unfortunately, a great deal of what we think of as social science knowledge is based on biased samples of WEIRD people — that is, Western, Educated, Industrialized, Rich, and Democratic (Henrich et al., 2010). (The same point has, of course, been made by many others.) The WEIRD, thus defined, represent a rather exotic minority group judged by world standards, and the challenge for IESBS 2/e was therefore twofold: (1) to recruit non-WEIRD editors and authors where possible; and (2) to persuade all authors to incorporate comparative, cross-cultural, and

international themes and perspectives wherever it was possible to do so. This effort was more effective in some sections than in others. Moving away from nation-specific literature, themes, and results to a truly *international* (the I in IESBS) account of the social and behavioral sciences was an ever-present *desideratum* in my discussions with editors and authors.

Alas, an emphasis on cross-culturalism often brings to light that everything, or nearly everything, seems to vary by culture, subgroup, ethnicity or nation, and at that point the question arises whether social science generalization is even possible. Are there universals that cross all social groupings? Or does social science dissolve into a mist of group-specific particularities that adduce no general principles? That hardly seems desirable. Yet myopic and ethnocentric fixations on one's own society or culture are scarcely to be encouraged either.

The worst offenders in this regard tend to be social scientists from the USA (and from the West more generally), who, of course, also comprise the largest share of editors and authors for IESBS 2/e. True, as with greenhouse gases, the USA (and the West) also produce the largest share of the world's science, social and otherwise, and so it is inevitable that they also represent the largest share of IESBS 2/e contributors. The Swedish social anthropologist Ulf Hannerz wrote about this very issue in his marvelous essay, "Editing Anthropology" (Hannerz, 2010). Hannerz quotes a Canadian anthropologist who said of the "neighborly presence" of US anthropology that it was like being "in bed with the elephant." The same is true of most or all of the disciplines covered in this work. But then in a passage remarkable for both its insight and its generosity, Hannerz remarks, "No doubt tensions and conflicts may arise out of this situation, but perhaps it is better to understand that the elephant cannot help being an elephant, and that it makes sense for it, in its habitat, to behave in elephantine ways. A well-trained elephant, too, can do a lot of good, such as in carrying heavy loads." So if the elephant that is Western social and behavioral science has been pressed to carry the heavier load in these pages, that is, the price to be paid for being an elephant in the first place.

The larger issue here is that the social and behavioral sciences, which were largely birthed in the West, in Europe and the United States, mainly address a trans-Atlantic scientific dialogue, a dialogue that is carried out almost exclusively in English. Indeed, throughout much of the world, a scientist's stature is indexed in part by his or her success in publishing in English. Publications in the native language are simply *assumed* to be inferior. The main exceptions, tellingly, are French and German social scientists whose native-language publications are valorized. A Dutch or Portuguese or Hungarian social scientist who only published in the native language would be seriously punished in merit and tenure reviews. Elsevier's citation database Scopus *requires* English-language abstracts before a journal will even be considered for inclusion. And English (with American spellings) is likewise the official language of this encyclopedia. No resources were made available to get articles submitted in other languages translated (although several such articles were submitted). Inevitably, this biases the encyclopedia's coverage in favor of social science addressed to the trans-Atlantic dialogue. Consequently, a great deal of excellent social science published in Spanish, or Mandarin, or Farsi, or any of the other world languages, is overlooked.

That said, steps were taken to improve the internationalism of the encyclopedia's coverage throughout the 4 years of its development. To begin, I sought area and section editors from around the globe and urged them whenever possible to seek international (vs strictly Western) authors. Articles were often returned to their authors with explicit instructions to add international coverage. And when all efforts failed and we ended up with articles that were unmistakably restricted to a single nation in their coverage (frequently but not always, this was the US), I indicated the national focus in the article subtitle. Still, a great deal more WEIRD social and behavioral science remains in these pages than would be desirable in an *international* encyclopedia. In a later section, I give the national breakdown of everyone involved in this project.

5. An encyclopedia that "highlights connections between topics and fields" is easier to envision than to accomplish. Criterion (3) above speaks to the disciplinary fragmentation of our social science knowledge. William Easterly, the NYU economist, has written about the 'tyranny of experts' but the tyranny of the disciplines is an equal problem, a tyranny sanctified by the very academic structure of the modern university, where the separate and often warring colleges are each comprised of assorted departments, the latter representing basic academic disciplines. Interdisciplinary programs are almost invariably relegated to various centers, institutes, or specialized research laboratories — in short, to the periphery of the university's power structure. And while everyone *says* they want to encourage multi- and interdisciplinarity, very little is done to make that happen. Instead, departments remain as the fundamental unit of academic organization.

   Hortatory admonitions to editors and authors have made IESBS 2/e somewhat more interdisciplinary than its several predecessors, but in the end, the disciplinary emphasis in many of our articles would be hard

to overlook. Still, there are many sections of the work that were clearly developed with interdisciplinarity in mind and in which one finds interdisciplinary social science at its current best: environmental and ecological sciences; health; life course; sexuality; GLBT studies; public policy; evolutionary sciences; war, peace, violence, and conflict; and genetics, behavior, history, and society are a few sections that come immediately to mind.

I am particularly pleased with the extensive coverage given in 2/e to the interactions between the biological and social sciences. Harry Whitaker once remarked in a private e-mail that "we are all witnesses to the marriage of biology and the social sciences." Many of the articles found here are offspring of that marriage. And those articles leave little doubt that the future offspring of this marriage will be among the most exciting and insightful social science products of the coming decade.

The social sciences once resisted everything biological as rank reductionism; in addition, the social scientists have always feared that a mature and complete biology would eventually drive us out of business. Articles included in IESBS 2/e make it clear that 'nature' versus 'nurture' was the wrong question from the very beginning, that what we need to understand is how biological inheritance and social and cultural forces *interact* to produce individual and collective outcomes. This is where a lot of the interesting action in the social sciences is going to be in the coming years.

6. The coverage of the practical or applied sides of the various disciplines has been increased in this edition, so the applied content of 2/e certainly exceeds that of its predecessor. New to this edition is the entire section on applied social and behavioral sciences; also new is our large section on social work and the separate section on applied, industrial and organizational psychology. But as Sara Strickhouser and I say in our article on the history of applied social research, "The history of 'applied social science' is indeed the history of the social sciences themselves" (Strickhouser and Wright, 2015). All of the social sciences in their modern form were birthed in the post-Enlightenment effort to understand why people, their institutions and society as a whole were as they were — why greed was more visible than generosity, why oppression was more common than freedom, why inequalities of various sorts characterized every social institution. To the founders of the disciplines, the modern distinction between basic and applied scientific concerns would have seemed meaningless, as indeed it was.

The Planning Phase and Editorial Structure

Elsevier's original acquisitions editor for this project, Scott Bentley, discussed the broad outlines of our attack on IESBS 2/e with me in a series of phone calls in the early months of 2010. By May 2010, certain of these outlines had come into sharp relief. There would be a single editor in chief with a tier of 'responsible lieutenants' to assist. These lieutenants started out as advisory editors but soon morphed into the 10 area editors in the final editorial structure. Each area editor would in turn oversee various sections and each section would have its own editor or editors. The original plan was that the area editors would each be responsible for approximately 400 articles and each section editor responsible for about 100 articles, so that no one would have an excessive amount of work compared to everyone else. In the end, however, some sections required more articles and others fewer, so the areas vary from fewer than 300 to more than 600 articles, and the sections vary from fewer than 30 articles to well more than 200.

Prior to my first discussions with Scott Bentley, Elsevier had commissioned about 20 'market surveys,' roughly half from professional librarians and the other half from academics, each focused on 'what was right and what was wrong' with the first edition. The most insistent demand that surfaced was for a fully electronic, computer-searchable work either in addition to or instead of a print version. In the end, both an e-version and a print version are being made available. But there were also consistent concerns expressed about spotty coverage of some areas: no coverage of social work to speak of; inadequate coverage of accounting, marketing, and business; no separate section of criminology; haphazard coverage of applied topics and concerns; and so on. And there were the predictable concerns about undue Western domination of the work.

Working from the 1/e Table of Contents and this stack of 20 surveys, I tinkered for a few months with how best to expand coverage to address the concerns our reviewers had expressed; the result was (more or less) the editorial structure shown elsewhere in the front matter of this work. Thus, the 53 sections of 2/e are basically the 39 sections of the first edition plus sections that were added to cover important emerging areas of research interest (e.g., gay, lesbian, bisexual, and transsexual studies) or to provide deeper coverage of disciplines and subdisciplines that the first edition treated lightly if at all (applied social and behavioral sciences, social work). A

few of the first edition sections were eliminated entirely: specifically, integrative concepts and issues (something of a catch-all category for 1/e articles that were highly interdisciplinary or simply did not fit anywhere else) and gender studies (gender is now so thoroughly integrated into the research and thinking of all the social and behavioral science disciplines and subdisciplines that a separate section was unnecessary and somewhat retrograde). Others were altered or expanded in significant ways (organizational and management studies, for example, became the second edition section on management, organizations, business, marketing and finance; expressive forms evolved into the 2/e section on culture and the arts; linguistics was subdivided into three separate sections; etc.) And some subdisciplinary areas that were part of other sections in the first edition were given their own sections in the second (life course studies; sexuality; criminology; labor studies; and war, peace, violence, and conflict are the most prominent examples), just to ensure adequate coverage.

The Introduction to 1/e (Smelser and Baltes, 2001) discusses at great length the intellectual architecture of the first edition and its evolution; the agonizing decisions about rules for the biographical articles; whether to organize the work by discipline, by concept, by an a priori taxonomy of social science knowledge, or in some other manner; and related structural matters. What resulted in 1/e was something of a hybrid model with some sections clearly representing specific disciplines, others representing 'overarching topics,' still others representing 'intersecting fields,' and so on. My task was far less challenging: I thought the architecture of the first edition served its purposes admirably and so I adopted it wholesale for the second edition, with the small modifications noted above.

While each of the 53 sections of 2/e has some more or less obvious justifying logic or substantive or disciplinary coherence, their arrangement into the 10 areas of the second edition does not. As already indicated, decisions about what sections to include and exclude were made very early in the development of the second edition, based on what was in the first edition, what Elsevier's marketing surveys suggested as significant lacunae, and my own sense of things. The arrangement of the sections into areas came later and was dictated largely by the interests and expertise of those who had been persuaded to sign onto the enterprise. Thus, all the Linguistics sections are in Area Five along with the cognitive and neuroscience sections because Harry Whitaker at Northern Michigan University had been a linguist first, a neuroscientist second, and a historian of psychology third. Likewise, Area Eight contains its seemingly chaotic hodgepodge of evolutionary sciences, genetics, religious studies, science and technology studies, and law because these happen to be the fields of interest of the redoubtable Barbara Prainsack of King's College, London, whose editorial talents are as deep as her interests are broad. Simplifying only slightly, section editors were chosen for their substantive expertise in particular areas of research (as well as their international or cultural 'range'); the plan was that section editors would review each of their articles for completeness of coverage, currency, fairness, and the like. In contrast, area editors were chosen for their breadth of interest and knowledge spanning multiple sections – people who by nature, experience, and training would be good at seeing the big picture. The role of the area editors was to assure that the articles were at least modestly international and interdisciplinary and formed some sort of coherent whole.

As laid out in an early e-mail to one of the area editors, "In my mind, Advisory [Area] Editors are generalists and Section Editors are content specialists. The Section Editors need to bring breadth of knowledge to their responsibilities, of course, but the primary job requirement is expert understanding of the particular field or section. We need section editors who can commission pieces that adequately review past developments in the subject area, but who can also shape their portfolios to identify major unanswered questions and new research developments." This was the general model followed throughout the recruitment process.

The approach just sketched inevitably left a residual area made of up sections that none of the other area editors were willing or able to claim. That proved to be Area Ten. A very large number of scholars from various disciplines and world regions were approached about serving as the Area Ten Editor. All demurred until I approached Martin Bulmer of the University of Surrey, who served the project for about a year but was unable to continue and subsequently left the Board. So for the final year of the project, the editing of Area Ten was done mainly by me.

The online subject classification for IESBS 1/e did not correspond precisely to the sections of the first edition; the subject classifications listed articles by broad general topic regardless of which 1/e section developed them. So for the first year or so, my assistants and I labored to assign every 1/e topic to one of the 53 2/e sections. With 53 sections to populate with articles and about 4000 articles to classify, the process of assigning articles to unique sections occupied huge amounts of time and generated endlessly complicated spreadsheets. (After about a year of this, a document surfaced in the Elsevier archives that showed exactly where each 1/e article had originated.)

Along with populating the 2/e sections with articles, searching for area and section editors occupied a major part of the early going. The original idea was to identify the 10 area editors first and then enlist them in the

search for their section editors, but in fact, these processes were simultaneous and were about half-completed when the two planning meetings were held: the first in San Diego on 19 and 20 May 2011; the second in London on 5–7 June 2011. Although not part of the plan, the first meeting was mostly attended by area editors and the second, by section editors.

The agenda for both meetings was largely identical: achieve clarity on the respective roles of the various editors; solicit advice on filling the unfilled editorial slots; get buy-in on the project *mantra* (internationalism, interdisciplinarity, inclusiveness!); explain the relationship between the first and second editions (e.g., that all 1/e authors would be offered the opportunity to update their articles); explain the process of assigning articles to sections; and the like. In almost all cases, consensus was quickly forthcoming.

The largest substantive change in the second edition is the treatment of psychology. (Whether measured by students, practitioners, professors or programs, psychology is the largest of the social and behavioral sciences.) In the first edition, the whole of psychology was contained within four large sections: clinical and applied psychology; developmental, social, personality, and motivational psychology; cognitive psychology and cognitive science; and behavioral and cognitive neuroscience. Cognitive science and neuroscience are, of course, rapidly growing sectors of the psychological discipline and it seemed appropriate to devote an entire area of the second edition to them. This area contained seven separate sections (three of them devoted to linguistics). And the 'softer' psychological sciences were placed in a separate area comprised of eight sections (including psychiatry and social work). These changes were made to assure that 2/e had adequate coverage of the entire psychological enterprise (a concern that was raised in some of the reviews of 1/e).

The structure of the editorial team was developed to serve two purposes: first, to divide up the labor into manageable parts; and secondly, to assure that every article in the final product would be reviewed by at least three scholars: the respective section editor, area editor, and the editor in chief. Since we were all aware of one another's identities throughout, the review process was not blinded, but every article in this work has been thoroughly peer-reviewed and vetted. In many cases, these articles have been through four, five, six, or even more revisions before being accepted for inclusion in the work.

Recruiting Editors and Authors

IESBS 2/e faced two different recruiting tasks: recruiting editors and recruiting authors. As indicated elsewhere, the original plan was that I would recruit area editors largely from my own personal networks and they in turn would recruit their section editors. In practice, the process was much more convoluted. First off, many of my 'first choice' candidates were hesitant to involve themselves in such a daunting and ambitious project. In some cases, an initial agreement to come aboard was followed a few weeks or months later by withdrawal as the true scope of work came into sharper focus. Some people that I tried to recruit as area editors demurred but agreed to serve as section editors; in other cases, candidates for area editors were nominated by section editors. In a couple of cases, there was a complete team of section editors prior to the successful recruitment of a corresponding area editor. And so on. The process of assembling an editorial team for the project was by no means linear.

Personal networks – mine and those of the people I persuaded to sign on – were the largest single source of ideas for other editors, by far. But personal networks tend to follow disciplinary and national lines and become rather quickly exhausted. In selecting both editors and authors, it was of course essential that all relevant perspectives be covered and that the breadth of fields was adequately represented. So other sources of ideas were tapped: the expertise of the Major Reference Works team at Elsevier; editorial boards of leading journals in the respective fields; Google Scholar citation counts; the knowledge and networks of people who had been involved in preparing the first edition – basically, anywhere names of top scholars in particular areas could be located. I did not keep systematic track of the number of people approached, much less of the outcomes; but in reviewing my e-mail archives from the early period of the project, I probably asked (on average) somewhere between six and eight prospects before I found someone to agree (an average that was highly variable across the areas and sections).

In the initial plan, area editors would recruit their own section editors and the section editors would in turn recruit their own authors, but the reality was again different. Inevitably, my negotiations with prospective editors (both types) would often result in a declination of the editorial role but an offer to write an article on a particular topic (or topics), offers I readily accepted. So in some cases, I had committed authors of particular articles well before I had the corresponding section or area editor in place. And many of the section editors likewise leaned on their area editors and on me for author suggestions, contacts, and outreach. So all the editors

were involved in locating willing authors (and not coincidentally, in making suggestions for articles to be included in the final work).

No one was asked to keep precise statistics on how many authors were sought before an agreeable author was found. My sense is that the 2/e editors had a somewhat tougher time with this than the 1/e editors had (but on the other hand, the 2/e editors had all the 1/e authors to work with, which Smelser and Baltes certainly did not have). The 1/e editors report that about 60% of those invited to write articles agreed to do so on the first 'ask' (with equivalent success rates in each subsequent 'ask'). In 2/e (or so I would guess), the success rate was probably closer to 50% and possibly even lower. They also report that something in excess of 90% of those who agreed to write for 1/e in fact contributed "acceptable entries in time to be included…" In the 2/e case, we found ourselves still soliciting authors within a few weeks of the submission deadline and some dozens of authors pulled out of the project at the last minute. Still, when all the dust settled, there were just about 800 articles planned for both editions that never materialized and both editions ended up with just fewer than 4000 articles. Perhaps these are 'natural limits' for a work of this sort.

Biographies*

In the Introduction to 1/e, Smelser and Baltes provided a short history of and rationale for the decision to include a limited number of biographical articles (150 of them, to be exact). This was evidently a controversial and contested decision since some of those associated with 1/e felt that biographical articles had no place in an encyclopedia focused on substantive knowledge (versus the personalities of those who produced it). As Newton said (paraphrasing a passage from Bernard of Chartres), "If I have seen further, it is by standing on the shoulders of giants" (a passage made famous among social scientists by Robert K. Merton's *On the Shoulders of Giants* (1965)). In other words, discovery is only possible because its discoverer is able to refer to knowledge already gathered and accumulated by his or her predecessors; and since all discoveries – small and large, substantial and minor – contribute to the production and accumulation of knowledge, singling out particular scholars for special attention would be both pointless and invidious.

This position, although understandable, was abandoned in the first edition and remains so in the second, largely because it is not possible to understand the social sciences without knowing the individuals who contributed to it. C. Wright Mills once defined the sociological imagination as the intersection of biography and history (Mills, 1959). To know the social sciences therefore requires biographical and historical knowledge. The social sciences are distinguished from the physical and biological sciences in the way they produce knowledge because individual human beings, including social scientists, invest meaning in their actions. Only through understanding the meaning that individuals give to their actions are social scientists able to provide explanations of human behavior and its outcomes. And what applies to social action in general applies to the production of social science knowledge as well. It thus makes sense to include biographical accounts of social science personages who have been particularly distinguished in making sense of human action and have in turn made major contributions to social science knowledge. To acknowledge individual social scientists with biographical articles is also to acknowledge their special and particular insights.

Once the decision was made to include biographies in 1/e, the next major decision was whom to include and whom to leave out. Two arbitrary but defensible principles governed these decisions: (1) the total number of biographies was not to exceed 150 (chosen because it seemed like a manageable number) and (2) only biographies of the dead would be included. The 1/e section editor for biographies, Karl Ulrich Mayer, consulted handbooks and encyclopedias, asked other section editors to name and rank the most important names in their respective disciplines, ran citation checks, and finally submitted a consolidated list to various experts for review. This resulted in some additions and some deletions and in the end 147 biographies made it into the first edition.

Instructions to authors writing these biographies directed them to include "a brief sketch of the major dates and events in the life of the biographee," to describe "the major contours of the [person's] substantive contribution," and to highlight the "importance and relevance of the biographee's work for the social and behavioral sciences." Largely the same instructions were given to 2/e biographers.

The selection criteria for 2/e were very different. First, on the reasoning that well-done biographies of leading figures is one of the things that draw readers to a work such as this, the total number of biographies was

* My thanks to Andreas Hess for drafting this section of the Introduction.

increased by more than 100 (to just over 250). In a major departure from 1/e, much of the increase is made up of biographies of the living. The 1/e restriction that excluded living persons resulted in anomalies that we thought needed to be addressed. As life expectancy has expanded in the twentieth and twenty-first centuries, so have the life spans of social scientists. Claude Levi-Strauss, to cite one obvious example, lived to the age of 101 years. When 1/e was published, he was in his 90s, was widely cited, was recognized universally as a modern classic, indeed a genius, of social anthropology – and yet, owing simply to his longevity, he was not included in the 1/e biographies. Biographies of, for example, the economist Herbert Simon, the political economist Albert O. Hirschman, the sociologist and philosopher Jürgen Habermas, and the linguist Noam Chomsky were all excluded for the same reason; indeed, Habermas and Chomsky still live as this is being written (Fall, 2014). In all these cases, the major works had been produced decades earlier, their major imprints on the social and behavioral sciences were already evident, their eventual inclusion in works such as this was inevitable. Are readers to be deprived of accounts of their lives, times, and contributions just because they have survived into deep old age?

Once the decision was made to include biographies of the living, however, it was not always easy to decide who among the living merited inclusion. Often the editors had to make decisions on a case-by-case basis, frequently in extended consultation with colleagues or experts in the field. Criteria used to make these decisions were whether the potential biographee had a reputation beyond one culture, nation, or language group; whether there was a record of sustained production over several decades; and whether there was an impact beyond the confines of a single discipline. These criteria reduced our list of suggested biographees considerably. Early lists of candidates numbered as many as 200 new names (in addition to the 147 biographies included in 1/e). In the end, as noted earlier, somewhat more than 100 new names were added.

In a few cases, persons were included that arguably did not satisfy our inclusion criteria. One such is Raul Hilberg, who became famous mainly for having written one very important book, *The Destruction of the European Jews* (1961). Hilberg's book is still regarded as the seminal work in Holocaust studies, a field of research that came to prominence much later; we felt that his signal contributions to Holocaust studies merited a biographical article. Much the same could be said, perhaps, of André Gorz, a well-known social theorist from France, and Albert Memmi, whose work is on colonialism, anticolonialism, and racism. These and other examples could and probably will raise questions about the porousness of our criteria. Whether we were right in giving 'trespassers' their space is open to debate. In any case, whether Hilberg, Gorz, Memmi, and others do or do not merit their biographies is for readers, not us, to decide.

Other important changes in the 2/e biographies section include, first, a conscious effort to attain a better gender balance, including more women both as biographees and as authors; and second, expanding the biographies both geographically and culturally. In the end we made some inroads in both respects but fell short of our internal goals. One of the main reasons for this is that any encyclopedia must, in the first instance, be true to the disciplines it represents. This means being true to the real status of important players, their networks and disciplinary power relations, and their academic capital in their respective fields and beyond. Change in these respects has been noticeable; certainly, the growth of the social sciences in Asia has been remarkable; and in most disciplines, the proportional presence of women has increased. But modest change in the right direction does not a revolution make. Too many nonwhite, non-Western, and nonmale practitioners are still being left out on the disciplinary peripheries and are not fully represented – not in their home disciplines and not in our encyclopedia either.

We state this fact with regret. In many cases, the limiting factor is not excellence but simple visibility. Being part of the trans-Atlantic social science dialogue and engaging this dialog mainly in English translates into more visibility, as discussed earlier. This gets a scholar on the radar screen. Equally excellent work engaging other intellectual dialogues in languages other than English does not. A great many outstanding scholars have thus gone unrecognized in 2/e for precisely this reason. That being said, strenuous efforts were made to make the 2/e biographies more inclusive. Among those included are the Argentinean educationalist Sarmiento, the Brazilian sociologist Cardoso, and the Japanese political scientist Maruyama, to name just a few. This is, however, 'just a few' of the many dozens of prominent social and behavioral scientists 'out there' whom we would have included had we been given more time and more resources (to get non-English works translated, for example). We do feel that we have made some important inroads and beg the reader's understanding of the limits within which we worked. We can only hope that the next edition will strive for more inclusiveness and better representation than we were able to achieve.

Another entirely new feature in the 2/e biographies is the series of 'collective biographies.' In many instances, the intellectual lives of individuals who work in research groups intersect and form a network that makes the

entire group (or paradigm) successful. Examples include articles on the Durkheimians, the Annales School, the Frankfurt School, and several others.

As indicated earlier, instructions to authors were changed little from 1/e. All authors were asked (1) to include the most important biographical facts (country of origin, generation, education, influences, other formative experiences, networks, etc.); (2) to list the most important output (discoveries, publications, etc.) and to briefly discuss the subject matter and content of the most important publications or discoveries; (3) to look at the lasting impact of the person and his or her work (if possible, beyond just one discipline, language group, or culture); and (4) to provide a bibliography of primary and secondary sources related to the biographee and his or her work. Most authors stuck to these guidelines.

Finally, we state for the record that there are a number of important social and behavioral scientists that we would have liked to include but for whom we were unable to find a proper biographer. The search for biographers went on for nearly 4 years. In many cases, our first-choice author agreed at once, but in other cases, we approached four, five, or even more people before an agreeable author was found. And in about two dozen cases, no such author was ever found, with the result that a deserving person's biography had to be dropped. Forgoing a case-by-case discussion of these deletions, let it be simply noted that this is why we have not included biographies of people such as Amartya Sen, the economist and social philosopher; Raymond Boudon, the French sociologist; Ronald Dworkin, the legal theorist; Avishai Margalit, the philosopher; or a collective article for the British Marxist historians (Eric Hobsbawm, E.P. Thompson, Christopher Hill, and Perry Anderson). Perhaps our most regrettable omission is Neil Smelser himself, for whom no biographer could be found despite at least a dozen attempts. (Paul Baltes's biography is included.) Neil is one of the giants on whose shoulders we all stand.

Redundancy

I mentioned earlier that in the beginning of the project, there was no 'map' linking each of the 1/e articles to its respective 1/e Section. Our efforts to create such a map invariably bogged down every time we hit an article that could plausibly belong to any of several sections, which was often. Obviously, it would have been possible to force every article into a 2/e section, but at the time it seemed advisable to involve the editors themselves in these decisions. So on numerous occasions, I distributed lists of 'orphaned' articles (articles for which no home had yet been designated) to the area and section editors, asking for foster parents to volunteer. Eventually, of course, every article found a home, but at a relatively late date in the process, I became aware that a few dozen articles had found more than one home. That is, some of the editors adopted articles without filing the appropriate paperwork with the editor in chief! In such cases, the result was two articles on the 'same' topic. (The 2/e Table of Contents was scoured multiple times looking for precisely these kinds of duplications but in the end, several proved elusive.)

In the large majority of cases, the content of the 'duplicate' articles was sufficiently distinct that both articles were retained, often with some retitling to help readers differentiate between them. For example, readers will find two articles on 'social identity.' One was recruited for the section on social psychology; the other for the sociology section. With rare exception, the two articles discuss different aspects of social identity from entirely different disciplinary angles; indeed, the two articles share only a small handful of common references. So it was an easy decision to retain them both: one appears here as Social Identity in Social Psychology; the other as Social Identity in Sociology. Careful readers will find perhaps a score of similar cases in the encyclopedia.

Alas, in a few regrettable cases, the overlap between duplicate articles was so pronounced that one of the articles had to be deleted. Since by the time these problems surfaced the articles had (often) been written and rewritten several times and had been accepted by both the section and area editors, the last-minute decision to delete a redundant article was painful. My sincere apologies to the authors involved.

Some redundancy in a work of this scope and aspiration is not only inevitable, it is probably also desirable. A reader interested in, say, social inequality will (one hopes) want to know what the sociologists, anthropologists, economists, and geographers all have to say about that topic. And if a few of the many articles on the topic say more or less the same thing, then what harm is done? Editors at all levels were asked to be alert to redundancies across articles and the editorial record shows that many were. That being said, quite a bit of topical redundancy no doubt remains, and that is not (in general) a matter of concern. It is what Smelser and Baltes refer to as the "inevitable residue of overlapping."

The Review Process

Once the table of contents had stabilized, each of the editors was asked to review the 1/e articles assigned to their section or area and come to various decisions. In some cases, 1/e articles could be reprinted more or less 'as is,' with perhaps some updating of references for readers seeking entry points into the current literature. This was especially the case with what were eventually designated as 'legacy articles,' e.g., Gabriel Almond's article on Civic Culture, James Gregor's article on Dictatorship, &c. In other cases, the 1/e articles needed some updating to be suitable for 2/e, either by their original authors when available or by others recruited specifically for the purpose. The general rule was that all 1/e authors would be offered the opportunity to do the updates themselves, and that other authors would be sought in the event of the original authors' declinations. In still other cases, the 1/e article was so obsolete than an entirely new article would be required. And then finally, the review of 1/e articles often revealed areas of current research that were inadequately covered; in these cases too, completely new articles would be sought.

Where appropriate, the relationship between the 1/e and 2/e versions of an article is spelled out in the article tagline. In many cases, there were issues of authorship to resolve — a 1/e article written by *X* and completely revised by *Y* is *Y*'s article although *X* might be identified in the tagline; but what of an article written by *X*, now deceased, and only modestly revised and updated by *Y*? Every decision rule that I formulated to resolve such issues soon confronted an exceptional case where the rule did not seem to apply. So in the end, the only workable rule was that everyone should get proper credit for their intellectual property, whether prime author or reviser, whether living or dead. If exceptions to this rule have crept into the final product (as they almost certainly have), I offer my apologies to those whose work has been slighted or improperly recognized. Deciding on proper authorship for many of our articles was a far more involved and difficult task than expected.

The section editors formed the first line of editorial defense and were the ones to whom article drafts were originally submitted. The section editors read and commented upon the draft articles and returned them to authors for revision. It is a rare article that appears here in its original form: on average, articles were revised two or three times before being sent to the area editors and subsequently on to me; in many cases, it was more like five or six revisions, with subsequent revisions at the request of the area editors and the editor in chief. And in some cases, articles were submitted to outside readers for independent review. As I stated earlier, the reviewing process was not blind, but it was quite thorough, as is reflected in the exceptional quality of the final product.

Internationalism and Inclusivity

A truly *International* Encyclopedia of the Social and Behavioral Sciences would of course require a global network of editors and authors *and* a commitment to internationalize the content of the work wherever possible. With respect to the editorial team for 2/e, this was definitely realized. The section editors and editors in chief who produced the first edition were drawn from only nine countries: The United States, Germany, Italy, Canada, Sweden, Australia, France, Switzerland, and the UK. Two-thirds of those editors were from the USA and only 13% were women. Area and section editors for 2/e represent 21 countries, US scholars make up only 38% of the total, and women comprise 36%. Thus, the proportional representation of women among the editors was nearly tripled in 2/e over 1/e while the predominance of the USA was halved. Nations represented among the editors of 2/e that were not represented in 1/e include Luxembourg, Greece, Finland, Japan, China, Ireland, Singapore, Spain, Russia, Austria, Israel, and the Netherlands. The presence of several Asian nations on this list is particularly gratifying. To be sure, the North Americans and Western Europeans still predominate, but they no longer monopolize the field.

Adding the International Board of Consulting Editors (see the following statement of Acknowledgments) increases the internationalism of the editorial team even further. Of the 45 members of that Board, only 12 (27%) are US social and behavioral scientists. Countries represented on that Board that are not otherwise part of the editorial team include three Central and South American nations (Venezuela, Argentina, Costa Rica), several Asian nations (the Philippines, Malaysia, South Korea, India), a few Western European nations (Norway, Denmark), two representatives from Central and Eastern Europe (Hungary, Croatia), two from the Middle East (Lebanon, Qatar), and one from South Africa. These editions bring to 35 the total number of countries with representation on the IESBS editorial team.

Much the same can be said of the 2/e authors, who are also more international than the 1/e authors had been. Smelser and Baltes noted in their Introduction that while authors from 51 nations were represented in the work,

58% of the authors were from North America and another 35% were from (mainly Western) Europe. "As to gender composition, 21% of the [1/e] authors were women." In 2/e, the proportion of women among the authors has increased slightly to approximately 25% and the percentage of North American authors has declined to fewer than half. Again, North America and Western Europe still contribute the larger share of the 2/e authors but the growing representation of social and behavioral science authors outside the West is both noteworthy and encouraging.

Another important point is that the international scope of the project is much more pronounced than editors' and authors' current affiliations would lead one to conclude. (This would have been equally true in 1/e as well.) Consider, for example, Michiru Nagatsu, author of our article 03053 on the history of behavioral economics. Dr Nagatsu was born in Japan and retains Japanese citizenship but was educated at Exeter and the London School of Economics and Political Science and wrote his IESBS 2/e article while on a postdoctoral fellowship in Finland. Or Guillermina Jasso, area editor for Area Three. Jasso was born in the USA, received her PhD from Johns Hopkins, and is on the faculty at New York University. By any standard, she would count as a US sociologist in our compilations. Yet her parents were Mexican of Basque, Spanish, Portuguese, and Dutch origins; Spanish is her native language; over the course of her distinguished career, she has published with coauthors from Germany, India, Israel, Mexico, the Netherlands, and Sweden; and she holds a permanent research fellowship at IZA, the Institute for the Study of Labor, in Bonn, Germany. Scoring her as 'USA' scarcely does justice to her biography or to the international perspective she brought to the editorial task.

What is true of author Nagatsu and editor Jasso is true in degrees of virtually the entire roster of IESBS participants. If one includes place of birth, citizenship, where educated, sites of research, visiting appointments, sites of fellowships, honorary professorships, invited lectures, and on through the list of highlights in a modern academic career, it is safe to say that every nook and cranny of the globe (save, possibly, Antarctica) is represented somewhere in the biographies of IESBS authors and editors. The true measure of internationalism, in short, is not so much where people come from or where they currently are, but rather the extent to which they bring a sensitivity and commitment to cultural and national differences into their work. Whether this was or was not realized in 2/e is for readers to decide.

Concluding Observations

Smelser and Baltes aspired in the first edition of this work to "assemble the whole range of knowledge – vast and complex as it is – of the social and behavioral sciences in one place." Since what does and does not qualify as 'social and behavioral science' is itself contested, it is not surprising that nearly every one of the market reviews commissioned by Elsevier to guide the development of the current edition noted content omissions in 1/e that reduced its usefulness and that needed to be addressed in a second edition. Critics can and no doubt will say the same about 2/e. I have already mentioned the nearly 800 articles that appeared on the 2/e Table of Contents at one time or another but that will not be found in the final product, either because agreeable authors could not be located or (less often) because agreeable authors never produced an acceptable article. And it is pretty easy to identify whole chunks of present-day social and behavioral science that are given short shrift, or no shrift at all, in this work – not because these chunks were judged to be unimportant but because limits of time, space, resources, and networks meant that some elements of the contemporary social science enterprise never came to our attention.

The social and behavioral sciences begin with what artificial intelligence guru Marvin Minsky once described as a "three pound computer made out of meat" – the human brain, which for all we know is the most complicated three-pound hunk of matter in the universe – and end with a thoroughly globalized culture and social structure that encompasses all aspects of our species' physical, biological, psychological, social, emotional, cultural, and spiritual lives. We are the most successful species ever to have inhabited the planet; we have colonized every inhabitable piece of dirt; our range extends everywhere; all the earth's resources lay at our command. To record all that has come to be known about human origins, evolution, language, culture, and social structure – everything we know about human emotions, identity, love, religion, family, economics, politics, domination, exploitation, and on through a very long list – would require orders of magnitude more volumes than the mere 26 volumes that comprise the present work.

We have come increasingly to the realization that what is social and human about our species is very intimately connected to our biological, genetic, and evolutionary inheritance. At the same time, the brain specifically and biological evolution more generally "cannot be viewed separately from the material, historical and

social circumstances that produce it" (Berntsen and Baker, 2015). As these authors put it, biology and culture are 'mutually constitutive.' Fifteen years ago, the editors of the first edition remarked on "ferment at the boundaries between the biological and the behavioral and social sciences." And while there are still important controversies, much of the ferment has yielded to cooperation as we are just now beginning to explore this endlessly complex web of interconnectedness between our biological and social selves. It is an easy and nearly inevitable conclusion, thus, that the third edition of the IESBS will contain a great deal more of the work being done at this intersection than 2/e was able to accommodate.

To conclude on a purely personal note, the 5 years I have spent working on this project produced many professional and personal gratifications, none quite so delicious as the certain knowledge that I would learn something new every single day. My work on 2/e exposed me to literature I never knew existed and to aspects of the social and behavioral sciences of which I was at best dimly aware. I can only hope that readers who come to these pages will find them as enriching as I have.

ACKNOWLEDGMENTS

A work of this scale is inevitably a communal enterprise involving many hundreds of editors, authors, reviewers, technical support people, colleagues, professional acquaintances, and friends who have provided input, advice, encouragement, and assistance over the past five years. Any listing is bound to be incomplete, so my apologies in advance to those who expected to be mentioned here but are not. Be assured that the slight is not intentional.

My negotiations with Elsevier about this project began early in 2010. By May of that year, I had committed to the project and have been working on it at varying levels of intensity ever since — often on weekends, during holidays, and whenever else I could snatch a useable chunk of time. So my first acknowledgment must be to my wife Chris for suffering through my five year obsession, always with understanding and affection, usually with good cheer. Chris is probably the only person in the world who is happier than I am that the project is now completed.

I must also acknowledge an enormous intellectual debt to the editors in chief of the first edition of the *International Encyclopedia of the Social and Behavioral Sciences*, Drs Neil Smelser and Paul Baltes (the latter now deceased). Dr Smelser was gracious enough to serve as Chair Emeritus of the project's International Board of Consulting Editors and to put himself at my disposal as, in his words, "a battle-scarred veteran." The basic intellectual structure of this work is adopted more or less wholesale from the Smelser—Baltes edition, with a few exceptions noted earlier in the *Introduction*. Without the original to serve as the starting point and blueprint, it is hard to imagine even embarking on such a task, much less bringing it to completion. Their edition was hailed as "the largest corpus of knowledge about the social and behavioral sciences in existence," which is to say that it formed an *extremely* solid foundation from which to build the work you now hold in your hands.

The first edition was organized into 39 sections overseen by a team of 53 section editors. The structure of the second edition is slightly different. It is divided up into 10 broad 'Areas,' each with an Area Editor overseeing the work of between four and eight Section Editors. In all, the second edition is thus comprised of the 10 Areas subdivided into 53 Sections; the 53 Sections were developed by a team of 76 Section Editors. So whereas Smelser and Baltes had 53 colleagues to help complete the work, I had 84 (two of the Area Editors also edited their own sections). On pages i-v in the front matter to this work one finds an Editorial Board list showing the Area Editors, Section Editors, Sections, names, and affiliations of the entire editorial team — a team whose dedication and effort in behalf of the project has vastly exceeded the rate of pay. A more helpful, productive, or delightful group of scholarly collaborators is difficult to imagine.

What readers see in the listed Editorial Structure of the work is the *final* editorial team as it existed when the work went into production. As would be expected in a project of this duration, there was considerable turnover within the team as the project developed and as death, competing demands, and general indifference all took their toll. I am grateful, nonetheless, to everyone who agreed, at least initially, to participate in the project, whether or not they were able to stay involved to the very end.

Susan Hanson (Geography) and Ulf Hannerz (Anthropology) are owed a special note of thanks because, of the 53 Section Editors involved in the first edition, these are the only two who agreed to reprise their roles in the second. (Both also wisely requested and received coeditors to carry part of the load.) Persuading people to serve who had no real idea what they were getting into was challenge enough, but these two suffered through 1/e and were willing to do it all over again for 2/e. And for that, I am especially grateful.

Many of the editors benefitted from the assistance of colleagues and graduate students at their various institutions. There was no mechanism built into the editorial process to keep systematic track of this

assistance and so the listing below is certain to be incomplete. But I can at least acknowledge those of whom I am aware who contributed time and intellectual energy to the effort: Liam Morton and Andrea Livingstone (Psychiatry); Jennifer O'Connor and Alana Dorris (Applied, Industrial and Organizational Psychology); Jen Hanis-Martin (Sexuality); David Budde, Annette Stimmer, Nikolas Ott, and Franziska Pfeifer (Institutions and Infrastructure of Social and Behavioral Sciences); Matthew LeDuc and Scott Freeman (Contemporary Cultural Concerns); and Simone Dudziak (Public Policy). To those named, my thanks. To those omitted, my apologies.

A special note of thanks to Dr Donald J. Barrett. Don was originally recruited to develop an entirely new section of the second edition on Gay, Lesbian, Bisexual, and Transsexual Studies, completed the section in short order, then e-mailed me to ask if there was anything further he could do to be helpful. Consequently, he took a major hand in developing the section on Biographies and was quite helpful with many other sections too. He appears in the Editorial Structure both as a Section Editor and as a Senior Editorial Associate to acknowledge his yeoman service to the entire enterprise. Also listed as a Senior Editorial Associate is my colleague Dr Amy M. Donley, who has been with the project since the very beginning and who, more than once, was all that stood between me and madness. I am proud to count them both as colleagues, collaborators, and friends.

I am also pleased to acknowledge Don Barrett, Andreas Hess, Harry Whitaker, John Berry, Barbara Miller, Scott Bentley, and Claire Byrne for their incisive and helpful commentary on previous drafts of the Acknowledgments and Editor's Introduction.

The project's International Board of Consulting Editors, chaired by Smelser and Dr Peter Marsden of Harvard University, was formed late in 2011 as a 'sounding board' to be used by the Area and Section Editors in searching for topics and authors and to help push for greater internationalism in our coverage. As it turned out, several members of this Board also stepped up to write entries in their areas of expertise. The composition of this Board and the affiliations of the consulting editors (as they were when the Board was first formed, not necessarily as they are today) are as follows: Neil J. Smelser, *University of California, USA*; Peter V. Marsden, *Harvard University, USA*; Ronald F. Abler, *International Geographical Union, USA*; John Bacon-Shone, *University of Hong Kong, China*; Roberto Briceño-León, *Universidad Central de Venezuela, Venezuela*; Roel Bosker, *Rijksuniversiteit Groningen, The Netherlands*; Michael Burawoy, *University of California, Berkeley, USA*; Nestor T. Castro, *University of the Philippines, Philippines*; Dalton Conley, *New York University, USA*; Freek Cronjé, *North West University, South Africa*; Scott Davies, *McMaster University, Canada*; Abdul Rahman Haji Embong, *Malaysian Social Science Association, Malaysia*; Joan-Maria Esteban, *Barcelona Graduate School of Economics, Spain*; Robert S. Feldman, *University of Massachusetts, USA*; Sari Hanafi, *American University of Beirut, Lebanon*; Gudmund Hernes, *Norwegian Business School, Norway*; Sheila Jasanoff, *Harvard University, USA*; Tim Jensen, *University of Southern Denmark, Denmark*; Colin Jones, *University of London, UK*; Nadezhda Lebedeva, *Higher School of Economics; and National Research University, Russia*; Miklós Lévay, *Eötvös Lorand University, Hungary*; Dinka Marinovic Jerolimov, *Institute for Social Research, Croatia*; Laurie M. Searching for an editorial team to represent every social science discipline and every region of the globe quickly exposed the deficiencies in my personal network, so I am indebted to a very large number of scholars around the world for calling names of prospects to my attention, allowing me to drop their names in the recruitment effort, or otherwise helping me find people with the expertise and commitment required for the job. In most cases, this is a list of people who were invited onto the editorial team in some capacity,

demurred, but made valuable suggestions about others to contact. In several cases, people are listed because they engaged me in intellectual discussions about the structure, format, and even advisability of this work, or simply replied to a cold-call e-mail in pleasant, kind, helpful, or informative ways. Again ignoring the risk of omission, my sincere personal thanks to those named below for their contributions large and small to the final product:

Doug Anderton, Juri Allik, George Armelagos, Susan Ayers, Amanda Baumle, Janeen Baxter, Jess ben-Habib, Joao Biehl, David Blanchflower, Hans-Peter Blossfeld, Jason Boardman, Dorret Boomsma, Roel Bosker, Henry Brady, Martin Bulmer, Craig Calhoun, Miguel Centeno, William Cockerham, Mark Nathan Cohen, Amelie Constant, Simon Cottle, Connie Citro, Eileen Crimmons, James Curran, Scott Davies, Donatella Della Porta, George Downs, Francis Dodoo, David Dozois, Sonja Drobnick, Jaap Dronkers, John Dryzek, Riley Dunlap, Lauren Edelman, David Elesh, Paula England, Nancy Eisenberg, Geoffrey Evans, Miriam Faust, Robert Feenstra, Marcus Feldman, Stanley Feldman, Ronald Fischer, James Fowler, Jeremy Freese, Angela D. Friederici, Michael Frumpkin, Masahisa Fujita, Nicole M. Gage, Nancy Gallini, Rosemary Gartner, Morton Ann Gernsbacher, Robert Goodin, John Grattan, Lance Gravlee, David Greenberg, Wendy Griswold, Melanie Guldi, Monica Das Gupta, Peter Hatemi, Robert Haveman, Karen Heimer, John Hibbing, Sarah Blaffer Hrdy, Sheila Jasanoff, Kelly Kadera, Cigdem Kagitcibasi, David Kavanaugh, Roger Keil, Byungkook Kim, Rob Kitchin, Jack Knight, Lyle Konigsberg, Candace Kruttschnitt, Helen Ladd, Phillip Lane, Graeme Lang, Janet Lauritsen, Ashley Leeds, Evelyn Lehrer, Richard Lerner, David Lewis, Tim Liao, Tom Linneman, Norman Long, Karen Lyons, Ruth Mace, Gary Marks, Herbert Marsh, Karl-Ulrich Mayer, Lorraine Mazerolle, Rose McDermott, Susan Michie, Harry Minas, Peter Miller, S. Phillip Morgan, Victor Nee, Vin-Kim Nguyen, Paul Nieuwbeerta, Helga Nowotny, Howard Nusbaum, Claus Offe, Thomas Ollendick, Joan Orme, Dennis O'Rourke, Michael Overington, Catherine Panter-Brick, Susan Parnell, Deborah M. Pearsall, Gerard Pfann, Jon Pierre, Mike Ping, Jennifer Platt, Ken Prewitt, Cathy Price, Jill Quadnagno, Charles Ragin, Thilo Rehren, Ben Rosamond, Bo Rothstein, Beth Rubin, Heinrich Sauer, Peer Scheepers, Ralf Schwarzer, Moshe Semyonov, Michael Shanahan, Sara Shostak, Alan Sica, Rainer K. Silbereisen, Beth Simmons, Catalina Smulovitz, Michael Sobel, Diane Stone, Jill Stephenson, Rafe Stolzenberg, Miron Straf, Richard Swedberg, Alan C. Swedlund, Sidney Tarrow, Jacques-Francoise Thisse, Stefan Timmermans, Florencia Torche, Erik Tsang, Judy Treas, Billie Turner, Cees van der Eijk, Paul van Lange, James Vaupel, Karin Wahl-Jorgensen, Mitchell G. Weiss, Neil Whitehead, Pamela Wilcox, Bjorn Wittrock, Cornelia Woll, Gisele Yasmeen, and Barbie Zelizer.

Gratitude is owed as well to the many colleagues at Elsevier who contributed to the production of this volume. My first debt is to Claire Byrne, the project's Content Project Manager and the head of the Major Reference Works (MRW) team that managed the day-to-day *Sturm und Drang* of the project: aggrieved, confused, or delinquent authors, missed deadlines, testy and intransigent editors, and the often-maddening work style of the Editor in Chief. I am sure there were days when Claire wanted to tear her hair out, but to external appearances, she was an island of calm in a sea of turmoil. She was also exceptionally good at her job.

Claire's MRW team comprised Richard Berryman, Will Bowden-Green, Esmond Collins, Mark Harper, Sam Mahfoudh, Mike Nicholls, Gemma Tomalin, Joanne Williams, and Marise Willis. No matter what issue or problem I faced, one of these fine, capable people was always available to step up with a solution, invariably offered in a spirit of cooperation and good cheer. They have been to IESBS 2/e what tech support is to the modern computerized office. Getting this work completed without their help is inconceivable.

Thanks also to the succession of Elsevier's Acquisitions Editors who managed the finances and internal politics of the project: to Scott Bentley, whose gentle suasions pulled me into the project in the beginning; to Karen Maloney and Peter Labella who ran the show in the middle period; and to Lisa Tickner who was in charge at the very end. These are the people on the front line in the endless war between the publisher, who wants things done now and at minimal expense, and the Editor in Chief, who was always asking for more time and more money. The many dozens of amicable compromises necessary to bring the project to completion were all ably negotiated by Scott, Karen, Peter, and Lisa, and for that, I am grateful indeed.

The University of Central Florida and its Department of Sociology have provided a congenial home for the project. My thanks in particular to Dean Michael Johnson; to the current and former chairs of my department, Jana L. Jasinski and Libby Mustaine; to my faculty colleagues Liz Grauerholz, Phillip 'Hutch' Pollock, Bruce Wilson, Melanie Guldi, Stacy Barber, Tosha Dupras, and John Schultz; and to current and former graduate students Thomas Hall, Sara Strickhouser, Betsy Swart, Jordana Navarro, Marie Gualtieri, Shannon Simone, and Shannon Frey.

And most of all, my sincere thanks to the many thousands of authors whose work this is. When comparing the quality of the work contained within these pages to the authors' honoraria, it is obvious that IESBS 2/e is an act of collective charity by our authors to the disciplines they represent. It is my pleasure to thank our authors on behalf of the global social science community.

James D. Wright
Orlando, Florida
January 2015

GUIDE TO USING THE ENCYCLOPEDIA

Structure of the Encyclopedia

The material in the Encyclopedia is arranged as a series of articles in alphabetical order.

There are four features to help you easily find the topic you are interested in an alphabetical contents list, cross-references to other relevant articles within each article, subject classification index, and a full subject index.

1. Alphabetical Contents List

The alphabetical contents list, which appears at the front of each volume, lists the articles in the order that they appear in that volume of the Encyclopedia. It includes both the volume number and the page number of each article.

2. Cross-references

All of the articles in the Encyclopedia have been cross-referenced. The cross-references, which appear at the end of an article as a See also list, serve three different functions:

a. To draw the reader's attention to related materials in other articles.
b. To indicate material that broadens and extends the scope of the article.
c. To indicate material that covers a topic in more depth.

3. Subject Classification Index

This index appears in Volume 26 and groups articles under subject headings that reflect the broad themes of Social and Behavioral Sciences. This index is useful for making quick connections between articles and locating the relevant article for a topic that is covered in more than one article. Under some section headings, you will find subheadings, if it is appropriate for the articles in a subject area to be grouped into more specific subareas.

4. Contributors

At the start of each volume, there is list of the authors who contributed to that volume.

5. Index

The index appears in Volume 26. The index includes page numbers for quick reference to the information you are looking for. The index articles differentiate between references to whole article, a part of an article, and a table or figure.

Abstract

Correspondence analysis (CA) is applicable to data in the form of rectangular tables, where the entries are nonnegative measures of association between the row and column entities. The primary example of a table suitable for CA is a cross-tabulation, or contingency table, although the method extends smoothly to the analysis of almost any table of nonnegative numbers measured on the same scale, where the relative values in each row and in each column are of interest. The results of CA are one or more sets of scale values for the rows and columns, values that have a geometric interpretation leading to visualizations of the similarities between rows and between columns, as well as the row–column associations. Important variants of CA are multiple correspondence analysis, applicable to multivariate respondent-level categorical data, and canonical correspondence analysis, where the CA solution is linearly constrained by external explanatory variables.

Historical Background

In the early 1960s, a dedicated group of French researchers, led by the extraordinary scientist and philosopher Jean-Paul Benzécri, developed methods for structuring and interpreting large sets of complex data. This group's method of choice was Correspondence analysis (CA), a method for transforming a rectangular table of data, usually frequency counts, into a visual map that displays rows and columns of the table with respect to continuous underlying dimensions.

Benzécri's contribution to data analysis in general and to CA in particular was not so much in the mathematical theory underlying the methodology, known for some time already, as in the strong attention paid to the graphical interpretation of the results and in the broad applicability of the methods to data in many contexts. His initial interest was in analyzing large sparse matrices of word counts in linguistics, but he soon realized the power of the method in fields as diverse as biology, archaeology, physics, and music. The fact that his approach paid so much attention to the visualization of data, to be interpreted and verbalized with ingenuity and insight into the substantive problem, fitted perfectly the *esprit géometrique* of the French and their tradition of visual abstraction and creativity. Originally working in Rennes in Western France, this group consolidated in Paris in the 1970s to become an influential and controversial movement in post-1968 France. In 1973, they published the two fundamental volumes of *L'Analyse des Données* (Data Analysis), the first on *La Classification*, that is, unsupervised classification or cluster analysis, and the second on *L'Analyse des Correspondances*, or CA (Benzécri, 1973). From 1976 until 1997 they published the journal *Les Cahiers de l'Analyse des Données* (available at www.numdam.org), which further reflected the depth and diversity of Benzécri's work. The first books in English explaining this approach to multivariate data analysis were by Lebart et al. (1984) and Greenacre (1984). For a more complete historical account of the origins of CA, see Greenacre (1984), Gifi (1990), and the first part of the book edited by Blasius and Greenacre (2014).

Correspondence Analysis

CA is a variant of principal component analysis (PCA) applicable to categorical data rather than interval-level measurement data (*see* Factor Analysis and Latent Variable Models in Personality Psychology). For example, **Table 1** is a contingency table obtained from the 2009 International Social Survey Program (ISSP) survey on social inequality (ISSP Research Group, 2012), tabulating responses from 41 countries on the question: 'What description describes the society in your country best?' (1) A small elite at the top, very few people in the middle, and the great mass of people at the bottom; (2) A society like a pyramid with a small elite at the top, more people in the middle, and the most at the bottom; (3) A pyramid except that just a few people are at the bottom; (4) A society with most people in the middle; (5) Many people near the top, and only a few near the bottom.

Of interest in CA are the *profiles* of the rows and columns of the table, defined as the relative frequencies in the rows (i.e., row entries divided by their respective row sums) and the relative frequencies in the columns (i.e., column entries divided by their respective row sums). For example, the profile of Argentina, which has row total (i.e., sample size) 1133, is $506/1133 = 0.447$, $400/1133 = 0.353$, etc., while that of Austria, with row total 1019, is $160/1019 = 0.157$, $243/1019 = 0.238$, etc. Similarly, the column profile of Type A, with column total 14 151, is $506/14\,151 = 0.0358$, $160/14\,151 = 0.0113$, etc.

The theory and computing algorithm of CA can be summarized by the following steps:

1. Let $\mathbf{N}$ be the $I \times J$ table with grand total n and let $\mathbf{P} = (1/n)\mathbf{N}$ be the *correspondence matrix*, with grand total equal to 1. If $\mathbf{N}$ is a contingency table, then $\mathbf{P}$ is an observed discrete bivariate distribution.
2. Let $\mathbf{r}$ and $\mathbf{c}$ be the vectors of row and column sums of $\mathbf{P}$, respectively, and $\mathbf{D}_r$ and $\mathbf{D}_c$ diagonal matrices with $\mathbf{r}$ and $\mathbf{c}$ on the diagonal. The elements of $\mathbf{r}$ and $\mathbf{c}$ are called row and column *masses*, and are also the average, or expected, column and row profiles, respectively. For example, $\mathbf{r}$ can be equivalently defined as the column sums divided by the

grand total: in this example, the mass of the first column (Type A) is $c_1 = 14\,151/54\,597 = 0.259$; hence Argentina has higher than average frequency of Type A, whereas Austria has lower than average, and so on for the other columns.

3. Compute the *singular value decomposition* (SVD) of the centered and normalized matrix, with general element $s_{ij} = (p_{ij} - r_i c_j)/\sqrt{r_i c_j}$:

$$\mathbf{S} = \mathbf{D}_r^{-1/2}\left(\mathbf{P} - \mathbf{r}\mathbf{c}^{\mathrm{T}}\right)\mathbf{D}_c^{-1/2} = \mathbf{U}\mathbf{D}_\sigma\mathbf{V}^{\mathrm{T}} \qquad [1]$$

where the left and right singular vectors are orthonormal: $\mathbf{U}^{\mathrm{T}}\mathbf{U} = \mathbf{V}^{\mathrm{T}}\mathbf{V} = \mathbf{I}$, and the singular values in the diagonal matrix $\mathbf{D}_\sigma$ are in descending order.

4. Compute the *standard coordinates* $\mathbf{X}$ and $\mathbf{Y}$ of the rows and columns:

$$\mathbf{X} = \mathbf{D}_r^{-1/2}\mathbf{U} \quad \mathbf{Y} = \mathbf{D}_c^{-1/2}\mathbf{V} \qquad [2]$$

and respective *principal coordinates* $\mathbf{F}$ and $\mathbf{G}$:

$$\mathbf{F} = \mathbf{D}_r^{-1/2}\mathbf{U}\mathbf{D}_\sigma = \mathbf{X}\mathbf{D}_\sigma \quad \mathbf{G} = \mathbf{D}_c^{-1/2}\mathbf{V}\mathbf{D}_\sigma = \mathbf{Y}\mathbf{D}_\sigma \qquad [3]$$

The respective row and column *contribution coordinates* are simply the matrices of left and right singular vectors $\mathbf{U}$ and $\mathbf{V}$, i.e., in terms of the standard coordinates:

$$\mathbf{U} = \mathbf{D}_r^{1/2}\mathbf{X} \quad \mathbf{V} = \mathbf{D}_c^{1/2}\mathbf{Y} \qquad [4]$$

The total variance, called *inertia*, is equal to the sum of squares of the matrix decomposed in [1]:

$$\text{inertia} = \sum_{i=1}^{I}\sum_{j=1}^{J}\frac{\left(p_{ij} - r_i c_j\right)^2}{r_i c_j} = \sum_{i=1}^{I}\sum_{j=1}^{J} r_i c_j\left(\frac{p_{ij}}{r_i c_j} - 1\right)^2 \qquad [5]$$

which is equal to 0.370 in this example. The inertia is identical to the Pearson chi-squar statistic calculated on the original table divided by n (*see* Multivariate Analysis: Discrete Variables (Overview)). The squared singular values $\sigma_1^2, \sigma_2^2, \cdots$, called the *principal inertias*, decompose the inertia into parts attributable to the respective principal axes, in descending order of importance, just as in PCA the total variance is decomposed along principal axes. In this example, the principal inertias have values (and percentages of the total) equal to 0.238 (64.4%), 0.0557 (15.0%), 0.0461 (12.5%), 0.0241 (6.5%), and 0.0060 (1.6%) – the number of principal inertias is one less than the number of rows or columns, whichever is smaller.

Apart from their several algebraic properties, the coordinates are used to represent the rows and columns in joint plots, where the interpretation differs depending on the choice of coordinates. The principal coordinates are the projections of the profiles onto principal axes that explain maximum inertia. These projected profile points are equivalently interpreted as approximating *chi-square distances* between the profiles, for example, between the profiles of rows i and i':

$$d(i, i') = \sqrt{\sum_{j=1}^{J}\frac{\left(\frac{p_{ij}}{r_i} - \frac{p_{i'j}}{r_{i'}}\right)^2}{c_j}} \qquad [6]$$

The total inertia of the table can then be written as the weighted average of the squared chi-square distances of the profiles to their average, or centroid, for example, for the row profiles:

$$\text{inertia} = \sum_{i=1}^{I} r_i[d(i, c)]^2 = \sum_{i=1}^{I} r_i \sum_{j=1}^{J}\frac{\left(\frac{p_{ij}}{r_i} - c_j\right)^2}{c_j}$$

The standard coordinates are convenient reference points for the interpretation, being the projections onto the principal axes of the unit profiles $[1 \quad 0 \quad 0 \quad \cdots \quad 0]$, $[0 \quad 1 \quad 0 \quad \cdots \quad 0]$, etc. The contribution coordinates, which are a rescaled version of the standard coordinates, are related to the contributions of each row or column to the principal axes (see below). When the substantive variable, in this case the column classification,

has few categories, one of the most popular displays is the *symmetric map*, where both rows and columns are displayed in principal coordinates, i.e., using the first two columns of **F** and **G** for the respective row and column coordinates in a two-dimensional display, as shown in Figure 1.

Types A to D form a curved pattern from left to right, with Latvia and Ukraine the most extreme on the left, i.e., the highest proportions of respondents saying their societies contain a small elite, few in the middle and most at the bottom. Denmark and Norway are at extreme right, i.e., the highest proportions saying their societies have most people in the middle and less at the extremes. Thus the horizontal position of the countries, accounting for almost two-thirds (64.4%) of the inertia, scales them in terms of how egalitarian the respondents view their societies, while the vertical position, accounting for 15%, contrasts Types B and C against the others. For example, France and the United States are near average (the center) horizontally, but for different reasons: 52.9% of French respondents opt for Type B (pyramid structure of society), while only 29.5% of US respondents do, the average across all countries being 32.9%. Not obvious from Figure 1 is that 24.2% of US respondents 'cannot choose,' whereas in France it is only 1.3% – the 'cannot choose' category dominates the third dimension of the CA, explaining an additional 12.5% of the inertia, which can be seen in the three-dimensional solution shown as a *video* in the online supplementary material.

Alternative choices of coordinates give slightly different interpretations of the results. In the *asymmetric map* of the rows, for example, also called the *row-principal biplot*, rows are shown in principal coordinates and columns in standard coordinates (vice versa for the column-principal biplot). The choice between a row-principal or column-principal biplot is governed by whether the original table is considered as a set of rows or a set of columns, when expressed in percentage form – usually, as in this example, the substantive categories are the columns, and the row-principal option would be the natural choice. Choosing contribution coordinates instead of standard coordinates in a row-principal biplot is a convenient alternative when there are many column categories, as is the case in community ecological applications, where samples (rows) are described by very many species (columns). The resultant *contribution biplot* shows the researcher exactly which columns are determinant for interpreting the differences between samples. Note that in CA the row and column profiles are weighted by their corresponding masses, which affect the solution as well as the interpretation – thus the low-frequency Type E category receives low weight in determining the optimal solution. In this example, the row (country) masses are proportional to the sample sizes, so that South Africa, for example, with a sample size of 3285, obtains three times the weight as Argentina. If it is preferred to give each country the same weight, this is achieved simply by transforming the table to row proportions, or row percentages, before applying the CA algorithm, to force all row totals to be the same while not affecting the row profiles.

CA can be equivalently considered a *bilinear model* for the observed frequencies, since the SVD in [1] may be written in terms of the standard coordinates in the following equivalent form, for the (i, j)-th element $p_{ij} = n_{ij}/n$ of the correspondence matrix:

$$p_{ij} = r_i c_j \left(1 + \sigma_1 x_{i1} y_{j1} + \sigma_2 x_{i2} y_{j2} + \cdots\right) \qquad [7]$$

(see Multivariate Analysis: Discrete Variables (Correspondence Models)). There are as many terms $\sigma_k x_{ik} y_{jk}$ in [7] as there are dimensions, the maximum number of dimensions. For a model with two dimensions, for example, retaining $k = 1$ and 2, the residual elements have been minimized by weighted least-squares.

Contributions to Inertia

The overall quality of the CA solution is judged by the percentages of inertia, similar to a regression analysis: for example, in Figure 1, 79.4% of the inertia (variance) is explained by the two-dimensional solution, and in the three-dimensional solution in the supplementary material an additional 12.5% is

Figure 1 Correspondence analysis of Table 1: two-dimensional symmetric map showing rows and columns in principal coordinates; 79.4% of the inertia explained.

explained, bringing the overall percentage to 91.9%, with only 8.1% unexplained inertia. More detailed diagnostics in CA can be obtained in the form of the so-called *contributions to inertia*, based on the decompositions of the total inertia in [5] according to individual rows or individual columns, dimension by dimension:

$$\sum_{i=1}^{I}\sum_{j=1}^{J}\frac{\left(p_{ij}-r_ic_j\right)^2}{r_ic_j}=\sum_{k=1}^{K}\sigma_k^2=\sum_{i=1}^{I}\sum_{k=1}^{K}r_if_{ik}^2=\sum_{j=1}^{J}\sum_{k=1}^{K}c_jg_{jk}^2 \quad [8]$$

For example, every column component $c_jg_{jk}^2$ can be expressed relative to the principal inertia $\sigma_k^2=\sum_j c_jg_{jk}^2$ of the corresponding dimension k. These relative values provide a diagnostic for deciding which columns (or in a similar way, which rows) are important in the determination of the kth principal axis. In fact, these relative values, summing to 1, are exactly the squared contribution coordinates defined previously. An alternative diagnostic is to express these elemental components $c_jg_{jk}^2$ relative to their sum over the dimensions, $\sum_k c_jg_{jk}^2$ which is just $g_{jk}^2/\sum_k g_{jk}^2$ – these values are analogous to the squared factor loadings in factor analysis, that is, squared correlations between the column category and the corresponding principal axis or factor (*see* Factor Analysis and Latent Variable Models in Personality Psychology). For the above application, these values for Type E are 0.108, 0.043, and 0.016 on dimensions 1–3, which means that only 0.166 (16.6%) of the variance of this column is explained by the first three dimensions, considered as 'predictors' of Type E. For the category 'cannot choose,' the respective values are 0.026, 0.046, and 0.918, showing that more than 90% of its variance is explained by dimension 3.

Extensions

CA is regularly applied to analyze multiway tables, tables of preferences, ratings, as well as measurement data on ratio- or interval-level scales. Such extensions of the method conform to Benzécri's conception of CA as a universal technique for exploring many different types of data through judicious transformations or coding.

Concatenated Tables

For multiway tables, there are two approaches. The first approach is to convert the table to a flat two-way table, which is appropriate to the problem at hand. Thus, if a third variable is introduced into the example above, say 'gender of respondent,' then an appropriate way to flatten the three-way table would be to interactively code 'country' and 'gender' as a new row variable, with $41 \times 2 = 82$ categories. The table for males is thus contented beneath the table for females. For each country there would now be a female and a male point and one could compare genders and countries in this richer map. This process of *interactive coding* of the variables can continue as long as the data do not become too fragmented into category combinations with very few counts. A less informative way of concatenating tables is to juxtapose several cross-tabulations of a set of row variables and a set of column variables into a supermatrix of tables. For example, given a set of demographic variables such as age, education, and marital status, and another set of substantive categorical variables, all cross-tabulations of variable pairs composed of a demographic and a substantive variable are stacked row- and column-wise, and the whole matrix of tables subjected to a CA. It should be remembered that only pairwise relationships are displayed in the eventual visualizations.

Multiple Correspondence Analysis

Another approach to multiway data, called *multiple correspondence analysis* – also called *homogeneity analysis* (Gifi, 1990; Greenacre, 2007: Chapter 18), applies when there are several categorical variables skirting the same issue, often called 'items.' In the same ISSP survey, for example, there are 11 questions concerning the issue of 'getting ahead,' from "How important is coming from a wealthy family" to "How important is being born a man or a woman," to which respondents have to respond on a five-point scale from 'Essential' to 'Not important at all.' MCA is usually defined as the CA algorithm applied to an indicator matrix $\mathbf{Z}$, with the rows being the respondents and the columns being dummy variables for each of the categories of all the variables. The data are zeros and ones, with the ones indicating the chosen categories for each respondent. The resultant map shows each category as a point and, in principle, the position of each respondent as well. Alternatively, one can set up what is called the *Burt matrix*, $\mathbf{B}=\mathbf{Z}^{\mathrm{T}}\mathbf{Z}$, the square symmetric table of all two-way cross-tabulations of the variables, including the cross-tabulations of each variable with itself. This matrix, named after the psychologist Sir Cyril Burt, is reminiscent of a covariance matrix and the CA of the Burt matrix can be likened to the PCA of a covariance matrix. The analysis of the indicator matrix $\mathbf{Z}$ and the Burt matrix $\mathbf{B}$ give identical standard coordinates of the category points, but slightly different scalings in the principal coordinates because the principal inertias of $\mathbf{B}$ are the squares of those of $\mathbf{Z}$. A variant of MCA called *joint correspondence analysis* (JCA) avoids the fitting of the tables on the diagonal of the Burt matrix, an approach that is analogous to least-squares factor analysis – see Greenacre (2007: Chapter 19). Notice that the Burt matrix is a concatenated matrix of pairwise relationships within a set of variables, whereas the concatenated matrix described at the end of Section Concatenated Tables contains pairwise relationships between two sets of variables.

Ratings, Rankings, and Paired Comparisons

As far as other types of data are concerned, namely rankings, ratings, paired comparisons, ratio-scale, and interval-scale measurements, the key idea is to recode the data in a form, which justifies the basic constructs of CA, namely profile, mass, and chi-squared distance. For example, in the analysis of rankings, or preferences, applying the CA algorithm to the original rankings of a set of objects by a sample of subjects is difficult to justify, because there is no reason why weight should be accorded to an object in proportion to its average ranking. A practice called *doubling* resolves the issue by adding either an 'anti-object' for each ranked object or an 'anti-subject' for each responding subject, in both cases with rankings in the reverse order – see Greenacre (2007: Chapter 23). This addition

of apparently redundant data leads to CA effectively performing different variants of PCA on the original rankings. The same idea can be applied to ratings data, for example five-point ordinal scales, usually coded 1–5. A rating of 2, for example, would be recoded as a pair of ratings with values 1 and 3, since there is one scale point on the scale to the left of the rating 2, and three scale points to the right of it. This doubled pair of variables would code opposite poles of the original scale, and the CA of the doubled table based on several rating scales is again quite similar to the PCA of the original undoubled table, the only difference being the normalization inherent in the chi-square distance.

Fuzzy Coding

There are several ways for CA to handle continuous data – one of the most versatile is to recode each continuous variable into a set of fuzzy categories. This is a generalization of the dummy variable coding of MCA, which has only zeros or ones, also called 'crisp coding.' Coding a variable into three categories such as 'low,' 'medium,' and 'high' leads to fuzzy-coded values such as $[0 \quad 0.23 \quad 0.77]$, where 0.77 indicates that the datum in question is 'mostly' in the high category but 'somewhat' in the middle category. This is a more accurate coding than crisply coding the datum as $[0 \quad 0 \quad 1]$. Fuzzy coding is achieved through the use of membership functions, which transform the original variable into a set of fuzzy categories, with the fuzzy values being nonnegative and summing to 1. Once the data have been recoded, CA is applied in the usual way – see Aşan and Greenacre (2011).

CA Can Perform MDS on a Distance Matrix

CA can also be shown to be a limiting case of multidimensional scaling (MDS), by applying it to an appropriately transformed square symmetric matrix of distances. The distances are squared and subtracted from a constant C, which is at least as large as the largest squared distance in the table (so the diagonal of the transformed matrix would consist of C's). The CA of this transformed matrix yields a solution, which, after an appropriate rescaling that depends on C, approximates the classical scaling solution of the distance matrix and tends to the exact solution as C is increased (Carroll et al., 1997).

Subset Correspondence Analysis

In some cases we would like to analyze certain subsets of rows or columns, for example, a specific set of response categories in survey research, that is, all the response categories excluding the 'missing' ones (refused to answer/not applicable/etc.). Because CA uses the table margins as weights, the simple use of a table with such categories simply omitted leads to problematic situations, which can be easily solved by maintaining the original margins of the full table whenever a subtable is analyzed – see Greenacre and Pardo (2006) and Greenacre (2007: Chapter 21).

Canonical Correspondence Analysis

CA finds the optimal dimensions of a data table, but in certain situations additional variables serving as explanatory variables are available. For example, in a social survey like the one described in Section Multiple Correspondence Analysis, the age, number of years of education, and marital status might be available for each respondent. The optimal CA dimensions can be regressed on the variables, to assess whether and how much the dimensions can be explained by these variables. A more specific analysis can be performed when the dimensions are forced to be related, usually linearly, to the explanatory variables. In other words, the researcher is only interested in the variance that can be explained by age, education, and marital status. This is achieved by first projecting the primary response data onto the space defined by the explanatory variables, and then performing the dimension reduction in this reduced space. In the CA context this is called *canonical correspondence analysis*, and is used extensively in ecology when biological community data, usually abundance counts of many species, are related to several environmental variables (ter Braak, 1986; Greenacre, 2007: Chapter 24).

The latest developments on the subject, including discussions of sampling properties of CA solutions and comprehensive reference lists, may be found in the volumes edited by Greenacre and Blasius (1994, 2008) and Blasius and Greenacre (1998, 2014).

Abstract

This article presents an overview of the basic principles and statistical foundations of correspondence analysis with a special emphasis on its historical and further developments. With respect to the social sciences, we concentrate on the work of Pierre Bourdieu and his scholars and their empirical construction of 'social spaces' and social fields.'

Introduction

Correspondence analysis (CA) is a multivariate method for analyzing categorical data, its main objective is to visualize rows and columns of a data table in a low-dimensional (usually two-dimensional) space, called *map*. CA was developed by Jean-Paul Benzécri and his collaborators in France in the 1960s. Together with multiple correspondence analysis (MCA), it is the central part of the French "Analyse des Données" (cf Benzecri et al., 1973; Greenacre, 1984, 2007; Lebart et al., 1984; Le Roux and Rouanet, 2004). In contrast to traditional statistical methods such as Ordinary Least Square (OLS) regression, CA, and MCA do not make any assumptions on the structure of data, they rather identify the structure of relations between the variables and between the objects (e.g., individuals), in survey research usually the individuals.

There is a particularly large number of applications of this method in the social sciences, the work of Pierre Bourdieu and his scholars is probably the best-known example. Whenever the discussion turns to 'social space,' the empirical foundation is usually based either on CA, or on MCA.

In this article we first discuss the basic principles of the methods, their historical development, and the underlying statistical background. In the next step we make CA accessible discussing examples of Pierre Bourdieu's work on *social spaces* and *fields*. In the final section 'Further Developments and Related Techniques' we discuss some recent developments of the method, and we conclude with a short discussion and outlook.

Principles of CA and MCA

The basic form of CA is to analyze a single ($I \times J$) cross-table (with $I =$ number of rows, $J =$ number of columns), with nonnegative entries. Using the two variables 'occupation groups' and 'education level,' input of CA could be the frequencies of the cells from the respective cross-table. The solution would be (1) a graphical display of row and column categories and (2) a numerical solution which provides, among other aspects, the correlations between manifest and latent variables, i.e., factor scores equivalent to the factor loadings, which are well known from principal component analysis (PCA).

In the example, the CA solution would allow studying the associations within the set of occupation groups with respect to education, the associations *within* the levels of education with respect to occupation and the relations between 'educational level' and 'occupation groups.' There are only a few real-life applications that are limited to only two variables, the main objective of CA (and MCA) is to visualize more complex structures of data. A simple extension of the given example is to add other variables by row- and/or column-wise concatenating of frequency tables, for example, age groups and party preferences.

To give an example, assume that we have eight social groups (g1 to g8), $N = 750$ respondents, 10 indicators on some kind of abilities (A1 to A10) with three categories each ("yes, I am able to do it" (yes), "yes, I am able to do it but just a bit" (jab), "no, I am not able to do it" (no)), the dimension of the respective matrix is 30×8.

CA and MCA allow to distinguish between *active* and *passive* (or *supplementary*) variables, While the *active* variables, for example, the 10 abilities mentioned above, are used to create the geometric orientation of the axes in the projection space, the *passive* variables do not have any influence on it, but they can be interpreted together with the *active* variables. In the given example the 10 abilities with a total of 30 variable categories are treated as *active*, leading to a *space of abilities*, some sociodemographic characteristics such as sex, marital status, age groups, and income groups can be added as *passive* variables, permitting for the joint representation together with the abilities. In this context of applying CA there is usually one variable to be described (here the eight groups) and one or more describing variables.

For reasons of simplification, we assume that there are no missing values in the data set. The structure of the respective matrix of input data is shown in Table 1.

The first 30 rows and the first eight columns (upper left block) contain the frequencies of the cross-tabulations between the 10 abilities (with categories 'yes,' 'jab,' and 'no') and the eight social groups. This 'active' part of the table will be used for constructing the space when applying CA. Since there are no missing data, the number of valid cases for each of the 10 abilities is the same: $n_{1+} + n_{2+} + n_{3+} = n_{4+} + n_{5+} + n_{6+} = \ldots = n_{28+} + n_{29+} + n_{30+} = N$.

In the French tradition of interpreting CA solutions, researchers usually use the so-called 'symmetric map' for visualizing the solution, which is the joint representation of row and column profiles. Thereby, the distances within the set of rows and within the set of columns are Euclidean ones, the distances between rows and columns are not defined; for

Table 1 Matrix of input data, stacked table, with supplementary rows and columns

		Active				*Passive*				
	Ability	*g1*	*g2*	…	*g8*	*1*	*2*	…	*750*	*Sum (g1–g8)*
Active	A1_yes	$n_{1,1}$	$n_{1,2}$	…	$n_{1,8}$	1	0	…	0	n_{1+}
	A1_jab	$n_{2,1}$	$n_{2,2}$	…	$n_{2,8}$	0	0	…	0	n_{2+}
	A1_no	$n_{3,1}$	$n_{3,2}$	…	$n_{3,8}$	0	1	…	1	n_{3+}
	A2_yes	$n_{4,1}$	$n_{4,2}$	…	$n_{4,8}$	0	0	…	1	n_{4+}
	A2_jab	$n_{5,1}$	$n_{5,2}$	…	$n_{5,8}$	1	0	…	0	n_{5+}
	A2_no	$n_{6,1}$	$n_{6,2}$	…	$n_{6,8}$	0	1	…	0	n_{6+}
	…	…	…	…	…	…	…	…	…	…
	A10_yes	$n_{28,1}$	$n_{28,2}$	…	$n_{28,8}$	0	0	…	1	n_{28+}
	A10_jab	$n_{29,1}$	$n_{29,2}$	…	$n_{29,8}$	1	0	…	0	n_{29+}
	A10_no	$n_{30,1}$	$n_{30,2}$	…	$n_{30,8}$	0	1	…	0	n_{30+}
Passive	Male	$n_{81,1}$	$n_{81,2}$	…	$n_{81,8}$	1	0	…	1	$(n_{(m+)})$
	Female	$n_{83,1}$	$n_{83,2}$	…	$n_{83,8}$	0	1	…	0	$(n_{(f+)})$
	Single	$n_{83,1}$	$n_{83,2}$	…	$n_{83,8}$	0	0	…	0	$(n_{(s+)})$
	…	…	…	…	…	…	…	…	…	$(n_{(\ldots+)})$
	Sum	10 × g1	10 × g2	…	10 × g8	(10)	(10)	(10)	(10)	10 × *N*

further details we refer to Greenacre (1984, 2007). To avoid this possible misinterpretation, rows and columns can be displayed in separate maps.

In case CA is applied to an indicator matrix (=MCA), the columns contain the variable categories (active as well as passive), and the rows enclose the objects (e.g., individuals). The cells of this matrix consist of 'ones,' which are used for the true options, and 'zeros,' which are used for the false ones. In the given example with 10 abilities containing three categories each, for each ability the ones indicate if a respondent is able to perform it (yes), if he/she is somewhat able (just a bit), or if he/she is not able to do it (no). With respect to passive variables the 'ones' indicate, among other things, if a respondent is a male or a female, if he/she is single, married, divorced, or widowed. It is evident that every variable has only one true possibility, all others are false. For example, a respondent either has a specific ability, or he/she has 'just a bit' of this ability, or not. Furthermore, a person can be either a male or a female but not both or none of them – and if there would be a third and meaningful category of gender, one could easily add another category.

The new example contains of $N = 750$ cases, the matrix to be analyzed has the dimension 750 × 30. When starting the work on CA and especially on MCA, the decomposition of such a large matrix was a sophisticated computational problem (Benzécri, 2006), so there would have been a simple reason to restrict the problem to a 30 × 8 matrix. Meanwhile processing time and storage capacity have undergone substantial improvements; nowadays every standard PC with standard statistical software is able to decompose a 750 × 30 matrix in a few seconds. In other words, today there are no computational limitations for social science applications in the field of MCA. However, as it applies to all statistical approaches, it is meaningless to include as many variables as one may like to consider, one should have a substantive theory (or a frame model, Le Roux and Rouanet, 2010, p. 10), which guides the process of data analysis. The example of the indicator matrix discussed above is given in Table 2.

Table 2 Indicator matrix, with supplementary columns

	Active (abilities)										*Passive (sociodemographic characteristics)*				
	A1			*A2*			…	*A10*			*Sex*		…		
I	*Yes*	*Jab*	*No*	*Yes*	*Jab*	*No*	…	*Yes*	*Jab*	*No*	*m*	*f*	*sin*	…	*Sum*
1	1	0	0	0	1	0	…	0	1	0	1	0	0	…	10
2	0	0	1	0	0	1	…	0	0	1	0	1	0	…	10
3	1	0	0	1	0	0	…	1	0	0	1	0	1	…	10
4	0	1	0	0	1	0	…	0	1	0	0	1	0	…	10
…	…	…	…	…	…	…	…	…	…	…	…	…	…	…	10
750	0	0	1	0	0	0	…	1	0	0	1	0	0	…	10
Sum	n_{1+}	n_{2+}	n_{3+}	n_{4+}	n_{5+}	n_{6+}	$n_{\ldots+}$	n_{28+}	n_{29+}	n_{30+}	$n_{(m+)}$	$n_{(f+)}$	$n_{(s+)}$	$n_{(\ldots+)}$	7500

Table 2 contains 10 abilities with three categories each ('yes,' 'jab,' and 'no'), and a set of supplementary variables, the first one is 'sex' with two categories, the second is 'family status.' In total there are Q (=10) active variables with a total of $J = 30$ categories and $N = 750$ individuals. The first person is male and at least not single, he mentioned that he possesses the first ability, for the second and the 10th ability he marked 'just a bit.' The second person is female, she exhibits none of the three abilities displayed in Table 2, the third person is male and single, he stated to have all three abilities. The first category (first ability, response category 'yes') has been mentioned n_{1+} times, the second category (first ability, response category 'jab') has been mentioned n_{2+} times, and so on. Since there are no missing values in Table 2, it yields: $n_{1+} + n_{2+} + n_{3+} = n_{4+} + n_{5+} + n_{6+} = \ldots = n_{28+} + n_{29+} + n_{30+} = 750$, and since there are 10 active variables, *total N* is 7500.

When applying MCA to the indicator matrix, both individuals and variable categories can be visualized in a map that can be read off like a geographic map. High positive associations between variable categories (as well as between individuals) are reflected by short distances, high negative associations by large distances. In general, the closer two categories (or two individuals) are located to each other in the projection space, the more similar they are. Note again, the distances between individuals and variable categories are not defined.

Methodological Background

Although there is a numerical representation of CA and MCA similar to PCA, the focus of interpretation in CA is traditionally based on the graphical solution that allows detecting the relationships between the variables (variable categories) of interest in a straightforward way, for example, between a set of lifestyle attributes and sociodemographic characteristics. In contrast to PCA, there is no requirement for the CA at the scale level of the data, they are typically ordered or unordered categorical.

Whereas CA is applied to a single contingency table or to a stacked table, MCA uses the same algorithm to an indicator matrix or a Burt matrix. Applying the CA algorithm to the indicator matrix ($\mathbf{Z}$), the table of input data has as many rows as cases in the data set, and the number of columns is equal to the sum of variable categories over all indicators included in the model. Thereby, a '1' indicates that the respondent chose a specific response category while a '0' indicates that he/she did not choose the specific response category. If there are no missing values in the data or if nonsubstantive responses such as "I don't know" are treated as valid responses or if listwise deletion has been applied to the variables included in the model, the row sums are equal to the number of variables while the column sums reflect the marginal of the variables.

Instead of using the indicator matrix as input to MCA it is also possible to apply the Burt matrix ($\mathbf{B}$). This matrix can be computed by multiplying the transposed indicator matrix by itself, i.e., $\mathbf{B} = \mathbf{Z}^{\mathrm{T}}\mathbf{Z}$. Alternatively, $\mathbf{B}$ can be generated by cross-tabulating all variables by all variables, including the cross-tabulations of the variables by themselves, and creating a row- and column-wise stacked table. $\mathbf{B}$ is a symmetric matrix in which the main diagonal elements contain the marginal of the respective variables, while all other elements of the main diagonal matrices are zero. The off-diagonal matrices contain the frequencies of the cross-tabulations between the respective variables. The numerical solutions of the columns from $\mathbf{Z}$ (=MCA solutions) can be converted to those of $\mathbf{B}$ by simple rescaling, the squared eigenvalues of $\mathbf{Z}$ are equal to those of $\mathbf{B}$. As it is true for PCA, MCA contains all first order interaction effects, the method can be seen as a generalization of PCA applied to unordered (or ordered) categorical data (Greenacre, 1984). The algorithm is given in Blasius and Greenacre (1994) and in Nenadić and Greenacre (2006).

Principal Investors and Early Work

CA can be traced back to the early twentieth century, especially to the works of Karl Pearson, Hermann Otto Hirschfeld (probably better known under his anglicized name H.O. Hartley), and R.A. Fisher; all three were interested in conceptualizing the association between categorical variables (Greenacre, 1984; Beh and Lombardo, 2012; Lebart and Saporta, 2014). Going back to the early beginning, Pearson (1906) already searched for 'optimal scores' that he could assign to the rows and columns of a contingency table that linearize regressions. Almost 30 years later, Hirschfeld (1935) could show for the two variable cases with I and J categories that $\min(I, J) - 1$ solutions exist for the problem mentioned by Pearson. The respective scores he found via an eigen equation are nothing more than the row and column coordinates in CA up to some standardization (Lebart and Saporta, 2014). Further, he could show that the sum of eigenvalues is equal to the well-known chi-square coefficient for two-way contingency tables divided by the total of the table, a value that is called *total inertia* in the CA framework. Some years later, Fisher (1940) obtained CA while generalizing discriminant analysis to a single categorical predictor (for more details see Lebart and Saporta, 2014).

A similar development for describing the association between continuous variables is the case of PCA, which can be traced back to Hotelling (1933) who was searching for principal axes of a multivariate normal distribution in a set of metric data. Guttman (1941) is usually mentioned as the first author on MCA, since his paper contains all the formulas that characterize MCA (cf Greenacre, 1984; Lebart and Saporta, 2014). In this framework, MCA can be understood as PCA applied to categorical data.

A different statistical approach was introduced in the late 1970s by a group of statisticians from the University of Leiden (Gifi, 1981, 1990). What they called *homogeneity analysis* (and what is implemented in SPSS), is the same as MCA. Thereby homogeneity analysis belongs to a set of scaling techniques applied to metric, ordered, and unordered categorical variables (for the historical background and some methodological details, see De Leeuw, 2014).

Pierre Bourdieu's Use of CA and MCA

In statistics, outside of France the discussion started with the textbooks by Greenacre (1984) and Lebart et al. (1984), in the

social sciences with the translation of Bourdieu's *La Distinction* (1979, in English, 1984). Thereby, visualizing data structures via CA and MCA reflects a way of thinking that is typical for the social sciences in France, which are especially associated with the name of Pierre Bourdieu. Many statisticians who worked in France in the 1970s and 1980s and published mainly in French – among others Ludovic Lebart, Brigitte Le Roux, and Henry Rouanet – were closely associated with Pierre Bourdieu and his work (Blasius and Schmitz, 2014).

The philosophy behind CA and MCA, from both the statistical and the social space point of view, can be expressed with the *second principle of data analysis* from Jean-Paul Benzécri, who pointed out that "The model should follow the data, not the inverse" (Blasius and Greenacre, 2006, p. 6). Instead of limiting the data to restrictive and subjectively formulated statistical models, they discussed relational structures in the data, following Benzécri's *first principle of data analysis* "statistics is not probability" (Greenacre, 1984, p. 10).

Bourdieu's methodology consisted in the identification of *social fields*, which are parts of the *social space*, and relationships within and between these fields. Although he was opposed to a rigid methodological fetishism, his empirical research was based on the relational construction of *social fields* and *social spaces* (Rouanet et al., 2000; Blasius and Schmitz, 2014). His research can be seen as a methodological alternative to the practice of statistical modeling – instead of carrying strong assumptions such as linear constraints on the data, he visualized and interpreted the nonlinear structure of the data. His research was guided by the following questions: (1) Does the distribution of various indicators follow a certain pattern? (2) Is there an empirical structure of positions and relationships that accommodate all objects/individuals in the data set? (3) Are there any empirically observable practices (statements, classifications, self-presentations, etc.) that correspond to the positions of the individuals in the *social space* or in parts of them? (4) How can the dynamics of the objects (individuals) and the respective classes be described? In his *social space* approach, Bourdieu usually used the lifestyle attributes as active variables, and the sociodemographic characteristics as passive ones; the latter ones were used to corroborate the interpretation of the axes estimated on the basis of the lifestyle indicators.

In *La Distinction* (Bourdieu, 1979, in English 1984) and in *Anatomie du Goût* (Bourdieu and de Saint Martin, 1976), the *social space* was constructed on the basis of the row-wise stacked frequency tables of 'occupational groups' (the column variable) times a set of (active) dichotomized lifestyle attributes as well as (passive) sociodemographic characteristics (the row variables). The first two dimensions of the solution can be interpreted as in traditional factor analytic approaches; Bourdieu (1979) labeled them *composition of economic and cultural capital* and *capital volume*. When rotating the axes by 45°, the new dimensions are called *economic capital* and *cultural capital* (for more details see Blasius and Friedrichs, 2008). By definition, 'income' (in groups) should be positively associated with *economic capital*, and the 'level of education' with *cultural capital*. Furthermore, both variables should be positively related to *capital volume*. In this approach the positions of single individuals are not directly available, since the input data contain the frequencies of the cross-tabulations between the respective variables. If one would like to include the individuals in this solution, one could add the information of each respondent as supplementary information by adding them as column variables. Bourdieu (1979, 1984) did not explain how he computed the geometric figures that cover the 'occupations,' it could be that these visualizations are approximations from the results that he obtained when he included the individuals as passive indicators.

In *Homo Academicus*, (Bourdieu, 1984, in English 1988) and in *La Patronat* (Bourdieu and Saint-Martin, 1978) Bourdieu applied MCA. In this case the columns contain the variable categories, and the rows include the single individuals. In this application he distinguished professors by their disciplines, faculty memberships, and sociodemographic characteristics within the academic field. The cells of the input data table contain 'ones' and 'zeros' only; thereby, the 'ones' are used for the true options and the 'zeros' for the false options. For example, in case of faculty membership, the ones reflect the existing membership(s), and the 'zeros' reflect the nonexisting memberships. This is the case of MCA where Bourdieu analyzed the data on the individual level instead of the aggregate level as he did in *La Distinction*.

Further Developments and Related Techniques

For more than 25 years, CA and MCA have been important methods in the social sciences, and they have been increasingly used over time (Beh and Lombardo, 2012). However, some parts of the techniques and some further developments are rarely used in the framework of *Analyse des Données*. In the following we briefly outline some helpful techniques inherent to CA and MCA as well as techniques that complement them.

First, as it has been mentioned before, *passive variables* can be represented in the projection space previously constructed with *active variables*, and jointly interpreted with them without influencing the geometric orientation of the axes. This is of particular interest for all situations where (the interrelations of) some variables are theoretically interpreted as the reference system for variables, which are treated as functions of the geometric space. Bourdieu and his scholars used this technique to illustrate their argument of the correspondence between sociodemographic characteristics and lifestyles.

Second, a widespread task in statistical analysis is the classification of objects into categories. Although the factor scores of MCA solutions can be used as input for clustering techniques (Lebart, 1994), this is seldom used. As a kind of *heuristic clustering*, Bourdieu (1979, 1984), for example, highlighted social classes in his *social space* by simply adding circles and rectangles without statistical justification. Apart from a subsequent clustering of factor scores (Lebart, 1994), it is also possible to derive and map *concentration ellipses* (Le Roux and Rouanet, 2010, p. 69; Rouanet, 2006, p. 146). Concentration ellipses are geometrical representations of the concentration around the mean points of a priori specified subclouds (such as the concentration around the two centroids of gender). This technique is useful when a certain variable is assigned causal primacy and is thus interpreted as a 'structuring factor' (Rouanet, 2006; Le Roux and Rouanet, 2010). In contrast to the *space of individuals* (objects), concentration ellipses facilitate

a differentiating inspection of the particular spatial distribution for all categories of a theoretically relevant variable.

Third, there are good reasons that one might be interested only in a subset of the data, for example, one is interested in the valid responses only. A typical technique is to apply listwise deletion, which has the disadvantage that one may lose many cases and that the remaining sample is biased. In the CA/MCA framework one also could add the missing responses as valid categories since the method deals with categorical data. The disadvantage of this possibility is that the missing cases are usually highly intercorrelated, which has the effect that the first dimension might just reflect *substantive versus nonsubstantive responses*, which is of little relevance in substantive research. An alternative is to apply *subset MCA* (Greenacre and Pardo, 2006; Greenacre, 2007; Blasius and Thiessen, 2012), which allows to exclude the 'not interesting' parts of information without influencing the remaining structure of data. Subset MCA also allows to concentrate on parts of the data, for example, on the 'fully agree' responses in a set of ordered categorical variables.

Fourth, traditional statistical tests of significance are seldom discussed and almost never applied in practical applications of CA and MCA (at least outside of France). Thus, CA and MCA are sometimes criticized because of their purportedly explorative nature and their lack of statistical significance procedures. However, there are several possibilities that can make CA, MCA, and related techniques more attractive for researchers from the world of 'traditional statistical' modeling and inference. Among other developments, *confidence ellipses* indicate the certainty of the *true* position of a variable category by specifying an area around the mean point (see Le Roux and Rouanet, 2010). Similar to the logic of parameter variance in classical inference statistic, the size of the ellipse expresses the statistical (un)certainty of the mean point's position. This approach can be used for distinguishing significant from nonsignificant category positions as well as for discussing the statistical relevance of two distances between points (see also Le Roux, 2014).

For more than 20 years, it has been possible to perform CA and MCA with all major statistical software packages such as Stata, SPSS, and SAS. Furthermore, in R there are specialized software solutions for CA, allowing to apply the advanced techniques mentioned above, for example, the packages CA (Nenadić and Greenacre, 2006) and FactoMineR (Lê et al., 2008).

Conclusion

As Beh and Lombardo (2012, p. 137) state "Over the past half a century correspondence analysis has grown from a little known statistical technique designed to graphically depict the association structure of categorical variables that form a contingency table to a very popular tool used in a wide variety of disciplines."

The main advantage of CA is that it can handle categorical data, ordered as well as unordered ones. As discussed, the only restriction is that CA and MCA can handle nonnegative data only. Since there are no negative values in survey research, there is no methodologically induced limitation in using these methods. However, although CA and MCA are explorative methods, one always should have a substantive theory about the structure of the variables to be included in the model. Bourdieu and his scholars, for example, use the idea of *social spaces* and *social fields* to relate social groups, e.g., occupational groups, to lifestyle indicators and sociodemographic characteristics. The axes (dimensions or factors) of their *social spaces* are often called 'composition of economic and cultural capital' and 'capital volume,' or 'cultural capital' and 'economic capital.' This is very similar to what is well known from PCA and factor analysis.

A particular advantage of these methods is the possibility of visualizing the dimensional structure of data and to read them off like a geographic map. In a geographic map it is very easy to catch which cities are close to each other, which are far away from each other, and how they are related by distance to each other. The same holds when reading a CA or MCA map, it is easy to catch the relations between a large set of variable (categories) and between a large number of individuals. Reading off the structure of the data also can help to see methodologically induced similarities, for example, all kinds of response sets (Blasius and Thiessen, 2012). There are many other techniques closely related to CA and MCA, for example, the *biplot methodology* and *multiple factor analysis*; an overview of these techniques can be found in the readers by Greenacre and Blasius (2006) and by Blasius and Greenacre (2014).

This article is a revision of the previous edition article by Y. Mény, L. de Sousa, Volume 4, pp. 2824–2830, © 2001, Elsevier Ltd.

Abstract

The interest of social science, media, and policymakers for corruption has exploded after 1990 due to increasing evidence that corruption is accountable for poor growth and chronic underdevelopment. This had impressive policy consequences: by 2012, no less than 161 state parties had adopted the United Nations Convention against Corruption (UNCAC), which was put into force on 14 December 2005. This article discusses the various conceptualizations of corruption as an individual behavior as well as a governance regime (particularism), the evolution of Western thought until the adoption of ethical universalism as universal governance norm (with UNCAC) and the performance of countries in establishing control of corruption in historical and contemporary times.

Etymology and Definition

Every language knows the word corruption, but its definition is ambiguous in all of them, so most have developed a whole set of words to back it up with more concrete terms. Corruption is departure from what should be (the norm) in ethics, morality, tradition, law, and civic virtue and it was used in all such contexts; by mid-fourteenth century, Europeans used it in parallel to indicate decay of material things, especially dead bodies, but also spiritual things, such as soul and morals. Its ambiguity derives from the relativity of norms across cultures, historical times, and position of social groups and individuals in various such contexts. The use of the term 'corruption' in relation to public office dates from the early fifteenth century in Europe. The Romans, however, knew already the essentials of corruption, in Latin *corruptionem* (nom. *corruptio*). One has as proof two excellent maxims that have survived to this day: 'The corruption of the best is the worst' (*corruptio optimi pessima*) and Terence's line "The most corrupt state has the most laws" (*corruptisima re publica plurimae leges*).

Although historians of government have always devoted attention to corruption, its rise to prominence in the attention of social scientists is of recent date. The last 20 years have produced over 16 000 entries on Google Scholar with 'corruption' in the title, while the previous 20 return only a modest 1740. (Search run on 8 April 2012.) This exponential growth is shown in the tracing over the last two decades of the Internet, the last 10 years returning nearly four times more articles than the previous 10. The explanation is obvious when considering that the most quoted paper in the lot (available from http://qje.oxfordjournals.org/content/110/3/681.abstract) is 'Corruption and Growth,' by economist Paulo Mauro from International Monetary Fund. This association between corruption and growth raised the interest of social science, media, and policymakers to the current heights. By 2012, no less than 161 state parties had ratified the United Nations Convention against Corruption (UNCAC), which was put into force on 14 December 2005. In articles 7 (public sector) and 9 (procurement), the treaty spells out the modern principles of efficiency, transparency, merit, equity, and objectivity as the only accepted governance norms. It also goes far beyond the criminalization of bribing or influence trading, stating in article 1.c that it will "promote integrity, accountability and proper management of public affairs and public property." In other words, UNCAC sets universal benchmarks of good governance.

Governance can be defined as *the set of formal and informal rules determining who gets what in a given polity*. (Developed from the definition of politics according to Laswell (1951) and the definition of governance by World Bank (Huther and Shah, 2000).) A *governance regime is any* stable configuration of governance rules, norms, and practices. *'Good governance' is both the process and the outcome of a governance regime based on ethical universalism*, which the author describes as the situation when the state rules impartially and impersonally in favor of public interest (being autonomous from narrow private one, individual, group, or elite capture). Ethical universalism is a norm and a practice of individualistic societies, where equal treatment applies to everyone regardless of the group to which one belongs (Parsons, 1997: pp. 80–82). Its opposite is particularism, the governance norm allowing allocation of public resources in a nonuniversal way, according to particular ties. For most countries and much of history, ethical universalism was not the dominant governance regime: access to resources was rather strictly controlled by violence and corruption (North et al., 2009). UNCAC demands that its signatories deliver in the same time certain outcomes of governance (accountability, integrity, equity, and control of corruption) and arrive at this through a certain process (transparency, consultation, and 'proper' management).

The United Nations Development Program defines good governance as "The exercise of economic, political, and administrative authority to manage a country's affairs at all levels. It comprises mechanisms, processes, and institutions through which citizens and groups articulate their interests, exercise their legal rights, meet their obligations, and mediate their differences" (UNDP, 1997). The World Bank (1994) describes what it should be and look like: "… epitomized by predictable, open and enlightened policy making; a bureaucracy imbued with a professional ethos; an executive arm of government accountable for its actions; and a strong civil society participating in public affairs; and all behaving under the rule of law."

Such definitions obviously describe *national* institutions and practices. This causes much confusion, since the legal

definition, meant to circumscribe 'corruption' as a crime, obviously depicts *individual* behavior. The most frequent definition of corruption in current literature is 'the abuse of public office for private gain' (Tanzi and Davoodi, 1997; Kaufmann, 2007; Rose-Ackerman, 1999), with variants such as 'abuse of power' or 'abuse of entrusted authority.' Corruption is nearly always defined as *deviation from the norm* (Scott, 1972) because it presumes that authority or office is entrusted to someone not to promote private gain (for self or others) but to promote the public interest, in fairness and impartiality. This was justly criticized by Kaufmann and Vicente (2011), and enlarged by Joseph Nye to "behaviour which deviates from the formal duties of a public role (elective or appointive) because of private-regarding (personal, close family, private clique) wealth or status, gains, or (which) violates rules against the exercise of certain types of private-regarding influence" (Nye 1967(1966)). By including 'status' next to 'wealth' among gains, Nye practically defined as corrupt all types of nonuniversal exchanges within the government realm. This is confirmed by UNCAC, which implies that any authority that is not exercised in a universal way is corrupt.

The current definition of corruption rests therefore on the presumption that it is wrong to use public office for private gain. But public office has no longer been considered a source of exploitable income only in the modern state; prior to modernity, it has been the norm for many centuries (Weber 1922(1968)). In *The Gift*, French sociologist Marcel Mauss argued that the act of giving gifts creates a social bond with an obligation to reciprocate on part of the recipient, since "the objects are never completely separated from the men who exchange them" (Mauss 1925(1990): p. 31); in the absence of reciprocation, a loss of 'status' and 'honor' would occur (Mauss 1925(1990)). Roland Mousnier, a French historian, has furthermore argued that until the eighteenth century, honor, status, and social prestige were far more important in certain European societies (such as France and Spain) than wealth (Mousnier, 1969). In their 1984 book, sociologists Eisenstadt and Roniger (1984) also described nonmodern patron–client relations that shape many contemporary societies in different cultures (Catholic, Buddhist, and Islamist) and decisively determine both interpersonal exchanges as well as the type of connection between a people and its government. Neither historical sociology nor anthropology have ever made the claim that the kind of impersonal and objective bureaucratic relations that Max Weber described as underpinning modern states is some sort of final unavoidable stage in a long chain of evolution (Weber 1922(1968): p. 959).

Taking modernity for granted includes not just the presumption of ethical universalism as the main norm informing exchanges, but a second, equally flawed presumption of the existence of a clear distinction between public and private in every society. As Alena Ledeneva (2009) has shown most formulas of corruption can be understood as a 'twist' of something public into something private and assume not only that the public and private spheres operate according to corresponding sets of rules and norms, but that it is also wrong to mix them. Even today, however, whole societies exist that rely on collectivistic, not individualistic, arrangements and do not value and articulate in practice such distinctions. "It is wrong to presume that the default design of government is of an impersonal state on one side and the individual citizen on the other." Many societies are instead organized as groups of 'clients' with varying degrees of influence and whose interests compete or overlap. Multiethnic societies tend to use ethnicity as the chief marker, but also clan, religion, city of birth, political party, club, family, former school, etc. have all been reported to provide personal ties that inform exchanges and transactions between an individual and the state, crossing the private–public boundary permanently. Connections of every kind are used to personalize transactions with the state and a multitude of particular transactions take place daily, some illegal, others not. We find words for it in many languages. We criminalize only particular exchanges, which include material gifts (bribes) and which often occur in the absence of a bond/connection of another nature with the goal of establishing one. But why is bribing worse than being hired simply because one has the same skin color as the supervisor or is the son of a friend?

Grounded in the delusion that modernity is the norm – with everything this presumes: impersonal bureaucrats, objective knowledge, etc. – one discovers the third major untested presumption of current economic theory of corruption, 'that a well-meaning principal always exists whose trust is abused by some agent' (Rothstein, 2011). Generally, the ruler is seen as the principal and the bureaucrat as the agent (Becker and Stigler, 1974; Van Rijckeghem and Weder, 2001). The rulers cannot exactly observe which agents behave honestly, since they do not possess all the relevant information that the agents have; this provides the agent with opportunities for corrupt exchanges. The presumption that a principal is above corrupt exchanges is taken for granted, and most assistance for good governance programs is directed to such principals (government and anticorruption agencies). But those who have the highest discretionary power also have more opportunities to be corrupt, which makes high-level government officials – represented by legislators or elected public officials – as the best placed to institute or manipulate policy and legislation in favor of particular interest groups in exchange for benefits. Thus, the principal risks being more often than not a patron, if not a *capo di tutti capi* (*the top 'Godfather'*) and such strategies risk running like the old Soviet joke of the man who left the factory every day at the end of program with an empty wheelbarrow that security would scrupulously check to prevent him from stealing, only to turn out after some months that he was actually stealing wheelbarrows.

A less popular version of the principal agent model in good governance literature presumes the vigilant and honest citizens (voters) acting as principals to keep officials accountable (Myerson, 1993; Persson and Tabellini, 2000; Besley, 2006). But what if at the grassroots one finds only clients or disempowered citizens? Insofar as a sufficient number of actors play the game instead of challenging it, this structure of incentives leads to a collective action problem of the second order (Ostrom, 1998). The overwhelming evidence stemming from developing countries is that rulers are rather inclined to treat the state as their own patrimony, and that personal autonomy and political participation, two indicators of political modernity informing a society's capacity to

constrain rulers, are generally very low. In collectivistic societies with closed access, actors strive to accede to the privileged status groups rather than challenge the rules of the game and make them more equitable to everyone (Mungiu-Pippidi, 2006).

The fact that most definitions of corruption refer to the individual level leads to another problem: how can the deviation-based definition be applied in a system where 'particularism (treating a person not as an indistinct individual, but according to particular ties or group affiliations)' is actually the norm? Consider a government that is captured by an ethnic group or a clan of some kind that distributes benefits mostly to its own members and forces others to engage in bribery to get some share of those benefits. What is the deviation here and what should be criminalized? Fortunately, governments adopt constitutions and treaties – it is a part of the great and often content-empty modernization effort. Most of these documents make claims to ethical universalism as a governing principle, creating important contradictions between the informal and the formal norm in such societies (van de Walle, 2001).

Some scholars struggled to find differences between various manifestations of particularism, for instance, clientelism and corruption, in the observance of legal norms (Eisenstadt and Roniger, 1984; della Porta and Vanucci, 1999: p. 273; Johnston, 2005). Other scholars struggle with depictions of various corruption categories (grand, petty, administrative, political, etc.). These distinctions are not very useful, as societies can display a great variety of particularistic practices. What is important is if particularism, as a general category indicating the deviation from the norm of ethical universalism, is the exception or actually the norm. *Is particularism the rule of the game or not (are the majority of transactions carried by the state particular or universal)? If it is the rule of the game (because control of corruption does not exist), one will find a cluster of such practices: vertically structured favoritism (clientelism/patronage), horizontally structured particularism (negative social capital networks, old boys), kinship-motivated particularism (nepotism, ethnic favoritism), bribing, extortion, etc.*

'Corruption' in a developing context is therefore often used only as a catch word for all such nonuniversalistic practices, in other words for the nonmodernity of a society. Public *corruption emerges from many development studies as an indicator of the lack of the institutionalization of market economy and democracy in transition societies* (Haerpfer and Wallace, 2000). To paraphrase St Augustine, who famously considered evil to be the absence of good, *public corruption can be seen as the absence of a rational legal order translated into everyday behavior.*

Typology of Governance Regimes

While ethical universalism and particularism are the two opposites of a continuum defining relations between individuals on the one hand and individuals and the state on the other (with trust and social trust, respectively, defined as *expectation shaped by the experience of such relationships*), patrimonialism was originally described by Weber more as a form of political domination (Weber 1922(1968)). Thus, another variable power was introduced. Here, authority rests on the personal and bureaucratic power exercised by a royal household, whose power is formally arbitrary and under the direct control of the ruler. Domination is secured by means of a political apparatus staffed by slaves, mercenaries, conscripts, or some other group (not a traditional land-owning aristocracy) that has no independent power base. By controlling the instruments of power in this way, the patrimonial ruler can extend personal grace and favors at the expense of traditional limitations on the exercise of authority. In his 1973 book, *Traditional Patrimonialism and Modern Neopatrimonialism*, Shmuel N. Eisenstadt used the derived term 'neopatrimonialism' to describe a mixed system in which formal institutions of modernity from the West are imitated, with most informal institutions remaining of a patrimonial nature.

Neopatrimonial regimes have single rulers who treat the state as their 'own' patrimony. However, many new democracies, which no longer have such rulers or families, but instead competing political parties, have similar nonuniversal allocation of public resources systems, including patronage, nepotism, and favors (O'Donnell, 1996: p. 40). In many new democracies, informal particularistic structures exist alongside and tend to undermine formal universalistic institutions (O'Donnell, 1996: p. 41). How sustainable are such regimes? Some countries have operated for decades under such arrangements, from the North African neopatrimonial dictatorships that collapsed – to everyone's surprise in early 2011 (e.g., Tunisia) – to electoral democracies in Latin America, Southeast Asia, and the Balkans. The claim is that these countries are *not developing precisely due to the persistence of this state of affairs, termed as limited access order* (North et al., 2009).

Table 1 proposes a typology of governance regimes attempting to integrate current theories. 'A governance regime is defined by a stable normative configuration around a dominant norm.' The first governance regime is defined by the *open access order* (North et al., 2009), which corresponds to Dahl's *polyarchy* or Karl Popper's *open society*. This type of regime relies on an individualistic society, with political equality, high personal autonomy, and high civic participation; the state is autonomous from private interest and allocation and policy formulation are achieved on a basis of ethical universalism and transparency. There is very little contradiction between formal and informal institutions, and corruption, when it occurs, is indeed a deviation from the norm of ethical universalism and public impartiality. There is currently an unprecedented large number of countries that aspire to be perceived as having such regimes – Transparency International's ratings has spurred the competition among states to prove themselves closer to the standards published in their annual Corruption Perception Index.

The majority of countries – nearly all with modern constitutions and various kinds of institutional transplants imported from Western democracies – fall under the category of limited access order. Here, the author introduces an important distinction within limited access order societies and differentiates between the patrimonial type described by Weber (where power is a monopoly) and those that have managed to introduce some form of pluralism with the institution of regular elections (several groups compete for the spoils, but spoiling the state and state capture remain the rule of the game). The latter category is called 'competitive particularism,'

Table 1 Governance regimes and their main features

Governance regimes	*Limited access order*			*Open access order (Universalism)*
	Patrimonialism	*Competitive particularism*	*Borderline*	
Power distribution	Hierarchical with monopoly of central power	Stratified with power disputed competitively	Competitive with less stratification	Citizenship Equality
State autonomy	State captured by ruler	State captured in turn by winners of elections	Archipelago of autonomy and captured 'islands'	State autonomous from private interest (legal lobby, etc.)
Public resources	Particular and predicable	Particular but unpredictable	Particular and universal	Ethical universalism
Separation private–public	No	No	Poor	Sharp
Relation formal/informal institutions	Informal institutions substitutive of formal ones	Informal institutions substitutive of formal ones	Competitive and substitutive	Complementary
Mentality	Collectivistic	Collectivistic	Mixed	Individualistic
Government accountability	No	Only when no longer in power	Occasional	Permanent
Rule of law	No; sometimes 'thin'	No	Elites only	General; 'thick'

a governance regime that has replaced violent power grabbing with corrupt elections (sometimes free, although not fair), which is a step forward from patrimonial regimes. Allocation is, however, particular and unfair, rent-seeking practically common behavior, rule of law is poor (those in power are above the law), and the state is perceived as an instrument of spoliation of the many and enrichment of the few, which greatly subverts its legitimacy and capacity. A similar concept was used in connection with postwar Italy, described as 'competitive corruption' (Golden and Chang, 2001). *A culture of privilege reigns in such societies based on closed access order, making unequal treatment the accepted norm in society.* Social acceptance of particularism varies across regimes, but elites can buy social peace if resources exist (for instance, by subsidizing basic foods, as in some neopatrimonial Middle East and North African countries). Due to poor civil society and low personal autonomy, collective action to render governments more accountable and transparent is costly and infrequent. Free elections bring about occasional changes of government, but hardly better governance, as political parties are the main profiteers from the system and form cartels in favor of the status quo. In the lower echelons, frequent corruption might be regarded as a perk of the inferior position, tolerated because it represents an unofficial form of compensation granted to subordinate officials for their lack of influence and power (Huntington, 2007: pp. 259f). These categories (already described in Mungiu-Pippidi, 2006) overlap in part with Kaufmann and Vicente's (2011) (1) 'illegal corruption equilibrium,' where the political elite does not face binding incentives; (2) a 'legal corruption equilibrium,' where the political elite is obliged to incur on a cost to 'deceive' the population; and (3) a 'no-corruption equilibrium,' where the population cannot be deceived.

The ideal types of governance regimes in Table 1 present important differences: the 'borderline' category is not a regime type but a transitional regime with fuzzy borders, which corresponds to the 'doorstep' category of North et al. (2009). In other words, this type captures those societies that have fulfilled some basic and necessary conditions of progress toward open access order and the two normative orders (the old and the new) coexist confrontationally without one managing to become dominant. The important differences between governance types cut across state and society: power distribution is uneven, from the classic one group (family/person) as main power holder and owner of the state with chief control over rents allocation (in patrimonialism) to a larger strata (political elites) holding the same privilege (and disputing it across status groups) in competitive particularism and finally to the equal power regime with open access. Pluralism does not bring about better governance, because patronage subverts democracy, informal client–patron relations structuring politics on a vertical and particularistic relation. Voters in such regimes act as clients 'selling' their vote against favors; occasionally, unaffiliated voters manage to elect an anticorruption president, but then the new president would develop a new clientele, as between elections there are no normative constraints. Under patrimonialism, rule of law can at best evolve to 'thin' (applied predictably, even if not 'just' in its essence); under competitive particularism it will always be interpreted in favor of the group in power (hence the danger of unleashing anticorruption campaigns, which can be used only against political opponents). Power holders are accountable in competitive particularism only when they fall from power, because only rulers in open access order regimes are not above the law and can be prosecuted at any time. Today, one finds that most democratized patrimonial regimes remain in the realm of competitive particularism, with a few Southeast Asian and more East European cases evolving to borderline situations.

The three ideal types differ in the essential elements explaining governance: informality, power distribution in society, and autonomy of the state toward private interest, which result in a certain type of resource allocation. The borders between categories are not well defined and historical thresholds are difficult to identify. Historians present the evolution from the first regime type to the last type as

a sequence, rather than a big bang. Furthermore, this involves such a broad institutional transformation it is highly difficult to distinguish it from modernization in general. In his book, *The Origins of English Individualism*, historian Alan Macfarlane (1978) argues that many countries in the developing world have not yet achieved the first transformation from rural collectivist society to basic market relations based on individual property. However, they are expected to succeed in the second transformation from governance based on particularism to one based on ethical universalism.

Development of Control of Corruption

The explanation for ethical universalism becoming the current dogma (although still on paper for many countries in the world) lies in its association with highly successful economies. Its intellectual heritage seems to run from the Stoics (doctrine of natural law) to Cicero (106–43 BC), Saint Isidore of Seville (*c.*560–636), John of Salisbury (*c.*1120–80), Aquinas (1225–74), Brunetto Latini (1220–94), and Marsilio of Padua (*c.*1275–1342). From then on, it spread in several directions with the Renaissance to become inbuilt in modern state building doctrine in the works of Montesquieu and the American Federalists. The legal philosophy of Cicero seems to have been the most influential early source (Carlyle and Carlyle, 1903; Neumann, 1986; Skinner, 1989). In the first book of *De Re Publica*, Cicero argued for equal treatment of citizens under the law and called the Republic 'an association of rights' (Cicero, 1877: p. XXXII). In *De Legibus*, he further argued that both justice and law derive their origin from Nature, while 'wicked and unjust statutes' are 'anything but laws' (Cicero, 1877). His ideas had an impressive following in the Middle Ages, from Isidore (Isidore of Seville: The Etymologies (or Origins) quoted after the critical edition by W. M. Lindsay, published by Oxford University Press, Oxford, 1911, available at: http://penelope.uchicago.edu/Thayer/E/Roman/Texts/Isidore/home.html.) of Seville who passed them to Aquinas (Aquinas quoted after Aquinas, Thomas: Summa Theologica, Part I–II (Pars Prima Secundae), from the Complete American Edition, translated by Fathers of the English Dominican Province, (release date 2006), available at: http://www.gutenberg.org/cache/epub/17897/pg17897.txt) and then to Brunetto Latini who reformulated and transmitted the republican ethic to other thinkers like Remigio and Dante, and he also used it as the basis for his formal treatise on city-state government (Jones, 1997: 461–462). On the basis of Cicero and Isidore, Aquinas argued in the first article (Aquinas: I–II, Q. 96, Art. 1) of *Summa* "Whether human law should be framed for the community rather than for the individual?", "human laws should be proportionate to the common good," and further, "laws are enacted for no private profit, but for the common benefit of the citizens" (Aquinas: P(2a)- Q(90)-A(1, 2)). In *Defensor Pacis*, Marsilio of Padua further stipulated that the wisdom of a minority does not entitle them to enact legislation on behalf of the majority. Recognizable within Aquinas' and Marsilio's ideas are seeds of ideas of government accountability, 'thick' rule of law and public participation, the three key foundational concepts of what today is called 'good governance.' While these ideas (the thought, not the practices) were extremely widespread, particularly in Italy's communes, where they informed the special tracts of city government that erupted in the early thirteenth century and infused them with republican ideology, such arguments were also made on behalf of monarchs. John of Salisbury argued in the *Policraticus*, Book Four, Chapter 1, that "Between a tyrant and a prince there is this single or chief difference, that the latter obeys the law and rules the people by its dictates, accounting himself as but their servant. […]"

But what is the sense of establishing ethical universalism as the main norm of treatment of citizens or subjects if they are undeserving? In Chapter XVII of his *Discussion on Livy*, Machiavelli soberly suggests that a corrupt people coming onto their liberty can maintain its freedom only with the greatest difficulty. The foundation of control of corruption is in the mentality of the people: "where the people are not corrupted, tumults and other troubles do no harm; but where corruption exists, well ordered laws are of no benefit." He also discussed the possible inconsistency between legal mores and real mores, or, between formal and informal institutions, when he stated "For as good customs have need of laws for maintaining themselves, so the laws, to be observed, have need of good customs."

Mainly due to Aquinas, Cicero's influence survived the Middle Ages. From the Renaissance to the Enlightenment and up to the eighteenth century, his work remained mandatory reading for elites and spread far beyond the circle of legal scholars. Authors such as Pocock (1975) argued that America's founding fathers obtained many ideas from Machiavelli, but Cicero's direct influence can also be traced to Montesquieu and the Federalists (Botein, 1978: p. 150; Reinhold, 1984: p. 315).

The foundations of the Western vision of 'good governance' are therefore Latin and pagan, but they were reinforced by mainstream Catholic doctrine in the twelfth century, long before the Renaissance and Reformation, and their later rediscovery by the Enlightenment. Ethical universalism thus became strong in the European legal philosophy early on and was exported to British colonies; later, political and religious emancipation opened the road to broader interpretations of fair and virtuous governance. But nearly two millennia of a Western tradition of upholding ethical universalism as a basic governance principle passed until its becoming universal doctrine.

European control of corruption must be understood as a gradual process of state building: the doctrine and the practice both took a very long time to become established. One can hardly speak of a 'state' under European feudalism, which was a transterritorial and hierarchical connection between individuals. The result of such a network was not a 'public' state the way it is understood it today. Power offices were completely patrimonial. In the same way that vassals equipped their own troops and came to fight for their overlord when summoned, judges and tax farmers (Tax collectors were private individuals who covered their expenses from what they collected. The tax collector who receives a salary from the government is mostly a modern phenomenon.) were entrusted a task to fulfill as a duty using their own material and human resources. They were allowed to reimburse themselves from plunder of the enemy, fees from claimants, and other means. This in itself was not dishonest. The 'corruption' encountered in the Middle

Ages, the Roman Curia, or the Stuarts Court is improperly labeled, as no public interest, objectively defined, existed, and few 'constitutions' rested upon ethical universalism. It was mostly embezzlement and fraud from the masters. This was different from Italian Republics, where public property and interest were clearly defined. Only when central power lost control over tax farming and office sale regulations, bad governance and corruption can be referenced. However, initially, the sale of offices was a progressive act, praised by Montesquieu, Burke, and Bentham, a way to open offices, previously held by privilege, to new classes. It was in fact a way to democratize access to power. As long as demand surpassed the offer, conditions could be put on bidders to fulfill certain criteria of competence, and the funds they collected afterward could be regulated. When demand fell, however, criteria were relaxed and incompetents started to fill in these positions and govern poorly and arbitrarily, resorting to extortion to cover their investment (Swart, 1949: pp. 92–94). West European sovereigns who used sale of offices to finance their wars – nearly all of them – took time to realize that this was also a way to lose wars. In the eighteenth century, incompetent French and British officers who had bought their way into the army lost many battles in the colonies before the practice of selling commissions was amended by some form of examination of competence. By and large, the sale of offices and the financing of government by fees rather than taxes were stages in the development of the state and it is questionable that they could have been altogether skipped. The process of private–public separation was lengthy because the 'public' needed to be created from scratch. It was first created in the law, even in feudal monarchies, and far later in other realms such as finance and army. The medieval kings of France financed war from their own coffers or loans from Italian financiers. The first act to render the budget transparent attempted by Louis XVI's Minister Necker was rewarded by public outrage, because the Court's expenses, part of public expenditure, seemed to the public both extravagant and exaggerated. The French Revolution introduced the separation between public and private. It took many private bankruptcies to promote public finance sheltered from a monarch's personal extravagance, just as it took heavy military defeat or threat of defeat to promote merit-based competitions in the army. Military threat or serious defeats prompted military reform and merit-based systems for officers in the monarchies of Sweden, Denmark, Britain, Hapsburg Empire, and Prussia. Of course, there was always some ideology behind the promoters of reform: Empress Marie-Therese and her son Joseph II had enlightened ideas, Burke advocated merit-based systems for the British abroad, the Federalists had read Montesquieu and Cicero, and so on. But it seems fair to say that triumph of reformist ideas and the building of ethical universalism as a norm was brought about by necessity rather than virtue. Plainer even, the party of virtue would have remained marginal or in opposition had striking necessity not shown that the old system was leading to disasters of existential proportions.

When European countries like Denmark and Britain started to decisively implement political modernization in the second half of the nineteenth century, some fundamental elements of control of corruption had already been put in place, despite still widespread particularism. Enfranchising new groups and removing the privileges of the old (titles, sinecures, and immunities) was a gradual process that strengthened impartiality and objectivity of government but did not put it into question. This was the gradualist path, resulting from power equilibrium between the new and the old, which did not grant any group sufficient power to become a predatory elite. It evolved through a succession of equilibria that took at least a century. In Britain, the reform of sinecures and 'old corruption' started in 1780, and the building of a more impartial civil service was as nearly over by 1840, followed periodically by new waves of improvements (Cohen, 1965). Electoral regulation reform also evolved starting with the beginning of the nineteenth century and culminating between 1868 and 1883. The main goal of these reforms was to prevent the vote from becoming a commodity and being traded, as it had been in early British democracy. The secrecy of an extended ballot and very transparent and carefully audited election expenses (with ceilings for spending) worked in the end. While in Denmark the monarch was the main principal of reforms, in Britain it was the Parliament that debated, investigated, and gradually adopted reforms to foster the integrity of the voting process. In France, the path was revolutionary. The French Revolution was to a large extent an antiparticularism revolution, directed more against privilege than against property. The 1791 French Constitution stated clearly that sovereignty 'belongs to the nation. No segment of the people and no individual can appropriate it.' However, the succession of regimes induced by the Revolution brought anything but impartiality. In the nineteenth century, administrative 'cleansing' (épuration), initiated by the Revolution became the rule of the game in the relation between political power and administration. Each change of regime was followed by a total sweep of the previous administration in 1815, 1830, 1838, 1852, the great political turmoil of 1977–79, and 1883 (Rosanvallon, 1990: pp. 77–79). Appointment of partisans to administration assured that administrators would be loyal to the policies of leaders, elected or not. Civil servants did not swear an oath to public interest, but to the party in power, a habit that persisted long into the twentieth century. In parallel, the nineteenth century saw the development of a strong trend in the public opinion against favoritism and particularism in general. However, the revolutionary path based on power and administrative overhauls proved less conducive to the development of ethical universalism: patronage and political clientelism became resilient features.

In the era of small government, in the United States, party machines provided services for the poor, the unemployed, and new immigrants and patronage allowed the construction of mass-based parties (Arnold, 2003). The passage of the US Pendleton Act of 1883, which introduced the merit-based system, was triggered by the assassination of President Garfield by one of his electoral campaign workers, disappointed not to be appointed ambassador as reward. The Act, influenced by the earlier Northcote–Trevelyan reforms in Britain (themselves originated in scandals related to the lack of preparedness of the army), specified for the first time that "no person in the public service is … under any obligation to contribute to any political fund," and "no person in said service has any right to use his official authority or influence to coerce the political action of any person…." Nevertheless, it took

decades for the Americans to arrive at a merit-based non-politicized civil service, which they managed before the French.

Thus, there is a variety of paths to control of corruption. In Europe, the Scandinavian countries, Austria, and Germany managed to develop an impartial state prior to democratization. Britain combined some limited democracy with control of corruption, and advanced steadily through gradual reforms. The French and the American ways to ethical universalism, although fairly specific, are similarly tied into the history of their respective republics, with intense politicization, spoiling, and favoritism. Every country, sometimes every region, seems to have evolved on a path of its own to control of corruption and geography is not enough to provide clear and distinct paths. The work remains to some degree unfinished everywhere.

Achieving Control of Corruption in Contemporary Times

The problem with assessing corruption at country level has always been the difficulty of measuring it. Seeing its nature as described in this article, it seems quite a challenge to measure corruption across time and countries. Kaufmann et al. (2006) have nevertheless forcefully argued that corruption can, and is being, measured in three broad ways. (1) *By gathering the informed views of relevant stakeholders*. These include surveys of firms, public officials, and individuals. (2) *By tracking countries' institutional features*, which provide indirect information, e.g., procurement practices, budget transparency, etc. These do not measure actual corruption, but can provide useful indications of the possibility of corruption (…). (3) *By careful audits of specific projects*. These can be purely financial audits or more detailed comparisons of spending with the physical output of projects.

To measure corruption, one therefore disposes of expert scores (criticized for their lack of transparency); of public opinion surveys, which ask about both perception and experience; of business or experts' surveys, which aggregate more individual experiences and beliefs (for instance World Economic Forum); and finally of statistical aggregates of all the above, either in the form of simpler averages, such as the Corruption Perception Index by Transparency International, or of more refined unobserved components extracted by the World Bank Institute (Control of Corruption, Rule of Law). While these indicators have been severely criticized for their lack of validity and reliability because an industry of criticizing indicators developed against the industry of producing them (Andrews, 2008; Thomas, 2009), the fact remains, as argued by Kaufmann et al. (1999) and Knack (2006), that most sources are highly correlated: citizens, businesses, and experts tend to agree on which countries are more or less corrupt. The corruption index developed by Daniel Kaufmann for the World Bank Institute has been published every two years since 1996, covers almost 200 countries, and is computed on the basis of some 100 individual variables on perception of corruption, drawn from about 40 data sources produced by more than 30 different organizations (Kaufmann et al., 2005). To combine the various corruption indicators into a single index, an unobserved component is extracted. The estimate of corruption is given therefore by the weighted average of (rescaled) scores of each of the component indicators. The variance of this conditional distribution provides an estimate of the precision of the corruption indicator for each country. The point estimate of corruption is the mean of the conditional distribution given the observed data and ranges between −2.5 (most corrupt) and +2.5 (least corrupt).

Figure 1 shows regional averages of Worldwide Governance Indicators Control of Corruption. (For the full composition of sources used for this aggregate indicator see http://info.worldbank.org/governance/wgi/pdf/cc.pdf.) The Organisation for Economic Co-operation and Development (OECD) countries' average is separated by a gap of over 30% of the scale from the next region, Eastern Europe (including the Baltics and the Balkans). The latter has evolved more than any other in the world since 1989 (roughly up 15% of the scale), although this applies only to the successful Western part, since what is left of the former Soviet Union actually rates at the very bottom, below sub-Saharan Africa. Not only do the rest of the continents lag far behind the OECD area but – with the exception of Eastern Europe – the trend is toward stagnation, not improvement. The exception is the Caribbean, not represented in the graph on account of their small population.

Recent studies have therefore progressed from asking what causes corruption as deviation to how can control of corruption as norm be explained and in particular how can the transition from one governance regime to another be made (Collier and Vicente, 2011; Mungiu-Pippidi, 2006; Mungiu-

Figure 1 Evolution of control of corruption by global regions (on average).

Pippidi et al., 2011; North et al., 2009; Vicente and Wantchekon, 2009; Birch, 2012). In the absence of serious counterweights, the spoiling of the state by those in power should be presumed to exist by default, since most human societies have limited resources to share, and people tend share them with their closest relatives and not with everyone else. A change in such a governance regime would imply a change in the power equilibrium suggested by Robert Klitgaard (1988: p. 75) in this formula:

$$\text{Corruption} = \text{Monopoly} + \text{Discretion} - \text{Accountability}$$
$$(C = M + D - A)$$

The formula has been developed by Mungiu-Pippidi et al. (2011) to the more explicit:

$$\text{Control of corruption} = \text{Resources (Power discretion} + \text{Material resources)} - \text{Constraints (Legal} + \text{Normative)}$$

This equilibrium formula can be empirically tested and offers a more complex picture, not only of the individual causes of corruption (or even categories of factors), but also of their interaction, which allows for a better understanding of why certain policy combinations work and others do not. All elements of the formula can be affected by human agency. Resources, for example, are not an absolute given; they can be manipulated by policy. Power resources can be increased by discretionary regulation and red tape and decreased by transparency; many anticorruption policies focus on that area. Material resources generally include four basic categories:

- Public jobs, as the public sector can be politicized and each winning party fills not only political offices but many civil service positions with its own people.
- Public spending, for example, the commissioning of public works, but also preferential bailouts, subsidies, loans from state banks, and any form of monetary rents.
- Preferential concessions and privatizations from the state property.
- Market advantages in the form of preferential regulation.

This equilibrium cannot be changed on behalf of legal constraints alone, as evidence shows (Huther and Shah, 2000; Mungiu-Pippidi et al., 2011). But effective strategies do exist, as long as credible principals can be found to lead the change process.

Cortical Areas Engaged in Movement: Neuroimaging Methods

Jody Culham, Mind Institute and Brain, University of Western Ontario, London, ON, Canada

© 2015 Elsevier Ltd. All rights reserved.

Nomenclature

aIPS anterior intraparietal sulcus (human brain area; putative homolog of AIP)
AIP anterior intraparietal area (macaque brain area involved in grasping)
aSPOC anterior division of SPOC (human brain area; putative homolog of V6A)
cIPS caudal intraparietal sulcus (macaque brain area involved in processing visual orientation)
CZ cingulate zone of secondary motor cortex
DTI diffusion tensor imaging
FEF frontal eye fields
fMRA functional magnetic resonance adaptation
fMRI functional magnetic resonance imaging
LIP lateral intraparietal area (macaque brain area involved in eye movements)
M1 primary motor cortex
mIPS medial intraparietal sulcus (human brain region)
MIP medial intraparietal sulcus (macaque brain area involved in reaching)
MVPA multivoxel pattern analysis
NHP nonhuman primate
PEF parietal eye fields (human brain region; possible homolog of macaque LIP)
PET positron emission tomography
PFC prefrontal cortex (region of frontal lobe anterior to premotor cortex)
PMC premotor cortex
PMd dorsal premotor cortex
PMv ventral premotor cortex
PPC posterior parietal cortex (all of parietal cortex behind S1)
pre-PMd region in front of PMd-proper
pre-SMA region in front of SMA-proper
PRR parietal reach region (macaque brain area involved in reaching, overlaps with MIP and perhaps V6A)
pSPOC posterior division of SPOC (human brain area; putative homolog of V6)
RSC resting state connectivity
S1 primary somatosensory cortex
SEF supplementary eye fields
SMA supplementary motor area
SMC secondary motor cortex
SPOC superior parieto-occipital cortex (human brain area involved in reaching; comprised of aSPOC and pSPOC)
TMS transcranial magnetic stimulation
vIPS ventral intraparietal sulcus (human brain area; putative homolog of VIP)
VIP ventral intraparietal area (macaque brain area involved in head movements)

Abstract

Neuroimaging, particularly functional magnetic resonance imaging, has identified and characterized many areas of the human cerebral cortex involved in planning and executing body movements. Motor commands are sent to the spinal cord from primary motor cortex, which receives input and modulation from secondary motor cortex, parietal cortex, and prefrontal cortex.

Some have argued that all mental functions ultimately have bodily movements as the end goal; after all, evolution selects on actions rather than perceptions and thoughts (except insofar as they affect movements). Thus it could be argued that the entire brain is involved in body movements. Nevertheless, a more useful framework would be to consider how different brain regions are involved at different levels in producing movements. This article will address primate, especially human, brain regions – particularly within the cerebral cortex – that are involved at intermediate levels of planning and controlling movements, with an emphasis on evidence from human neuroimaging.

Hierarchies of Movement Control

One could think of four hierarchical levels in the neural control of movements (Figure 1). At the lowest level are the final output stages of a movement. Muscle movements are driven by input from motor neurons that originate in the spinal cord. These motor neurons receive sensory input about touch and body position from the body that enable fast reflexes (such as when the finger gets burned on a hot stove and reflexively retracts). They also receive input from the brain. Structures in the brainstem and midbrain send output to the spinal cord to control balance and body posture. However, the main source of input

Figure 1 Schematic of key cortical and subcortical regions in the motor control hierarchy and their interconnections. Motor output is sent to the muscles via the spinal cord which receives output via the corticospinal tract (thick white arrow) from primary motor cortex (M1). In addition, the spinal cord receives input from various subcortical tracts, many of which pass through the brainstem. M1 receives input from parietal cortex and secondary motor cortex. Parietal cortex receives input from brain regions that process sensory input from the three spatial senses: visual cortex, somatosensory cortex, and auditory cortex. Secondary motor cortex has crosstalk with regions in prefrontal cortex. In addition, processing in M1 is modulated by two subcortical loops that receive input from many cortical areas and feed back to M1. One loop goes though the basal ganglia and thalamus. Another loop goes through the brainstem (pons), cerebellum, and thalamus. The hierarchy provides one way to think about the motor functions of the regions shown. The schematic is simplified, not all connections (nor bidirectionality of connections) are shown, and not all brain regions lie on the parasagittal plane depicted.

to the spinal cord comes from the primary motor cortex (M1) via the corticospinal tract. M1 receives direct and indirect input from secondary motor cortex (SMC), posterior parietal cortex (PPC), and prefrontal cortex (PFC). SMC includes a host of various brain regions that serve as an interface between sensory inputs (via the PPC) and cognitive inputs (via the PFC). The PPC (behind primary somatosensory cortex, S1) receives multisensory input from visual cortex, somatosensory regions (which code touch, pain and body position sense) and auditory cortex. PPC combines sensory information to plan, execute and control actions. PFC is involved in selecting and planning the appropriate response (and inhibiting inappropriate responses) based on expectations and the situational context. M1 is modulated by two major feedback loops. One modulatory loop involves the basal ganglia and plays a role in selecting and initiating movements based on cortical input. A second modulatory loop involves the cerebellum and plays a role in motor predictions and feedback, motor coordination, and motor learning based on cortical input.

In sum, the cerebral cortex – including primary motor cortex, premotor cortex, parietal cortex and prefrontal cortex – plays a key role in to top-down control of voluntary movements. This control is modulated by subcortical feedback loops and executed though spinal cord output to the muscles.

The Evolution of Cortical Areas Involved in Movement Control

Although most animals other than primates certainly have the ability to move, we see that the complexity and sophistication of movement control is particularly striking in mammals, especially primates. Species without backbones (invertebrates such as flatworms) have simple symmetric nervous systems that convey sensory information to ganglia (clusters of neurons) that control movements for simple locomotion. In relatively simple species with backbones (vertebrates such as frogs), a brain and spinal cord are present. Moreover the nervous system is crossed: the left side of the brain controls the right side of the body and vice versa. These species have both a cerebrum and a cerebellum that enable complex motions. The cerebrum is divided into two hemispheres that are each covered with a 'bark' or cortex comprised of the dendrites and cell bodies of neurons, where information is exchanged. The axons of the neurons form the white matter beneath the cortex that provides the 'wiring' between areas of the cerebral cortex and to subcortical brain structures. The cerebral cortex of vertebrates has shown dramatic expansion in more complex species. In simpler mammals, such as rodents, the cerebral cortex is largely composed of primary motor and sensory

areas. However, higher mammals have additional zones of cortical 'association cortex.' Areas within association cortex are not unequivocally dedicated to motor control or to processing sensory input from a single sense. Rather they are involved in integrating multiple senses, enabling the senses to guide motor actions, and performing advanced cognitive functions (such as decision making). For many decades, association cortex was poorly understood and not well differentiated, however, over the past 30 years, newer techniques have led to the discovery of a host of specialized areas within association cortex. Functional neuroimaging has played a key role in deciphering the functional regions within human association cortex.

Techniques to Study Cortical Areas Involved in Movement Control

Historically, the richest source of understanding the neural basis of movement control came from human neuropsychology, which revealed many clinical disorders of motor control arising from brain damage and disorders. For example, patients with damage to parietal and/or frontal cortex may show apraxia, a disorder in performing purposeful movements.

One additional source for the early understanding of cortical areas engaged in movement came from studies using animal models. Researchers in the nineteenth century found that stimulating different parts of the primary motor cortex in the dog brain led to muscle movements on the opposite side of the body. Strikingly, stimulating different locations in M1 led to movements of different body parts. This work, along with Wilder Penfield's seminal brain stimulation studies in humans in the 1930s (Penfield and Boldrey, 1937), showed that M1 contains a 'map' of the body in which adjacent body parts are represented in adjacent parts of M1. Notably, this map, like that in S1 does not represent all body parts equally. Rather the body parts that are most important for actions in everyday life (notably the hands and lips, for manipulation and speech) take up most of the motor map in M1, while those that are less important (namely the torso and legs) take up relatively little.

Beginning in the 1970s, neurophysiology of awake, behaving nonhuman primates (NHPs) led to the discovery of many specific cortical areas and their neural coding. For example, when electrodes were used to record single neurons in M1, the responses showed tuning for direction. For example, if the animal were pointing to locations on a large clock, one neuron might respond vigorously to the 11 o'clock position (and partially to the 10 and 12 o'clock positions) while another might respond vigorously to the 3 o'clock position (and partially to the 2 and 4 o'clock positions).

Recordings from single neurons in NHPs also revealed a mosaic of brain regions in parietal and frontal cortex with specialized functions tuned for example to the body part to be moved. For example, one area of parietal cortex (the lateral intraparietal area, LIP) was found to use visual information to guide eye movements while another parietal area (the anterior intraparietal area, AIP) was found to use visual information to guide hand movements like grasping and manipulation.

The advent of neuroimaging, particularly functional magnetic resonance imaging (fMRI) in 1992, enabled the emerging field of cognitive neuroscience to develop a much finer understanding of the human brain regions involved in movements. When a particular region of the brain is active, blood flow increases, causing increases in blood oxygenation that can be measured with fMRI. fMRI can sample small regions (called voxels, typically about 3 mm in each direction) rapidly every couple of seconds while the participant receives different stimuli or performs different tasks. Statistical comparisons can then reveal the brain regions that are involved during one condition relative to another. Another neuroimaging technique, positron emission tomography (PET), can also measure brain activation but is less commonly used than fMRI in present day because it involves low doses of radiation and provides less spatial detail and slower timing.

Much of the early neuroimaging work led to the discovery of human brain regions that likely correspond to established areas within association cortex of NHPs. However, increasingly, human neuroimaging is addressing new questions such as which brain areas are involved in advanced human movements like tool use. In addition newer fMRI methods now enable researchers to infer the type of information that is coded in specific brain regions. In one approach (multivoxel pattern analysis, MVPA), researchers can use the spatial pattern of brain activation within brain regions to predict upcoming actions. In another approach (fMRI adaptation or fMRA), the fact that activation decreases when the same stimulus is repeated can be used to investigate what variations are considered 'the same' by an area.

Neuroimaging studies of bodily movements have been less common and slower to develop than studies of other sensory and cognitive functions because of the technical challenges of having people move inside MRI scanners. In fact, many studies, particularly early neuroimaging studies, investigated imagined, pantomimed or observed actions rather than actual action performance. Nevertheless, various approaches have been developed to enable the study of some real actions with fMRI, at least for limited movements with some body parts, especially the eyes and the hands. The movements of other body parts such as the head or legs are still largely problematic and scarcely studied with these techniques. Although most of the neuroimaging research on motor control has been done on humans, increasingly researchers are using fMRI with NHPs, an approach that holds considerable promise for understanding similarities and differences between humans and other primates.

Neurostimulation (particularly transcranial magnetic stimulation, TMS) is increasingly being used to temporarily perturb the function of specific human brain areas to see the effect on movements. While neuroimaging shows that a brain area is activated during a certain condition, it is a correlational technique that cannot demonstrate whether or not an area is essential for a particular cognitive function. Neuropsychology and neurostimulation can demonstrate that damage to a particular region affects the function, enabling stronger arguments about causality. In addition, neuroimaging may be combined with neurostimulation (with neurostimulation during or before fMRI scans) or with neuropsychology (to examine which brain areas are damaged and spared in

patients); however, these approaches have been relatively rare in the study of motor control.

More recently, newer neuroimaging techniques have enabled researchers to study not just the cortical areas engaged in movement but their interconnections. Diffusion tensor imaging (DTI) can use measurements of the diffusion of water molecules along various directions to reconstruct likely white matter tracts that connect areas. Resting state connectivity studies (RSC) can be performed while the subject is lying in the brain scanner without performing a task. This technique identifies brain areas that show synchronized activity, which can be used to infer functional connections (though not necessarily direct anatomical connections).

Specific Human Cortical Areas Engaged in Movement

The following review will focus on cortical regions involved in motor control (Figure 2). We will begin our discussion with primary motor cortex, the main source of commands to lower levels of the motor hierarchy. We will then examine the role of other regions of the cerebral cortex: the role of secondary motor cortex in motor planning, the role of posterior parietal cortex in sensorimotor control of various body parts, and the role of prefrontal cortex in the cognitive control of actions. The emphasis will be on human cortex based on results from human neuroimaging. Nevertheless, given that much human neuroimaging work has been motivated by physiological results from NHPs – particularly the macaque (rhesus) monkey brain – proposed equivalents (homologs or perhaps analogs) between the two species will be noted.

Primary Motor Cortex (M1)

M1 lies along the precentral gyrus of the frontal lobe. Neuroimaging has corroborated findings from other species and other techniques that human M1 contains a topographic map of the body representation. This map corresponds to the opposite (contralateral) side of the body (left M1 controls the right side of the body and vice versa), is inverted (with the feet at the top of the motor strip and the head at the bottom) and has an overrepresentation of the hands and face. The hand area of motor cortex is found midway up the precentral gyrus, where the gyrus curves backward. Within the hand area, various groups have found that moving different fingers yields activation that overlaps but has foci that follow a map. Above the hand area lie the representations of the arms and torso. M1 wraps over the top of the brain to the medial side, where the foot area representation is found. Below the hand area lies the representation of the face and head, particularly lips and tongue.

Secondary Motor Cortex

Numerous secondary motor regions lie in front of motor cortex, along the lateral convexity and midline of the frontal cortex.

Figure 2 View of the key regions of the human cerebral cortex involved in various types of movements. A lateral view of the left hemisphere is shown in front of a medial view of the right hemisphere. The renderings of the cerebral hemispheres have had the gray matter surface removed to enable regions within the sulci (concavities) to be seen. The fundus (deepest point) of each sulcus is indicated by a black line. The approximate location of cortical brain areas is shown in colors corresponding to their role in general motor control or the control of specific body parts.

Premotor Cortex

Premotor cortex lies just in front of M1 and is typically divided into dorsal (PMd) and ventral (PMv) premotor regions. Both regions have close connections with M1 but also have direct projections to the spinal cord that bypass M1 and are thought to modulate the control of movements. Numerous neuroimaging studies have implicated the dorsal subdivision, PMd, in motor control tasks that require selecting an appropriate response based on past experience. An everyday task that would involve these components is when a driver selects an appropriate response based on the color of a traffic light (green, yellow, or red). The motor decision involves selecting an appropriate action in response to an arbitrary cue based on past experience. Much of the work on PMd has focused on reaching movements and certainly PMd plays a key role here; however, recent work has shown it is also involved in controlling actions with other body parts such as the feet. Two subdivisions of PMd have been proposed: a posterior portion (PMd-proper) involved in hand movements and a more anterior portion (pre-PMd) involved in more cognitively demanding movements (such as conditional actions)

TMS to PMd affects participants' ability to select the appropriate response and to control arm movements during reaching and grip forces during grasping and lifting an object.

PMv lies beneath PMd. Given that PMv seems to be clearly tied to hand actions, it will be discussed in a later section.

Motor Regions along the Medial Wall of the Frontal Lobe

Numerous motor regions along the medial wall of the frontal lobe are also implicated in the modulation of motor cortex. The supplementary motor area (SMA, sometimes called SMA-proper), like premotor areas, has direct connections to both M1 and the spinal cord. The pre-SMA lies immediately anterior to the SMA (in fact, the anterior commissure, $y = 0$ in the Talairach system, is a useful reference point as the SMA lies posterior to it while the pre-SMA lies anterior to it). In contrast to SMA, pre-SMA has no direct connections to M1 and the spinal cord but has connections with prefrontal cortex. While SMA is more of a motor area, pre-SMA plays more of a cognitive role. Thus the medial areas show a similar organization as the lateral (premotor) regions of secondary motor cortex; namely more posterior divisions have more simple motor responses and direct connections with M1 while the more anterior divisions have more cognitive functions. Superior to the SMA in humans lies the supplementary eye fields (SEF; discussed in more detail below). Together these three regions can be thought of as the supplementary motor complex (SMC).

Whereas premotor cortex is involved in actions driven by external stimuli, SMA is thought to be more involved in initiating movement sequences. Patients who have SMA damage can make reflexive movements but cannot initiate voluntary movements. Intriguingly, some patients with lesions to the SMC may show alien-limb (or 'Dr Strangelove') syndrome in which it seems like "the hand has a mind of its own." These patients are compelled to perform actions such as grasping a tool in a functionally appropriate way; they cannot inhibit the action. Thus the SMC seems to be involved not just in initiating voluntary movements but also inhibiting them based on the situation.

Regions in the SMC are activated in anticipation of upcoming movements. PET studies in the 1980s showed that performing a simple hand action activated both M1 and SMA while rehearsing the movement without performing it activated only SMA. Activation in pre-SMA is stronger for actions initiated voluntarily than those initiated by an external stimulus. In addition, SMA is proposed to play a role in movement sequencing and coordinating actions between the two hands. TMS to SMA affects bimanual coordination. TMS to pre-SMA can disrupt participants' ability to do the right task when the instructions change or to veto an action that has been initiated.

Beneath the SMC, a complex of motor-related areas lies along the cingulate sulcus on the medial side of frontal cortex. Though subdivisions have been proposed, they have rarely been differentiated in human neuroimaging studies. Suggested functions for this cingulate zone (CZ) include roles in selecting actions and monitoring conflicts. As in premotor cortex, the cingulate zone is activated by tasks that involve conditional responses (such as the example of reactions to a traffic light).

Areas Involved in Hand Actions

Ventral Premotor Cortex

Ventral premotor cortex (PMv) is involved in controlling hand actions during object manipulation. For example, in a task such as grasping a coffee cup, the actor must use visual information about the cup to guide the hand and open the fingers to an appropriate size and posture. Once the hand contacts the cup, the actor must use the appropriate grip force depending on expectations regarding factors like the fullness of the cup. In neuroimaging studies, PMv is sometimes (but not always) activated in tasks such as grasping, object manipulation, and control of grip forces.

In the macaque brain, PMv contains 'mirror neurons,' which respond not only when the monkey itself performs a hand action (such as picking up a raisin), but also when it observes another individual performing that same hand action. Mirror neurons have been postulated to play a role in understanding others' actions, imitation and even empathy. Although neuroimaging studies cannot detect individual neurons, ample research has reported activation around PMv when participants watch videos of other individuals performing actions. Such research suggests that humans also have a 'mirror system.' In both humans and macaques, responses are stronger for goal-directed actions directed toward target objects (compared to actions without target objects). Despite many similarities between the human and macaque mirror systems, the existence of human mirror neurons per se – populations that respond to both execution and observation of the same action – has been somewhat controversial. Techniques (MVPA and fMRA) that have aimed to find common coding of specific actions during execution and observation have yielded equivocal results.

TMS to PMv affects participants' ability to grasp objects correctly. Consistent with the role of mirror neurons in PMv,

neurostimulation also affects discrimination of the action performed by an actor.

Anterior Intraparietal Sulcus

An area of the human anterior intraparietal sulcus (aIPS; thought to be equivalent to macaque area AIP) is reliably activated during fMRI studies of grasping. Typically aIPS is identified by a contrast between grasping (which requires both transporting the arm and forming a grip) and reaching (which requires only transporting the arm). Notably however, aIPS is activated even if the arm remains still but the hand grips (vs touches) an immediately adjacent object. aIPS responses are typically bilateral but stronger for grasping with the contralateral hand (e.g., left aIPS is activated more when the right hand is used than the left).

During delayed grasping, human aIPS (like macaque AIP) is activated during the visual presentation of a graspable object, the delay period and the period during which the grasp is performed (even in the dark). Within aIPS, there appears to be a gradient in which action execution and somatosensory feedback yield activation in anterior aIPS; whereas, the visual presentation of an object to be grasped yields activation in posterior aIPS. Posterior but not anterior aIPS is activated by viewing of tools (such as screwdrivers) to a greater degree than objects that are merely graspable (such as an apple). Moreover, aIPS is a multimodal area, responding to both vision and touch. In addition to grasp-selective responses, aIPS responds to the amount of grip force used by a participant during squeezing or lifting. It also responds during haptic manipulation of shape, more so for complex than simple objects.

Human fMRI has revealed many additional properties of human aIPS. aIPS is more strongly activated by precision grips (such as grasping a penny with the index finger and thumb) than whole-hand grasps (such as grasping a baseball). During action observation, aIPS appears to code the goal of an action (e.g., grasp the apple, regardless of whether it is on the left or the right) rather than the trajectory (e.g., grasp the object on the left, regardless of whether it is an apple). However, during action execution, aIPS codes both the object shape and the placement of the digits on the object. aIPS is also activated when subjects 'grasp' with a pair of tongs; however, in this case it appears to code the specifics of the grasp rather than the general goal of acquiring the target object. Processing of object shape alone appears to be insufficient to activate aIPS; specifically, judging the size of an object or pretending to grasp it yields little or no aIPS activation. Like PMv, human aIPS (and regions near macaque AIP) are activated during the observation of hand actions.

TMS to aIPS shows that it plays a key role in visually guided grasping performance. Specifically, TMS to aIPS affects participants' ability to use visual information to form an accurate grip and to adjust that grip if the object changes.

In the macaque brain, and presumably also in the human brain, aIPS gets input from a region in the caudal intraparietal sulcus (cIPS) and sends output to PMv. Neurons in both macaque and human cIPS are tuned for the orientation of an object. For example, one cIPS neuron may show the most vigorous response for a flat surface (like a dinner plate) with a particular orientation in 3D space (e.g., with the top receding in depth) while another neuron might show the most vigorous response for an elongated object with a different orientation in 3D space (e.g., a cylinder oriented horizontally). Thus it is thought that cIPS may do preliminary visual processing of object orientation that can be used to select the orientation of the hand to grip the object. Although a number of human neuroimaging studies have found regions in the intraparietal sulcus behind aIPS that show some of the properties of macaque cIPS, the anatomical location across different studies is so variable that there remains no consensus about a human homolog or its location.

Areas Involved in Arm Actions

Superior Parieto-Occipital Cortex, Precuneus, and mIPS

Several human brain areas have been implicated in reaching movements such as pushing an elevator button. One well-studied reach-related area is in superior parieto-occipital cortex (SPOC), although reach-related activation is also sometimes observed in the precuneus and medial intraparietal sulcus.

SPOC responds more to actions that require transporting the arm to a new location compared to actions that don't. However, arm transport is not strictly necessary as it can be activated even when the arm is used to indicate a distant location without reaching (such as pointing to an object beyond reach such as a star). As such, one likely account is that SPOC is particularly involved in coding target locations for the purpose of guiding hand actions. This area is also activated when fMRI participants plan a reaching action (vs an eye movement). It is only activated during reaching when the eyes are not looking directly at the reach target. As such, SPOC is thought to be involved in hand-eye coordination. Indeed, in one intriguing DTI study, participants who were trained to juggle showed training-related enhancements in white matter around SPOC.

SPOC has visual responses, particularly to large moving stimuli and responds more when the hand can be seen during reaching. SPOC also shows preferential responses to near space. That is, SPOC activity increases when participants are looking at near targets or when graspable objects are placed in near regions of space where grasping typically occurs. In addition, SPOC responses are stronger for reaches in the lower visual field, where hand actions typically occur.

In some studies, SPOC has been divided into anterior and posterior subdivisions (aSPOC and pSPOC). Based on a variety of functional similarities, aSPOC and pSPOC are thought to be equivalent to macaque regions V6A and V6, respectively. If that is indeed the case, pSPOC (V6) should serve more as a visual area that processes information in the visual periphery; whereas, aSPOC (V6A) should be more of a visuomotor area that uses visual information for reaching.

Activation for reaching and pointing tasks is also sometimes observed in the precuneus (regardless of whether the hand is seen, unlike SPOC) and medial intraparietal sulcus (mIPS; regardless of whether or not the person is looking directly at the target, unlike SPOC). Although many researchers have proposed homologies between human and macaque reaching areas, these proposals are still quite speculative. An area called

the parietal reach region (PRR) has been reported in the macaque brain and largely overlaps with a medial intraparietal area. However, different neuroimaging groups have used the PRR label to describe SPOC, precuneus and mIPS. Until stricter criteria for homologies are established, it is preferable to use labels that describe the anatomical location instead of proposed labels based on macaque functional areas.

Areas Involved in Eye Movements

Frontal Eye Fields

One of the most well-studied human brain areas involved in eye movements is the frontal eye fields (FEF). In humans, the FEF are much further back (at the junction of the superior frontal and precentral sulci) than in the macaque (in the arcuate sulcus). Although careful fMRI studies show that FEF is located below PMd, the areas are very close to one another and the vast majority of neuroimaging studies base area labels on expectations more than data. When fMRI uses spatial resolutions (~1 mm) finer than is typical (~3 mm), separate subdivisions of human FEF, like macaque FEF, are activated by saccades (abrupt shifts in gaze) and smooth pursuit of moving targets.

Parietal Eye Fields

Parietal activation is frequently observed for eye movements. Saccades are the most well-studied type of eye movement. The most common focus of activation for saccades falls along, and sometimes medial to, the intraparietal sulcus. Activation in this region is sometimes but not always seen to be stronger during the planning of eye movements compared to arm movements. This region contains a 'saccadotopic' map of locations for planned eye movements. For example, part of the parietal eye field (PEF) in the left hemisphere will be activated when a saccade is planned to the 2 o'clock position and this part will be between those activated when saccades are planned to the 1 and 3 o'clock positions. Originally the first parietal map that was discovered was thought to be the human equivalent of the macaque LIP (though multiple topographic maps have now been identified along the intraparietal sulcus). Given that in humans, the activation tends to be more medial than lateral and that homologies are quite speculative, here the label PEF is preferred.

Supplementary Eye Fields

The SEFs lie on the medial wall of the cortical surface, just above the SMA. The function of the SEF is not as well understood as other cortical regions involved in eye movements. However, some evidence suggests the SEF are involved in resolving conflicts between saccade targets.

Areas Involved in Head Movements

Ventral Intraparietal Sulcus

Macaque neurophysiology has revealed an area in the ventral intraparietal sulcus (VIP) that appears to be involved in moving the head. Stimulation to macaque VIP evokes defensive movements such as ducking the head. VIP also responds to the sense of motion (through vision, touch or hearing), particularly near the head.

Investigations of the human ventral intraparietal sulcus (vIPS) have been relatively rare due to the difficulty of allowing head movements with fMRI. Nevertheless human vIPS does display some similarities to macaque VIP, including activation to motion from different senses.

Neuroimaging Studies of Connectivity

Neuroimaging studies suggest that the anatomical and functional connections between brain regions in humans are similar to those of NHPs. Anatomically, DTI tractography can identify the corticospinal tracts descending from M1 and can even resolve fibers from M1 zones that control different body parts. RSC studies have also revealed other functional connections. In particular, even at rest, left and right M1 show strongly correlated activity, suggesting strong interhemispheric connections.

DTI tractography and RSC have also revealed expected connections between cortical association areas in humans. These include connections between aIPS and PMv and between mIPS and PMd. One study used TMS to stimulate human M1 or PMd while recording PET activation throughout the brain. TMS to M1 affected PET activation in secondary motor areas and subcortical areas. In contrast, TMS to PMd affected PET activation in other secondary motor areas (including PMv), parietal cortex (including aIPS and mIPS) and prefrontal cortex.

TMS studies have also revealed connections among the key cortical areas involved in actions. One useful approach is dual-site TMS in which a premotor or parietal area is stimulated several milliseconds before motor cortex to evaluate the effects of interactions between areas upon muscle responses (motor-evoked potentials). Dual-site studies have corroborated the existence of a PMd-M1 network involved selecting an appropriate response. They have also shown that aIPS-PMv-M1 network is involved in preparing the hand to grasp a visible object and that this effect depends on the type of grasp planned (precision vs whole-hand grasp). Furthermore, they have supported the hypothesis that SPOC-M1 interactions are implicated in arm transport while aIPS-M1 interactions are implemented in grip.

Summary and General Organizational Principles

Given the plethora of specific cortical regions implicated in movement control, it may be helpful to consider the general organizational principles that govern their anatomical and functional arrangement.

Although premotor and parietal cortices have been viewed as a mosaic of specialized areas, another view suggests that they have a general organization that accounts for why specific functions are performed at specific locations on the cortical sheet. Brain organization can be simplified by understanding a few core principles. One principle is that "neurons that fire together wire together"; put another way, connections form between regions that share information processing. A second principle is that the wires (axons of neurons) should be as short

as possible. One outcome of these principles is that the cortex often contains maps that enable, in this case, adjacent parts of the body to be represented in adjacent parts of the cortex. Another outcome is that adjacent maps (in adjacent areas) are often mirror images. These organizational principles have been well established in sensory systems; however, more recently, they are being applied to understand motor systems as well.

Of course, the most obvious motor-related map is the body map seen in M1 and S1; however, this body map also accounts for some organization of premotor and parietal cortex, albeit more coarsely. In one fMRI experiment, participants watched movies of people performing actions with the foot, hand or mouth. Activation for hand actions was found around aIPS, while activation for observing foot actions was higher up and activation for mouth actions was lower down. A similar organization of activation was found in premotor cortex.

According to one view, premotor cortex may be part of a two-dimensional sheet (if one imagines unfolding the cortex and laying it flat) that represents not just the body map but also aspects of the most common real-world behaviors. Work by Michael Graziano (2008) and his colleagues has shown that strong electrical stimulation to various zones of macaque premotor cortex (PMC) evokes highly specific movement patterns. Stimulation at the top of PMC evokes climbing behaviors (in the PMC area adjacent to the M1 representation of the limbs). Stimulation lower down evokes grasping behaviors (in the PMC area adjacent to the M1 representation of the hands). Even lower stimulation evokes defensive movements to protect the head and feeding behavior (in the PMC area adjacent to the M1 representation of the head and mouth). Thus it seems there is a topography in PMC that reflects the fundamental motor behaviors associated with various body parts, paralleling the arrangement in M1. However, the mapping of body parts may not be the only feature that affects premotor organization. For example within the zone of PMC that evoked grasping actions, stimulation to adjacent regions led the monkey to reach and grasp to specific regions of space.

Taken together, this data and model suggest that cortical regions surrounding M1 – PMC and PPC – are organized along an up-down (superior–inferior) dimension that reflects body parts and the most common behaviors they subserve in natural settings.

In addition, the cortical areas subserving actions also have a front-back (anterior-posterior) organization with motor cortex at the crux. The parietal lobes are positioned between motor cortex and sensory cortex that processes vision, touch and hearing. Indeed there seems to be a gradient within PPC, with more anterior zones having strong somatosensory and motor responses and more posterior zones having strong visual responses. The PMC is positioned between prefrontal cortex and motor cortex and acts as a 'liaison' between executive decisions and their execution. Some have suggested a broader organization for a wide range of parietal and frontal regions involved not just in motor control but other cognitive functions like attention, calculation and language. Specifically, the proposal is that frontal and parietal regions form a mirror symmetric arrangement reflected across M1/S1. For example, in frontal cortex, areas involved in language tasks are in front of areas recruited by mathematical calculation tasks whereas in parietal cortex, they are behind forming a 'palindromic' arrangement indicative of mirror reflections that can yield efficient wiring in the folded brain.

In sum, motor cortex is thus optimally located to receive bottom-up sensory input (from parietal cortex), top-down executive input (from premotor and prefrontal cortex), and send the output to the two modulatory loops (through the basal ganglia and cerebellum) for feedback before directing the motor commands to the muscles via the spinal cord. There may be at least two fundamental organizational principles for parietofrontal cortex: a top-bottom (dorsal–ventral) arrangement related to body parts and the ecological functions they subserve and a back–middle–front (posterior–central sulcus–anterior) arrangement related to sensory–motor–cognitive processing (and perhaps including other cognitive functions beyond motor control).

Cortical Development: Transplantation and Rewiring Studies

Mriganka Sur, Massachusetts Institute of Technology, Cambridge, MA, USA

© 2015 Elsevier Ltd. All rights reserved.

Abstract

The cerebral cortex is formed by discrete functional subregions that have distinct patterns of connections, cell types, and molecular organization. These distinct properties allow the subregions to perform distinct functions. During development, the unique projections and neural activity act to shape fundamental properties of areal organization. Perturbation of these projects can profoundly alter both the organization and function of cortical regions. Such changes can be induced by transplanting one developing cortical patch to another region, surgically induced rewiring of the developing cortex, or more naturally by auditory or visual deprivation in development.

The development of the mammalian neocortex involves the formation of many discrete areas that process different kinds of information uniquely. Individual areas are characterized by specific sets of inputs, processing networks, and outputs. The development of these features involves factors that are intrinsic to the tissue, or are regulated by extrinsic or environmental influences. Transplanting one region of cortex to another at particular times in development, or rewiring inputs to a part of the cortex, provides fundamental information on developmental mechanisms of the cortex. Such studies demonstrate that the features that make a cortical area unique are expressed progressively as development proceeds. Importantly, they show that electrical activity can have an instructive role during the development of cortical networks, so that specific spatial and temporal patterns of activity regulate specific patterns of connections between cortical neurons. The mammalian neocortex, a folded sheet that in humans contains over 10 billion neurons, is the seat of the most complex sensory, motor, and cognitive abilities. Cortical development involves the formation of many discrete areas that uniquely process different kinds of information. Individual areas are characterized by specific sets of inputs, processing networks, and outputs. The development of these features involves factors that are intrinsic to the tissue or are regulated by extrinsic or environmental influences. This article examines the relative roles of such influences, employing in particular evidence from experiments that have probed developmental mechanisms by transplanting cortical regions or by rewiring inputs to a part of the cortex.

Development of the Cortex

The principal method for studying mechanisms of development is to manipulate developmental processes. In general, it is not possible to separate intrinsic cleanly from extrinsic aspects of developmental programs of an organism: No gene acts independently of an environment, and the environment always acts on a scaffold. A classic paradigm in developmental biology for clarifying the role of the local environment in determining the features of a tissue is to translocate the tissue to a novel environment. Transplanting one part of the mammalian cortex to another at different stages of development has been a valuable tool for determining whether or not unique features of a cortical area derive from intrinsic properties of the cortex, or are induced by new inputs in the host environment. A powerful recent method that complements transplantation studies is to route sensory inputs that normally drive one part of the cortex to another part. Thus, instead of altering the location of a target and preserving host inputs, the inputs to existing targets are altered. Together, these studies demonstrate that the features that make a cortical area unique are expressed progressively as development proceeds. Importantly, they show that electrical activity can have an instructive role during the development of cortical networks, so that specific spatial and temporal patterns of activity regulate specific patterns of connections between cortical neurons.

Formation of Cortical Layers

The adult mammalian neocortex consists of six layers. These are generated by a heterogeneous population of precursor cells that lie along the walls of the lateral ventricles very early in development. The time of neurogenesis in the ventricular zone regulates the final disposition of cells in individual layers. Cells that are born earlier form the deeper cortical layers, whereas later-born cells form the progressively more superficial layers. Transplantation experiments have shown that there is a progressive restriction of cell fate in the precursor population: Early progenitors are able to give rise to neurons which come to reside in any cortical layer, whereas later progenitors give rise only to neurons of more superficial layers.

One key set of experiments (McConnell and Kaznowski, 1991) demonstrates that transplanting neurons from the ventricular zone of a donor animal at an age when layer 6 is being born, into a host in which layer 2/3 is being born, causes the donor cells to settle into either host-specific layer 2/3 or donor-specific layer 6, depending on the stage of the cell cycle at which donor cells are extracted. If donor cells are extracted prior to or during the phase of DNA synthesis, they are able to switch their fate and migrate to the layer that is being generated in the host (layer 2/3), due presumably to environmental cues in the host. If donor cells are extracted later in the cell cycle, their fate is sealed prior to transplantation and they settle into the layer determined in the donor (layer six). The precise

 http://dx.doi.org/10.1016/B978-0-08-097086-8.55014-4

nature of extrinsic signals that determines or alters the laminar fate of newborn cells during a certain part of the cell cycle is unknown.

Events occurring at the ventricular zone can contribute in other ways to regional differences in cortical architecture. The dynamics of the cell cycle show regional variation. Most notably, the germinal zone of the primary visual cortex (V1) of primates, a region with twice the neuronal density of other areas, has a notably higher rate of cell production which is associated with changes in the parameters of the cell cycle. Thalamic afferents can exert a mitogenic effect on cortical progenitors, resulting in an increase in the number of cell divisions. Thus, thalamic inputs are one important source of extrinsic influences on cortical development, starting with the cell cycle and lamina formation.

Formation of Cortical Areas

There is considerable evidence suggesting that at least the initial broad parcellation of the cortex into discrete areas is regulated by molecular determinants that are intrinsic to the proliferative zone of the developing cortex. For example, evidence from transplantation and coculture studies suggests that the initial expression of region-specific markers or phenotypes is not dependent on specific thalamic innervation. A number of genes are expressed differentially between cortical areas before thalamic afferents are believed to have invaded the cortical plate. Similarly, the expression of several genes can occur normally even in the absence of thalamocortical innervation. Finally, gradients of gene expression in the early cortex can regulate initial cortical parcellation, and such genes can also serve to attract appropriate sets of inputs from the thalamus, or direct appropriate outputs from the cortex (Rubenstein and Rakic, 1999).

While the expression of genes and molecules may delineate broad areas of cortex at very early stages of development, subsequently thalamic afferents can influence the size and even the identity of specific areas (O'Leary et al., 1994). Transplants of extremely immature cortex – at embryonic day (E)12 in rats – from the limbic to the somatosensory cortex may take on inputs and express molecules characteristic of the host region rather than the region of origin. This ability is lost if the transplants are derived at a later developmental stage. Transplanting visual cortex into somatosensory cortex in rats causes the graft to accept inputs from the somatosensory thalamus and form 'barrels,' a characteristic of the rodent somatosensory cortex. Other work shows that the transplant needs to occur early, before E16, for the graft to form substantial connections with the somatosensory thalamus, and later grafts are already committed to form connections with the visual thalamus. With respect to output connections, occipital to frontal transplants at E12 can form projections to the spinal cord, a characteristic of the host cortex rather than the donor; however, by E14 that capacity has been lost and projections to the tectum, a characteristic of the region of origin, are formed instead. Interestingly, a similar age-dependent switch between E12 and E14 influences the corticocortical connections made by transplanted perirhinal cortex into the parietal region. These findings indicate that there is an early time window during which the input and output connections of a cortical area may be sculpted by thalamic and local or regional signals to produce an area-specific phenotype. Thus, cortical areas arise by progressive specification of their region-specific phenotype from a multipotent phenotype (Levitt et al., 1997).

Formation of Cortical Networks: Ocular Dominance and Orientation Columns in Visual Cortex

The cortex differentiates progressively into layers, and as layer 4 appears in the cortical plate, thalamic innervation specifies the principal sensory areas. Concurrently, descending projections from the cortex innervate specific thalamic nuclei, primarily by the targeting of axons of layer 5 cells to principal and/or association nuclei, followed by the development of layer 6 projections to principal relay nuclei. Thus, a thalamocortical loop is set up very early in development, and the initial specification of cortical areas is fundamentally a specification of unique feedforward and feedback connections between thalamus and cortex. The development of intracortical circuitry follows thalamic innervation; considerable recent evidence, primarily from the visual cortex, demonstrates that a combination of intrinsic and extrinsic factors (such as electrical activity in thalamic inputs) is responsible for the formation and maintenance of specific thalamocortical and intracortical connections.

Ocular dominance columns – regions within layer 4 of V1 in higher mammals that receive input exclusively from one eye or the other via the lateral geniculate nucleus (LGN) of the visual thalamus – are paradigmatic of thalamocortical patterns that specify individual cortical areas. In primates they are present by birth, suggesting that visual experience is not required for their formation. Recent work suggests that they may also be set up before eye opening in ferrets, soon after geniculocortical axons innervate layer 4 (Crowley and Katz, 2000), and similarly in cats. Surprisingly, they may not even require the presence of the eyes for their initial establishment. Monocular enucleation does not degrade these early columns immediately, and binocular lid suture does not reduce their development in cats for the first 3 weeks. One possibility is that ocular dominance columns are set up initially by the molecular matching of inputs from different layers of the LGN (each layer representing a given eye) with appropriate target regions in V1.

An alternative view is that ocular dominance columns are set up by activity-based rules of development. Thus, if inputs from one eye are correlated with each other and uncorrelated with inputs from the other eye, application of a Hebbian developmental rule for strengthening connections (and of a complementary rule for weakening connections), together with local excitation and long-range inhibition in the cortex, can lead to cortical stripes that resemble ocular dominance columns. Correlated inputs in the form of spontaneous waves of activity exist in the retinae prior to eye opening. In the LGN, the firing of neurons within a given eye-specific layer is well correlated, and uncorrelated with the firing of neurons in an adjacent layer which represents the other eye. Interestingly, ablation of the cortex abolishes these correlations, whereas ablation of inputs from the eyes has little effect. The pattern of electrical activity

transferred to the cortex, therefore, appears to be regulated strongly by interactions between the thalamus and the cortex, and activity in the thalamocortical loop may be sufficient for eye-specific patterning. Significant support for the hypothesis that ocular dominance columns can arise, at least in principle, by activity-dependent sorting of inputs comes from the finding that eye-specific stripes form in the optic tectum of 'three-eyed' frogs forced to receive input from two eyes (Law and Constantine-Paton, 1981). Whether or not ocular dominance columns in V1 require electrical activity to instruct their formation, there is convincing evidence that electrical activity is required to maintain them (Sherman and Spear, 1982).

Orientation selectivity is a major emergent property in visual cortex that is created by aligned thalamic inputs whose activity is amplified by local intracortical connections. Orientation selectivity is present in V1 of primates at birth, and to a degree in cats and ferrets at or before the time of natural eye opening, although selectivity increases with visual experience (Chapman et al., 1999). Orientation-selective cells in visual cortex are linked by long-range horizontal intracortical connections in the superficial layers to form an orientation map. The adult pattern of clustered horizontal connections is present at birth in primates. In cats and ferrets, crude clusters appear just prior to eye opening, and are refined after the onset of vision; binocular deprivation prevents this refinement. The orientation map, revealed by optical imaging of intrinsic signals, develops in parallel with the development of orientation selectivity in single cells.

Monocular lid suture after orientation maps have already formed disrupts the map from the closed eye; reverse lid suture restores the map precisely. In addition, matching orientation maps for the two eyes develop even in cats raised under an alternating-suture paradigm, so that the two eyes never have common visual experience. Together, these studies indicate that the emergence of orientation-selective responses in single cells and the overall layout of the orientation map do not require patterned vision, although visual experience is necessary for orientation selectivity and maps to fully mature. However, blocking electrical activity in V1 reduces both the orientation tuning of single cells and the clustering of horizontal connections. Thus, spontaneous electrical activity in cortex or in the thalamocortical loop is required for the initial establishment of local and long-range intracortical connections.

Patterned Electrical Activity and the Development of Cortical Networks

The vast majority of experiments on the influence of activity on visual cortical networks have involved manipulations such as lid suture or activity blockade that alter the amount of activity in the visual pathway. Relatively few experiments have examined the influence of the pattern of activity on cortical network development and maintenance; such manipulations include artificial strabismus, specific rearing paradigms, and rewiring of visual projections to the auditory pathway.

Strabismus refers to misalignment of the two eyes' optical axes, so that activity from corresponding retinal loci in the two eyes are no longer temporally correlated. Artificially induced strabismus causes neurons in V1 to become almost exclusively monocular, and ocular dominance columns to be more sharply delineated and have altered spacing compared to normal animals. Long-range horizontal connections within the superficial layers of V1 are also affected. In normal cats these connections cluster to link regions with similar orientation preference but do not align with ocular dominance columns, whereas in strabismic cats the connections come to link columns with similar eye dominance and orientation preference (Schmidt et al., 1999). Thus, correlations in input activity are used to sharpen and organize ocular dominance columns, and to shape intracortical horizontal connections.

Rearing kittens in a visual environment consisting of alternating black and white stripes at specific orientations restricts pattern vision and appears to shift the orientation preference of cortical cells toward the experienced orientation. While a shift could be caused by a passive loss of responses to nonexperienced orientations, there is an expansion of cortical columns devoted to the experienced orientation (Sengpiel et al., 1999), indicating an instructive effect of patterned visual experience on orientation selectivity and the orientation map.

Rewiring the Cortex

A unique paradigm for investigating the role of patterned afferent activity in the development of cortical circuitry and function is experimentally to redirect afferents carrying information about one sensory modality to central targets and pathways that normally process a different sensory modality (Schneider, 1973). Retinal axons can be induced to innervate the auditory thalamus in the ferret (Sur et al., 1988), a carnivore with a highly organized visual pathway and which is born at a very early stage in development. The routing of retinal projections to the auditory pathway can be induced at birth, allowing the probing of the role of patterned activity in the establishment (and not simply the maintenance) of cortical circuitry. Importantly, visual input is relayed from the auditory thalamus to the primary auditory cortex (A1) via thalamocortical projections whose physical identity is unchanged but which provide spatiotemporal patterns of electrical activity to the auditory cortex that are very different from normal (**Figure 1**).

Visual driving leads to emergent responses in 'rewired' A1 that demonstrate the role of patterned activity in shaping cortical networks. An orderly two-dimensional retinotopic map develops in A1 of rewired ferrets, in cortex that normally maps a one-dimensional surface, the cochlea. The retinotopic map in rewired A1 arises despite widely dispersed and overlapping thalamocortical projections, suggesting that well-localized receptive fields and their orderly progression are created by correlation-based mechanisms that operate intracortically to select and strengthen a specific subset of synapses from a broader set available anatomically.

Visual cells in rewired A1 have orientation-tuning, direction-tuning, and velocity-tuning properties that are quantitatively indistinguishable from V1 cells, suggesting that similar mechanisms operate in the generation of receptive field properties in the two cortices. Orientation-tuned neurons in A1 are organized into an orientation map that resembles in important respects the map in V1 (Sharma et al., 2000). The differences between orientation maps in V1 and rewired A1 reflect

Figure 1 Retinal inputs routed to the auditory thalamus in rewired ferrets drive the auditory cortex with visual activity without altering thalamocortical projections. (a) Visual and auditory pathways in normal ferrets. The retina projects predominantly to the lateral geniculate nucleus (LGN) and superior colliculus. The LGN projects to the primary visual cortex. The medial geniculate nucleus (MGN) receives most of its subcortical afferents from the ipsilateral inferior colliculus, although afferent projections also arise from the contralateral inferior colliculus. The MGN projects to the primary auditory cortex. (b) Visual pathways in rewired ferrets. Subcortical inputs to the MGN in one hemisphere are removed in early postnatal ferrets. This induces retinal axons to innervate the deafferented MGN. The MGN still projects to the primary auditory cortex, as in normal ferrets, but in rewired ferrets it relays visual rather than auditory inputs. This change in spatiotemporal patterns of input activity early in development has a profound effect on networks in auditory cortex, and on its function. Adapted from Angelucci, A., Sharma, J., Sur, M., 2000. The modifiability of neocortical connections and function during development. In: Kaas, J.H. (Ed.), The Mutable Brain, Harwood, Amsterdam.

differences in the underlying organization of superficial-layer long-range horizontal connections in these two cortices. In V1, horizontal connections are patchy, spatially periodic, and extend mediolaterally. In contrast, horizontal connections in normal A1 are more band-like in organization, show little spatial periodicity, and are anisotropic anteroposteriorly. Horizontal connections in rewired A1 show features that are intermediate between V1 and normal A1: The connections in rewired A1 form much smaller and more regular patches than in normal A1, though the patches are less tightly clustered and are larger in size than in V1. Thus, horizontal connections within the rewired cortex are significantly altered by visual input, but in a manner that appears to be constrained by intrinsic features of the auditory cortex (see also Majewska and Sur, 2006).

Rewired ferrets also provide an opportunity for examining whether the behavioral role of a cortical area is set by intrinsic determinants or by the pattern of afferent activity during development. Behavioral experiments, supported by several kinds of control experiments, indicate that rewired ferrets interpret visual stimuli which activate the rewired projection as visual rather than as auditory (von Melchner et al., 2000). Thus, the function of a cortical area is dependent fundamentally on the spatiotemporal pattern of activity it receives during development. It is possible that all 'auditory' pathways central to the thalamus in the rewired hemisphere are turned 'visual,' including the cortex and downstream structures, with a concomitant respecification of their perceptual identity.

The rewiring studies are not unique to ferrets as similar results have been shown in hamsters (Frost et al., 2000), although the neurophysiological properties of the A1 neurons appear more similar to V1 cells in the hamsters (Ptito et al., 2001). In addition, some of the visually responsive cells in A1 are bimodal – they can respond to both visual and auditory stimuli.

Rewiring does not require surgical intervention as in the ferret and hamster studies but can also occur naturally in conditions such as congenital deafness (e.g., Barone et al., 2013; Butler and Lomber, 2013). In addition, it has been shown that the visual cortex can respond to nonvisual input in individuals with visual deprivation (e.g., Bedny et al., 2012).

Cortical development involves a progressive shaping of the fate of the cortical epithelium into discrete cortical areas with specific inputs, outputs, and local networks. Developmental manipulations, which include, importantly, transplantation and rewiring studies, demonstrate a continual interplay of intrinsic and extrinsic factors at all stages of development – at the ventricular zone during the cell cycle, in the cortical plate during the parcellation of cortical areas, and within the cortex during the formation and maintenance of cortical networks. The nature of extrinsic signals varies with developmental time, and likely includes intercellular signals in the ventricular zone that influence the formation of layers, trophic or permissive electrical signals in early area formation, and instructive electrical signals in late network development, which persist into adulthood as substrates for learning and memory.

Abstract

Lewis A. Coser (1913–2003) was a leading figure in American sociology in the second half of the twentieth century. Born in Germany, he fled to Paris in 1933 and later to the United States in 1941, where he met his future wife and fellow sociologist, Rose Laub Coser. He gained recognition with his first book, *The Functions of Social Conflict* (1956), as well as for later work on the political role of the intellectual and his influential textbooks. Coser also maintained a career as a socialist intellectual, primarily through *Dissent*, the journal he cofounded with longtime collaborator Irving Howe.

Ludwig Cohn, 1913–33

The man who would become Lewis Coser was born in Berlin in 1913. His father was a banker and broker with the surname Cohn. He was Jewish but as Coser later recalled, "blue-eyed and blond … more German than most Germans" (Rosenberg, 1984). The elder Cohn was partly assimilated, quite patriotic, and though his closest friends were fellow Jews, he had married a Protestant woman from a lower-class family. A son was born 27 November 1913 and named Ludwig Cohn; and at some point, a daughter was added to the family. The family fortunes continually improved and while still a boy Ludwig Cohn moved with parents and sister to a 150-acre estate in Charlottenburg, where his father "play[ed] the highly respected lord" (Rosenberg, 1984) (Biographical details of Coser's life are taken from the following sources, which are drawn upon throughout this article: Coser's (1993) autobiographic essay for ARS; Powell and Robbins's (1984) essay in the *Festschrift*; Rosenberg's (1984) interview with Coser in the *Festschrift*; Coser's (1988) introduction to a collection of his papers; his New York Times obituary (Martin, 2003); an obituary by Stephen Kalberg (2004); and an obituary in *Dissent* (Rule, 2003). Some additional details are drawn from the reminiscences of Coser published in *Footnotes*, including those of Judith Blau, Donna Gaines, Bill Gamson, Stephen Kalberg, Donald N. Levine, Aldon Morris, Steven Nock, Walter W. Powell, Philip Selznick, Barrie Thorne, and Eviatar Zerubavel. Invaluable assistance was offered by Coser's students Walter W. Powell and Stephen Kalberg. Additionally, it should be noted that Coser's son Stephen compiled an excellent bibliography of his father's works in the *Festschrift*, although this extends only to 1983.)

The banker Cohn ultimately made the decision to push his children further along the road of assimilation, and changed their surname to Coser. A stern disciplinarian with bourgeois attitudes and aristocratic pretentions, the father disappointed the son. Coser later recalled, "whatever I became was partly a reaction to that" (Rosenberg, 1984). The reaction took the form of political activism: Ludwig Coser became intensely involved in German socialist circles and soon found confirmation for his rejection of paternal values in the excesses of the Weimar Republic. Politics continued to drive father and son apart, while Ludwig's sister moved to Shanghai with a new husband. The parents soon separated.

In 1933, Hindenburg appointed Hitler as the Reich Chancellor and Ludwig Coser was warned that his socialist activism had made him a target. He fled to Paris after a brief period studying in England but his father, disdaining his son's socialist politics, soon cut off the stream of money. Coser was broke, and "lived miserably, starving for a while" (Rosenberg, 1984). Down and out, nursing drinks at cafes, and secretly reading through the wares at bookstores, Coser found himself in a liminal class of refugee intellectuals simmering in the poor places of Paris.

Refugee in Paris, 1933–41

A work permit did eventually arrive and with a stroke of luck led to an interview to work as the assistant to the Swiss author Ludwig Bauer, who was then beginning research for a biography of King Leopold. Coser landed the job and although it paid well, Coser soon ran through his savings and was once again down and out in Paris. Later, he found work at an American brokerage house and literary work with André Gide (Additional information for this section was drawn from Jacoby (1984).)

Throughout this period, Coser's work had little to do with his true passion, which was to live as an organic intellectual, contributing his full mental efforts to establishing socialism as a global political project. Coser worked his way through the feuding socialist sects, subjecting again and again their schismatic doctrines to systematic interrogation, only to find them wanting. He flirted with Communist orthodoxy and was at least acquainted with the apologia for Stalin's dictatorship, but found himself with a deepening suspicion of empowered bureaucracies. A chance discovery of a library of French Revolutionary material with his friend Henry Jacoby, further set him along a path of critical, democratic socialism, and away from the Comintern.

Through free classes at the Sorbonne, Coser was exposed to an academic base for his intellectual pursuits. He achieved enough success that he could consider an advanced degree in comparative literature, looking to novels as a means of understanding English and German social structures. His advisor's reaction led him to switch to sociology and Coser would remain committed to this discipline (in addition, however, to his socialist work) for the rest of his life.

Sociology at the Sorbonne was then dominated by Célestin Bouglé, who hewed closely to a doctrinaire form of Durkheimianism which included rote memorization of the master's texts. Although in close proximity to many leading European sociologists, Coser's engagement with academic sociology remained constrained at this point; the Sorbonne sociologists were little interested in Weber, Simmel, or even Marx. While the academic arena offered structure and the hope of employment, it was the local discussion groups and tiny sects (many with their own journals) that offered Coser the bulk of his intellectual stimulation.

For some time after the outbreak of war, Coser seems to have been unaffected by the suffering felt throughout Europe. Coser knew that his father had left Germany to join his sister in Shanghai (his mother's fate is uncertain). Coser himself had adopted a pacifist position and remained well behind the lines. By the mid 1930s, he spoke perfect French, was deeply engaged in antifascist political movements, and so may well have had reason to think that he was something other than a 'Boche' to his neighbors. This notion was dispelled when French authorities rounded him up with the other German émigrés.

Various detainments and humiliations would follow. In his seventies, he could recall vividly a night spent in a sports arena with other detainees, expecting to be gassed: "one guy went mad and screamed throughout the night. I can still hear that" (Rosenberg, 1984). And yet, the worst did not happen. Through resourcefulness, through reliance on an extensive network of friends, and of course through good fortune, Coser received a coveted exit visa, secured passage across the Atlantic, and found himself in New York City.

A Second Refuge, 1941–51

The 28-year-old Ludwig Coser who arrived in the United States was a committed democratic socialist, had extensive experience as partisan and organic intellectual, and had trained for several years in Durkheimian sociology. Over the next 10 years, he was to rerun each of these aspects of his life in this second refuge, a refuge where, on the advice of an immigration official, he took on a new name, Lewis; or, to his friends, Lew. (Additional information for this section is drawn from Jumonville (1990) and Rodden (2004).)

Lewis Coser began his life in the United States on a promising note. His caseworker with the International Relief Association was the very intelligent and politically engaged Rose Laub (herself an émigrée), who would connect him to young New York Trotskyists, including Dwight Macdonald, Seymour Lipset, Daniel Bell, and Irving Howe, with whom he began to work through the socialist factions in New York. He also soon found steady employment, first as a freight handler and later for the Department of War in a variety of menial roles. Wary of causing problems with his government employer, Coser took on the pen name Louis Clair and began publishing in literary journals (*The Call, Challenge, Forum, Partisan Review, Politics, and Socialist Review*). As Louis Clair, Coser expounded a political vision that reflected his preferred Schachtmanite concepts and contributed to Max Schachtman's notion of a Third Camp (a variation of Trostky's Common Front that seemed to address Coser's concerns from his Paris days).

From a chance reacquaintance at a Schachtmanite party, Coser and Rose Laub were soon living together and they married. The birth of their first child eventually lead Rose Coser to study under Robert Merton at Columbia University. In 1948, Lewis Coser was 35, had a wife and child, and had defined a political position within the Schachtmanite camp. Later in life, Coser recalled: "Rose and I talked one day about one of our friends who had gotten a job teaching German at a little college. We said to each other, 'Do you think we might possibly achieve something like that?'" (Rosenberg, 1984). With this modest goal in mind, he followed Rose as a PhD student of Merton and Robert Lynd in the sociology department at Columbia.

Coser enrolled at Columbia and began to commit himself to a life both as an independent intellectual and an academic sociologist. Before he could begin, however, he received the surprising offer to teach at the University of Chicago, recruited by David Riesman as part of an expansion effort. In Chicago the Cosers found themselves in an exceedingly rich intellectual environment, which Coser would later describe as a "surfeit of honey" (Coser, 1993). Rose began to assist Riesman in his research for *The Lonely Crowd* while Lewis continued his studies at Columbia by distance, taught at Chicago, and learned some hard lessons in departmental politics.

The Frontiers of Structural Functionalism, 1951–54

The Chicago sojourn came to an end and the Cosers returned to New York, where they found that Columbia was also undergoing an intellectual rejuvenation. Finally dedicating himself full time to his studies, Coser was struck by the feeling that he was "working at the frontiers of sociology," noting later that it was "a joy to be alive in the Columbia atmosphere in the late 1940s and early 1950s" (Coser, 1993).

Coser is perhaps best known today as a precursor of the broad rejection of Parsonian functionalism's dominant place in the academy. The experience in Chicago had awakened both Cosers to the breadth of American sociology and their positive view of sociology was further confirmed by Merton, whom both quickly befriended. Rose found a mentor and intellectual interlocutor in Merton whom she would follow for much of her career. Lewis's connection to Merton was also deep; but his response to Merton's influence would be one of creative synthesis rather than intellectual indebtedness.

At the time, Merton was given a free hand by his colleagues in guiding the department and he set his sights on turning it into a home for structural functionalism. His approach was deeply indebted to his mentor Talcott Parsons but stressed new methods, a wide reading in the history of sociology, and dedicated engagement with theoretical issues. Thus, the functionalism Coser encountered at Columbia was already a reform version, one generation removed from Parsons.

While Parsons's star had already begun to dip, Coser retained a great deal from this first generation of structural functionalist thought. Coser noted later in life, "I had enormous respect for [Parsons] and had no sympathy for many of his critics who attempted to picture him as a reactionary servant of the American power elite" (Coser, 1993). He instead viewed Parsons as a classic reform liberal,

blinded perhaps by too much faith in stability yet brilliant nonetheless.

It was nevertheless a contentious intellectual kinship. One of Coser's first publications under his own (American) name was a review of Parsons's *Essays in Sociological Theory*. This collection was significant for Parsons since it represented the first attempt to integrate psychology into his framework, a move that would come to dominate his thinking. Coser criticized the move soundly by noting that "functional analysis becomes ideology – the ideology of Candide. … [This] leads to a basically conservative interpretation of functionalism which is not necessarily inherent in the theory as such" (Coser, 1950). In a section where Parsons defends the use of propaganda, Coser accuses him of "advocating manipulation and a sort of intellectual rape" (Coser, 1950). This review in the *American Journal of Sociology* is a remarkable case of a graduate student savaging the foremost sociologist in the country – an appropriate representation of Coser's intellectual independence.

Functions and Academic Success, *c.*1954

Coser's initial idea for his dissertation was an intellectual biography of Georg Simmel whose work had been pushed to the side in the wake of the rising Parsonian orthodoxy (Jaworsky, 1997). Merton disliked the dissertation idea, leading Coser to shift the project to become an extended engagement with Simmel's *Conflict*. This plan was accepted by Merton and the result would become Coser's breakthrough work, *The Functions of Social Conflict*.

At an early point Coser's dissertation began to spread beyond Simmel to encompass the concept of conflict in early American sociology. He found that American sociologists stand in a long tradition of liberal advocacy and reform, much more directly so than German and French sociologists. Indeed, the original audience for American sociological research came from the reformers at the University of Chicago, which allowed early reformer-sociologists like Robert Park the resources needed for systematic work in the city of Chicago. Coser argued that Park and his colleagues placed conflict at the forefront of both sociological theory and sociological work, working from an understanding that conflict had both positive and negative qualities. Even partial reformers such as Sumner or Giddings had a clear understanding of the importance and duality of conflict, although they were more inclined to stress the negative aspects than the positive.

Coser's review of Parsons in the *American Journal of Sociology* anticipated the first part of his dissertation where he argued that the institutionalization of sociology by figures such as Parsons at Harvard had diminished the place of conflict and reform in sociology. This loss led to an unnecessary tendency among functionalists to focus on stability and continuity rather than change and disruption. For Coser, perhaps the single greatest intellectual cost of this conservative drift was the loss of the recognition of the possibility of things improving through conflict and the tendency of conflicts to generate coordination, solidarity, and integration.

The first part of Coser's dissertation armed him with considerable resources in his critique of existing structural functionalist thought. He would draw on the classics to reform the orthodoxy of his day. Coser considered Simmel's work to have most clearly articulated the importance of conflict in social life and so the second part of his dissertation focused entirely on its explication and has come to define Coser's theory of conflict.

Although at times adopting Simmel's style, Coser departs significantly from Simmel's propositions by twisting the very word 'conflict' to cover a broader range of social acts than was generally the case, particularly to include ideational states such as 'dissent' (Cuber, 1957). Indeed, Coser, following Weber more than any American precursor, was eager to capture a richer sense of the culture-infusing nature of conflict than the more formal model offered by Simmel.

Coser's major contributions to the theory of conflict are threefold. First, he introduces the distinction between realist and nonrealist conflict. Realistic conflicts use conflict as a means to achieve some goal. Nonrealistic conflicts posit conflict itself as an end, sometimes as the result of losing sight of original objectives or often through interested parties, eager to benefit from the side effects of conflict.

A second major insight is his refinement of the place of political ideology in conflict. Intellectuals enter here as key figures, since they are uniquely capable of defining objects of contestation. His insight is that collective action is easier to manage when there are objective elements of contestation.

A final major insight is again a sort of Weberian supplement to Simmel's model. While Simmel attempted to show continuity across levels of conflict, Coser stresses the important differences inherent in modern warfare, which involve both national ideologies and vastly more complex role differentiation and structural configurations. By doing so, Coser folded the meso-level of organization into the study of conflict, in a way that Simmel had resisted.

Coser's dissertation allowed him to synthesize his long-term commitment to radical politics with his own growing investment in the United States as a relatively stable political entity, where he would raise his children and find security as a semiautonomous intellectual. He could now look at liberals like Parsons not as enemies rejecting social change but as potential allies able to reach back to a long tradition of reform. He could look to socialism as a project ever in the making, an endless campaign against injustice and ignorance waged by intellectuals within the very system they sought to change.

Dissent and Intellectual Success, *c.*1954

Coser's first book, so important for his intellectual development, received mostly positive reviews but at first did little for his academic career. This was beside the point, however, since his secondary Columbia advisor, Robert Lynd, recommended Coser for a position at Brandeis University. Rose found work at Northeastern University, so the move made sense. Brandeis was then a new experiment without traditional academic divisions. At first Coser was alone, free to teach what he wanted and burdened with few administrative duties; but he soon discovered that the lack of structure created difficulties in recruiting other sociologists. The environment at Brandeis was "stimulating," Coser recalled later, but in the words of Irving

Howe, it was a "lively, irreverent, not-very-academic atmosphere" (Howe). The outcome was that Coser was again drifting more toward the role of engaged intellectual than to the academic side of his twin careers (Additional information for this section is taken from Howe (1984).)

For many years, Coser and Irving Howe had shared an intellectual network without becoming close friends. Both were reformed Schachtmanites and both contributed extensively to literary journals; but while Coser began finding moderate success in his secondary career as an academic, Howe had remained an unattached professional writer and intellectual. Shortly after the Cosers moved to the Boston area, Howe decided to pay them a visit in the hope of entangling Lewis in a literary venture. Their conversation convinced both men that they were kindred spirits. They were right: they remained writing partners until Howe's death 40 years later.

Coser and Howe cemented their friendship with the decision to launch a journal of ideas, for which Coser supplied the name *Dissent*. Their idea was to present socialist pieces to the literary public without falling into what they viewed as the three principal dangers: advancing a party line, publishing inferior work by friends, and publishing work that picked over Marxist minutiae (Howe, 1984). Coser was then still at work on his dissertation in addition to teaching classes at Brandeis. Despite this heavy workload, he and Howe quickly launched the journal in 1954 with enough funding to see it through a full year's run. They expected it would fold after a year, which they considered would still be a "noble effort" (Howe, 1984). The first issue generated some interest but was considered by both the editorial team and by many of the reviewers to be theoretically slight. Accordingly, for the second issue, Coser and Howe published 'Images of Socialism,' an extended meditation on unsuccessful socialist experiments characterized by failures of intellectual effort and the dangers of bureaucratic empowerment. Despite these failures, they affirmed socialism as Utopia, a 'no-place' that is nevertheless "the name of their desire," – a project ever in the making. The piece was partly adapted from an earlier article by Coser but it was the reworked version with Howe that would become a classic among American socialist writings. Howe would later note, "I imagine Lew would agree with my conviction that it is one of the best things either of us has done" (Howe, 1984).

The year that 'Images of Socialism' was published was something of an *annus mirabilis* for Coser. With Howe, he had both launched a successful journal and provided a socialist credo to guide it. He finally finished his dissertation and, at the age of 41, was awarded his PhD. At Brandeis, he had found an ideal environment to foster his political writing. Perhaps more importantly, both he and Rose were successfully employed as scholars and so had already achieved the modest dream they shared some ten years earlier.

Conflict Coser, 1954–68

At this stage Coser's immediate plans were to revise his dissertation into a book and start work with Howe on a history of *The American Communist Party*. In 1956, Coser published *The Functions of Social Conflict*, and in the next year published *The American Communist Party: A Critical History, 1919–1957*. The latter was both an intellectual history and scholarly analysis of sectarianism, in many ways an extension of 'Images of Socialism' that allowed Coser and Howe to sharpen their claims that dysfunction at the organizational level is a major obstacle to achieving the utopian vision shared by socialists and communists.

That same year, Coser also published a textbook *Sociological Theory* (1957) with Bernard Rosenberg. The textbook (much of which was excised from *The Functions of Social Conflict*) allowed Coser to make use of his research on the history of both European and American sociology. Meanwhile, *Dissent* was still going strong, although as Howe later noted, the journal quickly began "shedding more and more ideology; by about 1960 most of us no longer thought of ourselves as Marxist" (p. 66).

While the journal drifted away from Marx, the broader discontent at the heart of the journal was being echoed in dissent movements and acts of civil disobedience that seemed to be filled with the possibility of Utopia. The new tensions and conflicts rising to public awareness sorely tested the consensus-orientation of Parsons and his followers, including Merton. Instructors were faced with teaching material that seemed very out-of-date and they flocked to the three available books about conflict: Ralf Dahrendorf's (1959) *Class and Class Conflict in Industrial Society*, Max Gluckman's (1955) *Custom and Conflict in Africa*, and Coser's own *The Functions of Social Conflict*. The sudden and sustained popularity of the book boosted Coser's academic standing considerably. He was suddenly 'Conflict Coser,' which seemed apt enough, given the relative emphasis on conflict in his textbook and the considerable place of conflict in 'The American Communist Party,' as well as a stream of articles bearing on the subject. By 1964, his professional profile was such that he became President of the Eastern Sociological Society.

Coser next set to work on his most Weberian and Mertonian project to date, an ambitious work on the sociology of knowledge and culture, dedicated to understanding the place of intellectuals in political life, published as *Men of Ideas* in 1965. *Men of Ideas* resembles in several ways Jürgen Habermas's (1991[1962]) *The Structural Transformation of the Public Sphere*, which Coser had not read. (From personal correspondence with Walter W. Powell.) The main commonality rests in the fact that both authors are attentive to the relationship between spatial configurations and deliberative cultures as the proper starting point for understanding democratic political life. *Men of Ideas* reveals a probing engagement with the relationship between a mass public and those intellectuals who are both expert in understanding the public, yet unwilling to bend to serve it. This for Coser is the *sacrificium intellectus* an inevitable trade-off between gaining an audience and retaining intellectual honesty and independence.

Following *Men of Ideas*, which was well received, Coser expanded on his first book in the *Continuities in the Study of Social Conflict* (1967). This was primarily a compilation of Coser's articles and political writings on conflict, although it included some new pieces. The result was more tepidly received, with one reviewer expressing frustration that Coser did not attempt to expand the theoretical edifice of his first book. While his 'Conflict Coser' persona had already grown wearisome, the discipline continued to read *The Functions of Social Conflict*.

"Inside the Whale," 1969–75

The publication of *Continuities in the Study of Conflict* came at a time of growing unease for both Cosers. Powell and Robbins note that, "[b]y the late 1960s … a good deal of Brandeis's vitality had been sapped by internal conflicts, severe political polarization, and perhaps simply the sheer liabilities of aging" (Powell and Robbins, 1984). Coser himself typically viewed it through a Weberian lens, noting that Brandeis "became routinized like all charismatic institutions. By the time we left, 18 years later, I was glad to leave" (Rosenberg, 1984). Rose too had grown unhappy at Northeastern. Coser was approached by both Amherst College and the State University of New York at Stony Brook but neither considered Rose's future position. Their friend at Stony Brook, Hanan Selvin, understood that the Cosers were a team, and made sure that the next offer included both. The offer also included the chance to work with Selvin in reconstructing the department. They accepted and moved to Long Island in 1969 (Additional information for this section was drawn from the recollections of Coser's student Walter W. Powell.)

In his autobiographical writings, Coser would often point to feelings of marginality, of being "a stranger within the gate" (Coser, 1988). By contrast, he would describe his arrival with Rose at Stony Brook, he as a distinguished professor, she as a full professor, as final confirmation that they were "inside the whale" (Coser, 1988). The Cosers invested themselves deeply in aiding Selvin in building the department, to the point where their home became a regular setting for faculty events, PhD seminars, and other functions.

The first year at Stony Brook was spent on what Merton described as a classic. Coser's *Masters of Sociological Thought* (1970), is a productive synthesis of his popular textbook, *Sociological Theory*, his conflict research, and his work in the sociology of knowledge. *Masters of Sociological Thought* unfolds detailed biographical and sociological portraits of 12 classical figures (including the European fathers of sociology, Comte, Marx, Spencer, Durkheim, Simmel, and Weber, as well as the early American reformer sociologists Veblen, Cooley, Mead, and Park). As with his textbook, this is written with a light hand and aimed in part at students and nonspecialist readers. But there is a depth to the work, drawing both from Coser's sense of productive conflicts and from his theoretical interests in intellectuals as key political actors. The outcome is a set of prismatic encounters with the great figures of the discipline, providing new insights into the connection between audience, political context, and classical sociological texts.

Coser experienced a second year of remarkable success in 1974. His administrative efforts with Selvin were paying off in a rapidly growing department. He also published *Greedy Institutions: Patterns of Undivided Commitment* (1974), which marked a turning point in Coser's decades-long engagement with the notion of sects. The book included several previously published pieces, including a study of the modern housewife written with Rose, but deeper connections emerge in his new material. The idea of a "greedy institution" that is oriented to taking more and more from the individual allowed Coser to reconsider his experiences among socialist sects, viewing them within the context of broader societal patterns of conflict. As the sect attempts to take more and more resources from its members in its conflict with the rest of society, it repeats the familiar pattern of strengthening internal ties by breaking down existing relationships to the broader society and triggering nonrealist conflict dynamics. The result may be personally frustrating (as in Coser's experience with socialist sects) or profoundly devastating (as with the cultists at Jonestown). A corollary would be to once again reaffirm the importance of unattached intellectuals capable of speaking the truth to power and of realigning groups to real goals.

In addition to his productive work at Stony Brook and the publication of *Greedy Institutions*, Coser realized a considerable professional achievement in 1973, when he was named the incoming President of the American Sociological Association. Typically, he saw that as an opportunity for productive conflict and political reform, in this case by means of a highly provocative presidential address titled 'Two Methods in Search of a Substance.' The 'methods' in question were ethnomethodology and the status-attainment research associated with the University of Wisconsin, which Coser viewed as communities of methodologists rather than as coherent theoretical traditions. Coser also sees here the logic of sectarianism. His address ends with the evocative warning that the discipline will "degenerate into congeries of rival sects and specialized researchers who will learn more and more about less and less" (Coser and Larsen, 1976). The address would give rise to a lively series of responses that would be published the following year as *The Uses of Controversy* (1976).

Around the same time Coser once more joined with Howe in a collaboration designed to stir controversy in the political arena. Their highly critical collection *The New Conservatives* (1973) advanced a very similar thesis to his critique of sociology. In both his presidential address and in this piece, Coser spoke to the new generation of writers (academic and intellectual), who he saw as hopelessly mired in internal and ultimately nonrealist conflicts. He warned them that their efforts served only to harden positions and deepen divisions. He told them that little true intellectual work was being done, little attention was being paid to social rather than sectarian concerns.

Sociologist and Socialist, 1976–2003

Coser was 62 when he was President of the ASA, a considerable accomplishment given that his career then only spanned two decades. Coser retired in 1987. The 12 years in between, saw him maintain his considerable productivity and professional standing. He undertook two more major projects, *Books: The Culture and Commerce of Publishing* (1982) and *Refugee Scholars in America* (1984). He also wrote a library of textbooks and edited volumes, political essays, and reviews. He had, however, established his core ideas and these projects were elaborations rather than revisions or redirections in his political and academic vision.

In *Books*, Coser (aided by his coauthors Charles Kadushin and Walter W. Powell) for the first and only time in his career, followed the traditional process of securing a major grant, collecting and analyzing data with the help of research assistants, and synthesizing the data in a series of articles and a manuscript. This reorientation to the empirical rather than

conceptual realm was both a professional success and another reflection of his enduring fascination with the very social character of knowledge.

The publishing project and the refugee scholars project further deepened his exploration of the intellectual as political actor, offering new insights into the institutional structures that intervene in the work of organic intellectuals. Of the two projects, the latter seemed particularly significant to both Cosers. The idea of 'coming to America,' treated for the first time at length in Lewis's last book, was a topic of pressing interest to Rose as well. Both approached the topic with rich biographical understanding but also, both treated it without the romantic or tragic grandeur often associated with the theme.

Coser prided himself on taking on the challenge of integration with good will and sincerity, never scorning what was American as many other intellectual refugees did. This second refuge was, after all, a permanent one. The Coser children were born and educated in the United States. In addition, Coser's father and sister eventually left Shanghai to join Lewis and Rose in America. In a revealing incident, the father and son were reunited after years of estrangement in tears and in laughter, as the father joked, "I lost all my money. Now you can be a socialist all you want. It doesn't make any difference to me" (Rosenberg, 1984).

Coser's Legacy

Lewis Coser's legacy must be connected to Rose's legacy. Both Cosers received the honor of Festschrifts and Rose was the first female sociologist so honored. Lewis Coser repeatedly stressed she was a major contributor to all of his works and said of her: "[s]he has had so intimate a part in my intellectual and emotional life that I find it almost impossible to sort out ideas of hers that later cropped up as mine. Ours continued to be an ideal collaboration of mind and a common sensibility that nothing could shake throughout the common joys and trials of half a century" (Coser, 1993). Rose Laub Coser died in 1994, a year after Irving Howe's death. Despite the loss of these great figures in his life, Coser remained intellectually active for some years to come, writing his last book review in 1999. He died in 2003 at the age of 89.

Coser, like his father, had the ability to face quite considerable obstacles with humor and optimism. This optimism is clearly discernible in the brand of democratic socialism that he continued to evolve. By the time he wrote 'Images of Socialism' with Howe, Coser no longer conceived his political project in terms of a social movement or grand ideology. Instead, his mature political writings reflect a contingent, contextual form of socialist agitation. It is here that his two careers can be seen to merge. Although strenuously adhering to Weber's ideal of 'value-neutrality,' this form of agitation is visible throughout his scholarly work. In his two books on conflict, Coser outlined how political dissent could foster richer democratic outcomes. In his many books in the sociology of knowledge and intellectuals, he stressed repeatedly the duty of the scholar to 'whole-of-society' concerns, the risks of sectarianism, and the great danger of reifying the bureaucratic structures of governance.

Coser pointed out with pride that his legacy was carried on by his many students, among whom he singled out George Becker, Bob Hoffman, Arthur Mitzman, Stephen Kalberg, and Walter W. Powell. His political legacy also endures in the form of the journal *Dissent*, now almost 60 years old; and here Coser would often point particularly to his successor at that journal, Michael Walzer, and others among this younger generation who sought to balance the roles of both scholar and intellectual. More diffusely, however, Coser's legacy is reflected in all forms of academic and independent critical sociology, those efforts dedicated to principled critique – whether in challenging conflicts that divide or equilibria that repress.

Cosmopolitanism

This article is a revision of the previous edition article by G.L. Ribeiro, volume 4, pp. 2842–2845, © 2001, Elsevier Ltd.

Abstract

Cosmopolitanism encompasses four distinct but overlapping perspectives: (1) an identification with the world or with humanity in general that transcends local commitments; (2) a position of openness and or tolerance toward the ideas and values of distinct others; (3) an expectation of historical movement toward global peace; and (4) a normative stance advocating cosmopolitan aims and actions. Cosmopolitanism has a collective aspect, theorized among others by Durkheim, and an individual-centered aspect, elaborated particularly by Kant. Wide-ranging debates exist concerning cosmopolitanism as a stance and as an object of study. The period since 1989 has, however, seen a strong resurgence of interest in cosmopolitan themes.

Cosmopolitanism encompasses at least four overlapping perspectives on individual and collective life. Each can follow from the other, but they may also stand alone, and in some formulations may conflict with one another. (1) The first and broadest view holds that there can be commitments to the world at large that transcend loyalty to nation, neighbors, and locally shared conventions. This view, at varying levels of intensity, can be discovered in otherwise quite distinct religious, political, and artistic settings. (2) In a second usage, cosmopolitanism describes an attitude of openness to, tolerance toward, and a desire to comprehend, the standpoints of others and their ways of being. This can range from lighthearted appreciation of the uniqueness and diversity of human lives to more formalized modes of hospitality toward others and their distinct worldviews. (3) Some cosmopolitan views rest on a vision or expectation of historical progress toward peaceful world community. Human conflicts, it is proposed, have been, and can be, surmounted over time through a progressive institutionalization of world citizenship and equitable global governance. (4) A further perspective is that cosmopolitanism provides normative principles for intellectual, political, or aesthetic emancipation. The most general of these is an ethic of world solidarity or *amor mundi*, love of the world. Historically, diverse models of responsibility and reciprocity have been adduced to support normative standpoints. What unifies normative cosmopolitanism is that it does not rest with what *is* or *might be* the case, but instead it prescribes what *should be* done. Noticeably, each of these four perspectives implies processes of subjective and or group change, because each one either encourages or takes for granted practices which will perforce alter the make up of the individual and collective pattern of life.

For social scientists, multiple puzzles present themselves in exploring the meaning and implications of cosmopolitanism. Of the four interrelated views above, each has many possible combinative shades of interpretation: for example, 'openness' may not imply the same attitudes as 'tolerance' even if the two often overlap. Likewise, research will have distinct foci. Where cosmopolitan phenomena are confirmed as valid objects of empirical inquiry, *methodological* questions arise. These include, e.g., how best to distinguish cosmopolitan motives or mechanisms ethnographically, historically or under experimental conditions, and how to gauge the specificity of cosmopolitan commitments. As cosmopolitan concerns cause social scientists to change or rework their models, *ontological* and *epistemological* debates are also foregrounded. These include, for example, whether particular social science disciplines are more cosmopolitan in orientation than others, or what are the consequences of labeling certain objects 'cosmopolitan.' *Normative* or ethical quandaries likewise emerge around whether the social sciences should work toward cosmopolitan goals and if so what this would imply ethically and otherwise.

The current burst of academic interest in cosmopolitanism is of quite recent origin, gathering pace from the 1990s onward, however, critiques of cosmopolitanism are as old as the ancient Greek concept of the 'citizen of the world' (kosmopolitês) itself. Perhaps the most familiar criticism of all is that the cosmopolitan is someone who is loyal to nowhere and feels no obligation to anyone in particular. In the twentieth century, the derisive notion of the 'rootless cosmopolitan' was conjured by the Soviet state with precisely this intention of labeling certain individuals as disloyal to the collective and singling them (Jewish intellectuals in particular) out for repression. In response to the presumption of disloyalty, some recent commentators have argued that cosmopolitanism can coexist with other scales of attachment including to kith and kin, region, city or nation, and need not be merely be an escape from these. Recent studies have also shown how cosmopolitan perspectives are available in diverse contexts and among many kinds of people. We return to these debates later in the article.

Cosmopolitanism and Collective Change

Though the word cosmopolitan still shows its origins in Greek philosophy and culture, cosmopolitan ideas have presented themselves in multiple civilizations and kinds of social organization. Late nineteenth-century sociologist Emile Durkheim theorized that cosmopolitan awareness arises from the aggregation of smaller and simpler social groups into larger more complex entities. In this view, cosmopolitanism is principally a religious sentiment that expresses and reinforces processes of social incorporation. There is a strong affinity between epochs of geo-political expansion and cosmopolitan discourse. The

extension of Chinese territorial control during the first millennia BC, for example, led to philosophical questions concerning the shared human values of *tianxia* or 'all under heaven' and to notions of an ideal cosmopolitan citizen. Another well-recognized case is the emergence of Christian cosmopolitanism during the Roman empire: the image of all Christians as alike in the face of God coincided closely with a model of shared citizenship in a large and diverse imperial ecumene. This image of humans as 'all one in Christ' would return when Bartolomé de las Casas' defended Amerindians from Spanish enslavement during the sixteenth century, and later also when black slaves in the Americas fought for their emancipation.

Cosmopolitanism as the transcendence of local values, in sense (1) above, is found in all the so-named world religions including Buddhism, Judaism, Christianity, and Islam. In turn, all of these worldviews grew through large-scale processes of geo-political interconnection and human mobility. In contrast, the commitment within world religions to cosmopolitanism as openness and/or tolerance to other modes of life, as in sense (2) has been significantly, and perhaps inevitably, more variable. This, in turn, raises a paradox for a cosmopolitan perspective: a universalist cosmopolitanism whether religious or secular (e.g., certain forms of secular liberalism) may insist on doctrines that eliminate the hospitality toward heterodoxy or difference which many would see as the greatest value of cosmopolitanism.

The most recent phase of engagement with cosmopolitan ideas can be understood at least partly in a Durkheimian or collective sense. The late 1980s and early 1990s were marked, among other events, by the beginnings of a new moment, and means, for exchanging knowledge globally. Through the linking of computers into a worldwide web, and the proliferation of mobile phone technology, millions of geographically dispersed people acquired, notionally at least, a new kind of social proximity. Economic and geo-political changes followed, each further shrinking what were in the past significant social and psychological distances. A period of cultural and social questioning began, debates arose about alternative kinds of polity and new modes of citizenship. In turn, unforeseen types of collective social action and institutional control have become visible, as have new ideologies or, in Durkheim's words, revised forms of 'collective consciousness.' The unpredictable pace of economic, political, and also ecological change at the beginning of the twenty-first century has meant that even wealthy polities are less certain of their capacities for governance at the national scale. This, in turn, has led to new quandaries concerning global human development.

Kant's Cosmopolitan Anthropology

From Comte in the nineteenth century onward, French social thought has argued that social relationships can be studied as having a facticity on par with physical facts. Individuals were much less an intrinsic object of inquiry in this school than social relations. Consistent with this approach, Durkheim, the greatest exemplar of the tradition, viewed cosmopolitanism as essentially a product of transformations in collective social structure. In contrast, German anthropology and sociology, after the work of Immanuel Kant in the 1790s, tended to focus on the individual in order to understand society, including cosmopolitan ideals. Kant initiated this tradition with a sequence of writings on anthropology and cosmopolitanism whose starting point was the potential for free-acting individuals to bring into being a cosmopolitan or world community. The cosmopolitanism of classical Greek and Roman philosophy had also centered on individual moral aims and in some cases likewise presented a historical narrative of widening cosmopolitan exchange between peoples; however, Kant introduced radical innovations into these earlier views.

Kant focused, in particular, on how individuals are architects of their own *Weltkenntnis*, the 'world knowledge' that a person develops and adopts as they come to know the world through time in their interactions with others. The cosmopolitan morality of the Stoic philosophers, despite the wider context of Mediterranean trade and conquest, and the growth of urban centers, was grounded in a set of largely fixed and stable virtues. In contrast, Kant's world, that of the late eighteenth century, was already global in shape and extent and witnessing rapid social transformation including the beginnings of industrialization. Kant drew on information supplied by recent voyages of discovery, mercantilism, and colonization to build his view. Controversy surrounds scattered racist and misogynistic opinions that Kant reproduces at various moments in his writing: it remains an open debate how far these statements undermine his cosmopolitan philosophy taken systematically. Certainly, cosmopolitanism should be thought of, in his words, as a 'regulative idea' rather than an established set of virtues. The ability to adopt a cosmopolitan view is indicative of the potential progress of humanity toward peaceful international coexistence. He argued that history is driven by contradictory tendencies. Humans seek their own advantage egoistically and often violently, but they are also socially dependent on others for their own welfare. A cosmopolitan anthropology must comprehend this 'unsocial sociability' of the human individual, through a pluralistic vision of the human condition.

For Kant, a cosmopolitan view describes an individual's attempt to understand, inclusively and hospitably, the diversity of human standpoints; giving full weight to the differences involved while still judging and acting responsibly. Unlike many contemporary Enlightenment philosophers, Kant accepted that human nature was substantially plastic and changeable. Humans can adapt to, and transform, their own environments and in doing so they change themselves: there are potentially many possible rules for interacting and hence varied ways of evaluating human hopes, intentions, and knowledge. Unlike his contemporary Herder, though, Kant did not accept that the best measure of a civilization was the values of that civilization itself. Human beings are capable of thinking beyond the constraint of local circumstances and worldviews by referencing what they have in common with others, their humanity. Cosmopolitanism is 'regulative' because it encourages the individual to open their thinking to the heterodoxy of human perspectives in the process of extending their comprehension of human co-responsibility. Bakhtin's concept of *heteroglossia* (the coexistence of multiple speakers without a single authoritative voice) and Foucault's appreciation of *heterochrony* ('diverse times') and *heterotopia* ('diverse places') also draw on Kant.

One aspect, then, of Kant's cosmopolitanism can be understood as purely formal, and in essence algorithmic. Any person is in a position to adopt an enlarged view of their own life, imagining it as one instance of a common humanity. There are potentially as many such views of how the world is and might be as there are human beings. However, in taking on this cosmopolitan stance as a responsibility, the individual acknowledges their own moral answerability vis-à-vis a heterodox worldwide community. An imaginative re-orientation of this kind can potentiate actual cosmopolitan obligations, rights, and freedoms, he argues. Kant was fully aware that humans welcome the standpoints and principles of others only to a limited extent. However, they also rely on each other. As the interactivity of people around the world grows, so does the urgency for humans to think in global or cosmopolitan terms, he argued. He considered that the world he lived in had already formed an interdependent community; albeit an incipient, often hostile and violent one.

Cosmopolitanism versus Nationalism 1918–89

In the nineteenth century, neo-Kantian social philosophy flourished. As the century ended, two prominent German social theorists, Simmel and Weber, developed aspects of Kant's work with the aim of creating a new discipline, sociology. Weber aimed at a systematic view of the social which, while taking the rational individual as an abstract point of orientation, shifted the analytical center of gravity toward the study of generalized ideological constructs or 'ideal types.' In the process, he moved away from the normative and cosmopolitan aspects of Kant's work toward a value-free comparative study of civilizational *Weltanschauungen*, that is, characteristic and grounding principles by which an individual or group interacts with their surroundings. Weber's stance reflects the growing organizational power of the state in shaping social values during his era. However, in contrast, the social philosophy of Simmel is much closer to Kant's anthropological style and his aim of exploring the emerging *Weltkenntnis* of the free-acting human being. Simmel was preeminently a theorist of urban life and he saw the city, modernity, and elements of a cosmopolitan outlook as broadly coterminous.

For Simmel, urban social life welcomes individual-centered forms of self-expression alongside notions of personal responsibility that transgress group loyalties. In other words, for him modern experience breaks down traditional virtues while encouraging the kind of cosmopolitan transvaluation that Kant emphasized. Simmel notes, however, that detachment from local concerns and attraction to things further afield often leads, not to widened moral commitment, but to an ethically blasé attitude. In a series of interconnected works, Simmel argues that the characteristic qualities of the city and modernity, an emphasis on what is transitory and fashionable, the salience of personal networks, as well as the ubiquitous use of money as a social solvent arise from a universal subjective search for freedom vis-à-vis objective conditions. In turn, these aspects reflect a fundamental human openness to new modes of experience alongside a desire for self-differentiation. The results, as Kant had indicated, include a cosmopolitan awareness of complex forms of social interdependency that extend well beyond immediate relationships.

What is striking, however, is how cosmopolitan debates receded from view in twentieth century sociology. A dominant stance in the social sciences between 1918 and 1989 was that societies or cultures were causal entities and the primary example of this was the relationship between the nation-state and the individual subject. This view responded to the very great significance of nationalism in shaping the history of the period and to the idea that the state was the primary vehicle for individual and social development. Durkheim's emphasis on the power of collective consciousness was pervasive: much less attention was paid to his ideas of social, including cosmopolitan, change. While systematic features of world history including center–periphery relations, migration, and what came to be called globalization were debated, cosmopolitan philosophies and identities were rarely discussed. Some of the most influential neo-Kantian social philosophers of this period, Habermas and Rawls, for example, began to address cosmopolitan concerns only in the closing years of the twentieth century. Even so, many supranational institutions came into being in the mid-century, including the United Nations and the International Court of Justice at the Hague. Likewise, politics took an international turn in the 1960s with the proliferation of Marxist-inspired internationalist liberation movements. Nonetheless it was taken for granted that national citizenship and national identity were the common destiny for most of humanity.

During the citizenship and national identity were the common century at least one social science, sociocultural anthropology, took openness to cultural difference to be a primary method. In this loose sense, anthropology has always been epistemologically cosmopolitan since its primary task is to comprehend the global diversity of social institutions, practices, and worldviews. As with other social science disciplines, though, there was a marked tendency in sociocultural anthropology in the period between 1918 and 1989 to describe culture as geographically localized, internally systematic, and relatively circumscribed. On the other side of the equation, during the same timeframe, certain anthropologists such as Firth also referenced a general human tendency to outstep cultural boundaries and categories. In perhaps the archetypal work of modern anthropology, Argonauts of the Western Pacific, Bronlislaw Malinowski shows the Trobriand Islanders as a classically functioning holistic society, but he also describes their cosmopolitan quests using outrigger canoes to exchange with other groups and individuals overseas.

Since at least the 1950s there have existed social scientific approaches which explore the sociocultural from subjective and open-ended points of view. Transactionalists and interactionists, for example, have understood culture, not as a closed entity, but as a situation of subjective and intersubjective assessment and action. Life histories have often highlighted the heterodoxy of individual experience when compared to the homogeneity of collective worldviews. However, theorization of these and other phenomena gathered pace during the mid to late 1980s as part of postmodern thought-trends. New words such as 'hybridity' and 'creolization' became widespread expressing a sense of the cultural overlap, mixture, and the plurality of contemporary experience. Multiculturalist and

postcolonialist debates also fed into these discussions. Indexings of cosmopolitan phenomena at this time, by social scientists such as Ulf Hannerz, show an invigorated alertness to global flows of people and things, in opposition to styles of analysis that emphasized closed and sedentary aspects of culture.

In retrospect, elements of a genealogy are recognizable from Kant via Simmel and the interactionist views, through postmodern trends, to the newer subject-centered cosmopolitan approaches that have recently reappeared. In the first decades of the twenty-first century, further interest has again been paid to Simmel due to his early and theoretically innovative attention to processes and constraints of network formation. This is significant since there is a close connection between current interest in cosmopolitanism and awareness of new kinds of social network, as mentioned above.

The Formalization of Recent Cosmopolitan Arguments

One of the theorists who has done most to formalize cosmopolitan themes in current social theory is Ulrich Beck. He describes what he sees as a crisis in 'methodological nationalism' which threatens latter-day social inquiry with incoherence. He argues, alongside others, that twentieth century sociology was characterized by a refiguring of social problematics in national terms. However, many of the stock objects of inquiry in twentieth century sociology including the family, the household, and social class have lost their previously taken-for-granted meanings under current conditions. These terms are still used to indicate or contest values that the nation-state is supposed to ensure, but the collective reality to which they refer has changed beyond recognition. For Beck, the symptom of these changes is that in each person's life there exists a conflict of cultures and rationalities which cannot be resolved by a simple resort to a national frame of reference. In effect, Beck proposes, social knowledge is undergoing a renewed phase of cosmopolitanization in which people become aware of interdependencies linking themselves to others beyond national and other boundaries.

Beck's arguments closely conform to, while elaborating, Kant's. He proposes that personal destinies are now globally interlinked to an unprecedented degree. Belonging to a particular state no longer brings with it the feelings of predictability and security that it might have promised in the past. Awareness of global levels of interconnectedness, beyond national citizenship, intensify the individual and collective sense of risk. At the same time this can also lead to a recognition of new kinds of shared responsibility extending beyond and sometimes against the demands of national community. From this perspective, there is a need to reimagine the social sciences through a shift from 'methodological nationalism' to 'methodological cosmopolitanism.' In turn, this move has epistemological and normative consequences. The claims made for a value-free sociology were underwritten by an implicit nationalist morality and metaphysics, Beck argues. Social science should instead now adopt an ethic of cosmopolitan answerability in its inquiries.

Beck's cosmopolitanism makes claims according to all four of the core meanings of cosmopolitanism mentioned at the beginning of this article. He argues (1) for cosmopolitanism as a viewpoint that transcends other kinds of attachments. (2) He emphasizes openness and tolerance to sociocultural difference, though only so far as this does not override a recognition of shared humanity. (3) He indicates general historical trends toward world community. (4) His position is also morally normative in as much as he encourages social science to take an affirmatively cosmopolitan stand. It should be noted that Beck's approach is more individualistic and Kantian than it is collective and Durkheimian. Likewise, Beck is notable for the consistency with which he applies a universalist Kantian cosmopolitanism to the current situation in the social sciences. Criticisms have been leveled at his view at all four of its levels of exposition. It is worth considering these criticisms, and those of latter-day cosmopolitanism generally, both for what they tell us about the assumptions of cosmopolitan theorists and also those of the critics themselves.

Debates around the New Cosmopolitanism

The 1980s and 1990s saw the Soviet Union disintegrate, the end of the apartheid system in South Africa, the break up of states created in 1918 such as Yugoslavia and Czechoslovakia, the formation of the European Union, an unprecedented availability of cheap air travel, and, perhaps most significantly of all, the global dispersal of radically new technologies for communication. We have seen that these transformations were taken as a cue for revised types of cultural inquiry focused on travel, shifting personal identities, and intensified cultural interconnectedness. An initial counterargument to these intellectual foci involved pointing to the fact that, despite high levels of human mobility, most of the world's population remains relatively sedentary: likewise the majority still do not have even approximately equal access to the vaunted new technologies. Likewise processes of globalization do not necessarily lead to a shared vision of, or inclination toward, world community or even to a sense of social interconnection: in many cases, the tendency is contrarily toward fundamentalist localism.

A further critical view holds that recent discussions of cosmopolitanism are in effect benign descriptions of capitalist exploitation. In this counterperspective, the most salient feature of the 1980s, 1990s, and 2000s has been how neoliberal policies were deployed to disassemble social safeguards originally put in place by nation-states after the Second World War. Where supranational institutions such as the World Bank and the IMF intervened in this period it was not to create new rights of citizenship for all, but rather to urge the privatization of state-controlled institutions, especially programs of social welfare, and to insist on unrestricted corporate access to local communities and their markets. Certain individuals and groups benefited from these processes acquiring, in effect, cosmopolitan privileges within the new international political and economic disposition. In sum, the accusation is that world citizenship, and the vista on world affairs it offers, remains the preserve of a wealthy elite and serves its interests: to project cosmopolitanism beyond that grouping is to hide the real damage to local social relationships resulting from the destructive interventions of corporate capitalists.

It has been estimated that for the first time in history, from 2008, more people worldwide live in urban rather than rural settings. We have seen that, in at least some views, what is significant about cities is how they expose city-dwellers to problems of cultural difference and social distance; it has been argued that urbanity corresponds closely to the individualization and cosmopolitanization of experience. From this perspective, a general cosmopolitan trajectory in history seems irreversible. Simmel noted how, in isolated kin-based communities, strangers represent an intrusion of difference into a relatively homogeneous way of life; they inspire combined investments of fear and attraction. In a more intensified way, within the modern city, all urbanites become strangers at varying levels and degrees: all must learn to assess and incorporate differences, balancing this with their desire for social and personal completeness. If only because of the pressure of population density, urbanites must agree to cooperate with culturally distant others; people who their forebears might not even have considered to be fully human. The results of these processes have been new types of commensality and, arguably, historically new cosmopolitan ideals and forms of personhood.

While they might agree that urbanization may lead to some of the cosmopolitan situations and outcomes described by Simmel and others, critics argue against the inevitability, let alone the desirability, of the tendencies involved. A counter-perspective points to the fact that urbanization creates new types of ghetto and gated community, in other words a plethora of no-go-areas and new ways of excluding strangers. Indeed, people may purposefully choose to live in closed social niches as a means of ontological self-preservation. Cities, like human environments in general, are subject to constant change and encompass radically distinct lifeways, status hierarchies, and economic disparities. New communicative technologies, rather than catalyzing cosmopolitan interchange and the appreciation of heterodoxy, can isolate people further within imagined social boundaries. Whether a specific setting evidences growing cosmopolitanization, increasing ghettoization, both or neither, is to a great degree a matter of how questions are formulated and the point at which the phenomena at issue are transected empirically. Here we enter complex territories of translation, interpretation, and evaluation and further thoughtful investigation is needed using new ethnographic, archival, and experimental methods.

The attempt to explore and comprehend the highly diverse worldviews that currently exist is, arguably, an intrinsically cosmopolitan task. At the same time, a paradox is initiated: the more extended the search, the greater the likelihood of encountering practices and ontologies so divergent that expectations concerning further mutual comprehension must be indefinitely deferred. An example is the contrast between the humanist ideals prized in the West versus the animism still valued in many communities worldwide. Within a humanist view, human individuality has moral priority over relationships to other entities. Contrastingly, in an animist perspective, animals, humans, and the material world are understood as spiritually coimplicated; humanness does not have a distinct priority. One kind of answer from Kantian philosophy is that, if nothing else, individual human awareness forms a point of common reference out of which shareable models of responsibility and translatability can grow. However, some critics argue that this attempt to ground cosmopolitan expectations in universal features of human selfhood reproduces a fundamental misunderstanding.

The French tradition of sociology rooted in the work of Comte, Durkheim, and Tarde has provided a number of arguments against Kant's proposal that cosmopolitanism is grounded in universal capacities of human individuality or subjectivity. Recently, following this tradition, Latour has reasserted that there is no meaningful human individuality outside the historically specific networks of agents and things through which subjectivity takes shape. He also argues, though, that there is no bounded society in the holistic causative sense that Durkheim proposed. Cosmopolitanism depends on being able to take a universal or synoptic view on human affairs. However, Latour proposes, this synoptic vision is achievable neither individually nor collectively: it is an illusion. There are, nonetheless, conflicts between different cosmologies, animist versus humanist, for example; these emerge in distinct situations of network formation. So, even though there can be no meaningful cosmopolitanism in either Kant's or Durkheim's sense, there is necessarily cosmopolitics, that is, conflict and negotiation concerning how the cosmos is made up.

Most of the criticisms and debates indicated up to this point turn on the relationship between how the cosmopolitan is imagined and the kinds of empirical phenomena which support these imaginings. Bruno Latour has argued that 'cosmopolitics' is a kind of war between distinct interest groups about how the cosmos is constituted. Latour's thus shifts the question to metaphysical claims and counterclaims. Certainly, one response to Latour's argument might be that when he adverts to the many warring cosmologies in existence he is claiming some type of synoptic, overarching, or cosmopolitan awareness of this manifold. Likewise, if we take from Latour description of cosmopolitics a responsibility to acknowledge the diversity of worldviews, then, again, this is consonant with the principle of cosmopolitan openness and tolerance. His view also fits with cosmopolitanism understood as a theory of, or quest for, change toward peaceful coexistence. This brief delineation of topical arguments and counterarguments by no means exhausts the questions raised, though.

Conclusion: The Applications of Cosmopolitanism

The core ideas and looser trains of thought that give rise to cosmopolitan debate sometimes conflict with each other and sometimes produce paradoxical results. As Derrida among others has pointed out, the urge to be hospitable, a core facet of cosmopolitanism, involves a wish, however generous, to demonstrate one's power over another. In absolute terms, hospitality to others and toward their viewpoints is necessarily double edged and paradoxical. When openness to the other reaches a certain pitch the roles are reversed: the host is now the other's guest and, in that sense, in their thrall. Hence, engagement with cosmopolitanism foregrounds a concern regarding who is host and who guest in today's multipolar, and in certain respects postnational, world. Cosmopolitan fulfillment, as this is subjectively imagined, likewise seems inevitably to run

against the actual global disposition of political and economic power.

Cosmopolitanism can present itself as a moral predicament and it can become an object of inquiry, or it can be both. As a focus of social scientific investigation the tasks involved are extremely varied. Those who currently study cosmopolitanism themselves belong to an increasingly interconnected global public sphere; a network, and in principle a community, of people largely proclaiming secular liberal goals derived from the thinkers of the enlightenment and its aftermath. These features may present both an advantage and a disadvantage. In principle, the demand of a cosmopolitan view is that it should show the fullest awareness of human differences possible, while demonstrating the widest comprehension of human commonality. Theoretically it should be possible to start from any standpoint or global subject position and explore that stance in cosmopolitan terms. The question now, as in the past, is whether there can be a cosmopolitanism that is both intellectually coherent and genuinely open, accommodating, and tolerant toward others.

As a field of inquiry, cosmopolitan studies increasingly recognize that cosmopolitanism is as much a description of change as a universal set of principles. Kant centered his anthropological cosmopolitanism on questions that the self asks itself: 'What can I know?' 'What should I do?' 'What can I hope for?'; uncertainties that alter the individual's relationship to others and to the world at large through time. One way of thinking about cosmopolitanism as a process is to consider how the *Weltkenntnis*, or world knowledge, of the individual or the group can outgrow the worldview, or *weltanshauung*, that nourishes it. While human lives find a center in practical habits, shared values, and reciprocities, a periphery or horizon also continuously unfolds where new ideas and extended networks of relationship come into view affecting the future of self and community as these have been imagined up to now. Inclusion of what was once at the periphery of experience and knowledge provokes a recentering of activity and a widening of scope on the world. This process need not be sparked by any heroic ethical motivation, it may instead come about as a result of curiosity and desire, dissatisfaction and listlessness, or an intensified sense of fear, risk, and uncertainty. At least in one basic formulation, then, cosmopolitanism describes a dynamic of change in the organization of groups and the lives of individuals. However, since methods and concepts for understanding cosmopolitan motivations, perceptions, and institutions are still only sketchily developed, there remains much to be done.

This article is a revision of the previous edition article by R.H. Haveman, D.L. Weimer, volume 4, pp. 2845–2851, © 2001, Elsevier Ltd.

Abstract

The purpose of cost–benefit analysis (CBA) is to make better-informed, more consistent public policy decisions. CBA is a method for assessing the economic efficiency of proposed policies or programs through the systematic prediction and valuation (i.e., monetization) of all costs and benefits to all members of society. The concepts of 'willingness to pay' and 'opportunity cost' guide the valuation of social benefits and social costs. Future benefits and costs are discounted at the social discount rate.

The purpose of cost–benefit analysis (CBA) is to make better-informed, more consistent policy decisions (*see* Policy Analysis: Evidence-Based Policy Making). CBA is a method for assessing the economic efficiency of proposed public policies through the systematic prediction and valuation (i.e., monetization) of social costs and social benefits. While individual decisions focus on benefits and costs to the individual, CBA considers the benefits accruing to and the costs incurred by all members of society – hence the terms social benefits and social costs. (For expositional convenience, however, from here on we will simply use the terms benefits and costs, although we mean social benefits and social costs.)

The concept of 'willingness to pay' guides the valuation of policy benefits and the concept of 'opportunity cost' guides the valuation of policy costs. CBA values all policy effects on all members of society and aggregates them to yield the net benefits of the policy. A policy with positive net benefits is economically efficient relative to the status quo. When there are many policy alternatives, the decision rule is: choose the policy, or set of policies, that maximizes the net benefits.

The roots of CBA can be traced back to Sir William Petty who urged the evacuation of the residents of London to reduce deaths due to the great plague, 1665–66. CBA gained prominence in the 1930s as a technique for systematically measuring benefits and costs of flood control projects sponsored by the US federal government (for an overview, see Steiner, 1974). In the 1960s, it was used extensively in the UK's Department of Transportation (Colvin, 1985). As the scope of governments grew, and economists gained influence as policy analysts, the use of CBA expanded well beyond the evaluation of public works and other infrastructure projects (*see* Infrastructure Investment). It has also been used to evaluate changes in regulatory policies, environmental policies, health care, welfare-to-work, education, income transfer, privatization, and in many other policy areas (*see* Regulation, Empirical Analysis of; Welfare Economics). In the US, Executive Order 12866 (4 October 1993) requires federal regulatory agencies to assess both the costs and the benefits of proposed regulations.

CBA can be forward looking (ex ante) or backward looking (ex post); that is, it can be used to evaluate whether a proposed project will increase efficiency or to evaluate whether an implemented project did increase efficiency. Ex ante CBA is appropriate for policy decision-making purposes. Ex post CBAs can help guide and improve the quality of ex ante CBAs as well as provide information about the allocative efficiency of actual government policies.

Foundations of CBA

As with the neoclassical economic theory that guides market analysis, CBA rests on the analytical underpinnings of modern welfare economics. Modern welfare economics takes a utilitarian perspective and presumes that aggregating the well-being (utilities) of the individuals who make up society is a valid measure of social well-being. CBA provides a basis for inferring changes in utilities, which are unobservable, from economic choices and outcomes, which are generally observable. It expresses the value of changes in utilities in terms of dollars or some other monetary metric. Thus, CBA can be thought of as the accounting protocol of welfare economics for measuring the changes in utilities caused by changes in public policy.

The principle of Pareto efficiency lies at the heart of welfare economics (*see* Pareto, Vilfredo (1848–1923)). An allocation of goods is Pareto efficient if there exists no alternative allocation that makes at least someone better off without making anyone else worse off. The intuitive appeal of Pareto efficiency is obvious: one would have to be malevolent to oppose a reallocation that betters the situation of someone without harming anyone else.

Although the Pareto efficiency criterion seems unobjectionable as a basis for judging the desirability of public policies, it would be largely useless as the basis for government choice because every policy inevitably has a negative impact on someone. This limitation of Pareto efficiency prompted efforts to develop a criterion with more general applicability to actual policy decisions. More specifically, it led to the 'potential Pareto improvement' criterion, which is also called the 'Kaldor–Hicks criterion' after Nicholas Kaldor and John Hicks. A potential Pareto improvement exists if a change in the allocation of resources allows those who gain to fully compensate those who lose and still be better off. This criterion expands the set of situations and policies about which statements may be made as to whether economic efficiency has been increased, decreased, or left unchanged. If a potential Pareto improvement takes

place, then there is a gain in economic efficiency, also called 'allocative efficiency.'

In order for a potential Pareto improvement to occur, those who gain must gain more than those who lose. Put simply, the benefits must exceed the costs or, equivalently, the net benefits must be positive. CBA attempts to maximize allocative efficiency by choosing the project with the largest net benefits.

Note that it is not necessary for those who gain to actually compensate those who lose. If those who lose were compensated so that they were no worse off than before and the gainers were still better off, then the reallocation would be an actual Pareto improvement. In addition, note that any Pareto improving reallocation would also be a potentially Pareto improving reallocation.

The amount that someone is willing to pay to obtain a policy's impacts depends on his or her wealth. The potential Pareto improvement criterion takes the current distribution of wealth as given. Although improved environmental quality may convey the same physical effect on all people, more wealthy individuals would probably be willing to pay more for this benefit than those who were poorer. The aggregate willingness of a society to pay for a policy impact depends on the level and distribution of wealth among its members. Thus, the benefits used in CBA are contingent upon the particular distribution of wealth that exists in the society. Furthermore, using the potential Pareto criterion as a decision-making rule implies that the current distribution of wealth is legitimate.

Implicitly, CBA assumes that the marginal utility of income or wealth is equal across all members of society. That is, a poor person derives the same utility (benefit) from an additional dollar as does a poor person. A project that transfers a fixed amount of money from one person to another or from one group of people to another group is, from the perspective of CBA, simply a transfer and has a net benefit of zero (ignoring transaction costs).

In summary, CBA concerns allocative efficiency, not equity. According to CBA, a project should be adopted if it increases allocative efficiency, whether equity increases or decreases. Put succinctly, CBA focuses on maximizing the size of the 'economic pie,' not on how the pie is distributed. Later, we discuss distributional CBA and 'passive use' benefits that incorporate some aspects of equity into CBA.

Alternative Projects and the Counterfactual

In ex post CBA, an implemented project is compared to a counterfactual, which reflects what would have happened if the implemented project had not been implemented. If there would have been no change in policy, then the most appropriate counterfactual would be the status quo. Sometimes the status quo would not have been viable and the implemented project would have displaced some other specific alternative. In this case the most appropriate counterfactual would be the displaced specific alternative. In either situation, however, the analyst compares the net benefits with the project to the net benefits without the project. Alternatively, the analyst can calculate the incremental benefits of the project relative to the counterfactual and can calculate the incremental costs of the project relative to the counterfactual. CBA would conclude that the implemented project increased allocative efficiency if the incremental net benefits were positive.

When conducting ex ante CBA there are often many alternative ways of achieving the same broad objective. One of the first tasks in CBA is to describe the various policy alternatives. If there is only one proposed alternative project, the analyst must determine if the net social benefit would be greater with the proposed project than without the project or if the incremental net benefits of the project would be positive.

The Issue of Standing

Costs and benefits in CBA derive from the preferences of the individuals who make up society. But what defines society? And are all preferences legitimate? Borrowing on legal terminology, these questions have come to be known as issues of 'standing' (Whittington and MacRae, 1986).

Recognizing that the citizens of a country share a common constitution, which sets out values and rules for making collective choices, and they participate in the same national economy, most analysts define society at the national level. Thus, the CBA analyst would usually consider all of the benefits received and all of the costs incurred by all of the residents in the country or all of the citizens of the country. However, subnational level governments, such as States in the US or Provinces in Canada, often fund projects that primarily affect residents in their region but might also affect people living in other regions. A subnational government might require the analysis to be conducted at its subnational level. If so, the benefits received and costs incurred by residents of other regions would not be included in the analysis because they would not have standing. An analysis from a regional government perspective might reasonable consider a grant received from the national government as a benefit. However, if the analysis were conducted at the national level, the grant would be treated as a transfer because it involves an offsetting national cost.

Analyses of some environmental policies, such as the reduction of greenhouse gases, and of some health policies, such as the reduction or eradication of polio, are best conducted at the global level because they are global issues. In this case, the analyst should consider all of the benefits and all of the costs on everyone.

The above discussion implies that only people have standing. Plants, fish, and animals do not. Consequently, the cost of a policy that leads to the extinction of a species might reflect how much people are willing to pay to avoid such a loss, but any suffering experienced by members of the species itself would not be included.

Most would agree that an accounting that accepted the preferences of all people as legitimate would be too broad. For example, most observers would not view the pleasure that psychopaths get from physically abusing people as an appropriate part of the utilitarian calculus. However, drawing the line between legitimate and illegitimate preferences is sometimes difficult. One approach is to rely on the existing legal framework for guidance (Zerbe, 1998), yet doing so assumes that existing laws are moral.

Identification and Categorization of Impacts

Analysts need to identify all of the impacts of a project that accrue to those with standing. Most impacts change the observable behaviors of individuals and are called 'active use' impacts. For example, preserving a wilderness area would facilitate bird watching, an observable behavior. Some government policies also produce impacts that benefit people without changing their observable behaviors. Such behavior is described as 'passive use.'

Active Use Impacts

Consider a government project that will provide irrigation to avocado producers. The major inputs would be the resources for the project – design, excavation, construction, land, and transaction costs. The major outputs would be more avocados produced and a lower price of avocados. There might also be some environmental costs or benefits. Analysts should identify each observable impact and classify it as a cost or benefit. Naturally most inputs are costs. Some outputs are a benefit to some people, but a cost to others. For example, draining wetlands to provide housing might be a benefit to people who want housing but a cost to environmentalists who previously enjoyed the presence of ducks or other wildlife.

Comprehensively taking account of the impacts of a policy means that CBA differs from financial analysis. Considering only the financial revenues and costs to government agencies is generally inadequate for CBA because it does not take account of all impacts on citizens. The decision about where to locate some new service-providing branch of a government agency is often based on financial costs. However, some locations are much more accessible by users than others. A CBA would also consider users' transportation costs and their time spent getting to the facility. More accessible locations would have more users and would therefore provide greater benefits to users.

Analysts should be careful not to 'double count' benefits or costs. A new subway station benefits commuters who live nearby because it reduces their travel time. In addition, it will lead to higher property values near the station. Treating both the reduction in travel time and the increase in property values as benefits would be double counting because property values have increased due to the reduced travel time. One impact is a consequence of the other; it is a 'knock on' effect. Another reason why property price increases should not be included is that it is a distributional impact and does not have an aggregate net benefit. Prices increase near the subway station because people want to move there. But these people are moving from somewhere else and prices in those areas will decrease or will not increase as fast as they would have done without the new subway station. In aggregate, there is no net change in the value of property.

The 'knock on' increase in property prices can be thought of as a 'secondary market' effect of a policy (Haveman and Weisbrod, 1975). The benefits of a project can generally be computed from its direct effects in the 'primary market.' For example, the primary benefit of stocking a lake with game fish is to increase the supply of fishing days. But, the improved fishing might lead to the construction of a nearby hotel or the employment of more workers and so on. It is tempting for some to suppose that these knock on effects create additional benefits. However, when the secondary markets are competitive, these effects should be ignored. The reason is the same as the one given above: it is incorrect to attribute any benefits to the secondary effects because they involve offsetting costs. It is especially tempting for politicians to suppose that knock on effects create additional benefits. Indeed politicians are tempted to use multipliers, that is, to multiply the primary market benefits by some usually arbitrary number. While multipliers are often used in economic impact analysis, they should never be used in CBA.

Secondary market effects should be included in CBA where those markets are not perfectly competitive or where the government policy affects the market price. For example, buying many tons of concrete for a dam in a local market may drive up the price of concrete, as the marginal costs of producing concrete increase. However, most of the additional payments, called 'rents,' are transfers from the project budget (government) to existing suppliers and therefore do not affect the net benefits. Furthermore, the effect may be transitory: if the market is competitive, new entrants will lower the market price.

Passive Use Impacts

Analysts have found it useful to identify three distinct categories of passive use. First, a policy may have 'option value' (Weisbrod, 1964). People may value a good because they anticipate the possibility of using it in the future. Only when they actually use it, if ever, will their behavior be observable. For example, a person may be willing to pay something now to preserve a national park in Alaska with the hope of visiting it someday. The person's circumstances, however, may never allow the visit to be made.

Second, a policy may have 'existence value' (Krutilla, 1967). People may value a good even if they anticipate they will never use it. For example, a person may derive benefit from the preservation of a wildlife habitat that would be completely closed to the public. One motivation may be a belief in the intrinsic value of the natural order. Another motivation may be altruism: a desire to make the good available either to the current generation, or to bequeath it to future generations.

Third, a policy may have a 'donor value' (Hochman and Rodgers, 1969). People may derive benefits from a policy that distributes goods in a way they view as desirable. The motivation may be altruistic, say, in providing more to those who otherwise would be consuming less. It may be motivated by values of equality or fairness. The inclusion of donor values integrates individual preferences over the distribution of wealth into the efficiency framework, broadening it from a normative perspective.

Option value is best thought of as an adjustment to net benefits or expected net benefits, as discussed later, although it is often useful to show it as a separate category. In contrast, existence value and donor value can be thought of as additional categories of benefits.

Prediction and Valuation of Policies in Well-Functioning Markets

To begin, consider a 'well-functioning' market where the demand and supply curves are known or could be estimated. The market may be perfectly competitive or there may be some government intervention in an otherwise perfectly competitive market. Also suppose that the proposed policy interventions will affect the market outcome in a predictable way. For example, it might pertain to the introduction of subsidies in a competitive market or policies that regulate a monopoly in different ways. In these situations, the incremental net benefits of the policy can be calculated relatively easily using the tools of welfare economics.

Measuring Benefits

The fundamental concept for guiding the measurement of benefits is the willingness to pay of those affected. The analyst wishes to know the maximum amounts individuals would be willing to pay for policy impacts that they view as beneficial, and the minimum amounts individuals would be willing to accept as compensation for policy impacts that they view as harmful. In other words, the analyst would like to know how much each individual's wealth would have to be adjusted in conjunction with the policy change so that the individual's utility remained unchanged. The algebraic sum of these wealth adjustments for all individuals measures the social value of the benefits of the policy in terms of dollars. Although some theoretical caveats apply (Blackorby and Donaldson, 1985), policies with larger positive sums have larger benefits.

A person's 'Hicksian' or 'compensated variation demand curve' for a good tells how much of a good the person wishes to purchase as a function of the price of the good, holding all other prices and the person's utility constant. In practice, however, analysts usually work with the Marshallian demand curve that holds income (or wealth) constant, not utility. Fortunately, these demand curves are often sufficiently similar so that analysis of the 'Marshallian demand curve' provides a good approximation of individual willingness-to-pay amounts (Willig, 1976).

An individual's 'inverse demand curve' reflects, at each level of consumption, the person's willingness to pay for an additional unit of consumption – their marginal benefit. Adding up the marginal benefit for each of the units consumed gives the total benefit to the person from participation in the market or experiencing services produced by the public sector. (Graphically, the individuals' total benefit is the area under the individual's demand curve from zero units to the number of units actually consumed by the individual.) The (total) benefit to all members of society can be calculated by summing the individual benefits. In effect, it can be calculated as the area under the market demand curve from zero units to the number of units consumed by everyone in society, where the market demand curve is the horizontal sum of the individual demand curves.

If a policy either satisfies a demand that has not been met, or changes the price of a good or service that people are already consuming, the benefits to society will be changed. The change in society's aggregate willingness to pay for the impact of the policy measure provides a measure of the incremental benefits of the policy.

Empirical evidence shows that people's willingness to pay for a gain is generally much less than their willingness to accept in compensation for a loss, even if the gains or losses are small (*see* Behavioral Economics). Furthermore, people may view positive changes as reductions in losses rather than as gains. For example, they may view policies that control air pollution as an attempt to not make pollution worse rather than as improving pollution. In such circumstances, willingness-to-pay estimates of a policy to control pollution are likely to be smaller than what people would be willing to accept to forgo the pollution control policy. The correct measure depends on people's reference point: whether it is the pollution level before or after the policy were implemented (Knetsch et al., 2012).

Measuring Costs

The implementation of policies usually requires the use of inputs that could be used to produce other goods or services. CBA uses the concept of opportunity cost to value these impacts. The opportunity cost of an input is the value of the goods and services that the input would have produced in its best alternative use.

In a perfectly competitive market, the market supply curve measures the marginal cost of the resources used in the production of the good or service. The area under the market supply curve from zero to the number of units produced equals the total variable cost of producing those units. The cost of a policy, assuming there is no 'externality,' equals the change in total variable costs plus any incremental fixed costs.

Most government projects are funded out of taxes. Even if a project is financed in the short run by an increase in the deficit, it will ultimately be paid for by higher taxes. Standard practice in CBA is to treat a dollar of accounting cost raised through taxation as having a cost of a dollar. In effect, this approach treats taxation as a transfer: taxpayers lose, the government gains and there is no impact on net benefits. However, raising taxes has a cost: it reduces allocative efficiency (i.e., it creates a 'deadweight loss') because it affects people's consumption, labor supply, and investment decisions. The amount by which the cost of a dollar of tax revenue exceeds its nominal value is called its 'marginal excess burden.' Expenditures funded by tax increases, and revenues allowing tax reductions, should be adjusted by the marginal excess burden of the relevant tax. Estimates of marginal excess burdens have been made for many different taxes in many different countries (Dahlby, 2008).

Computing the Net Benefits and Social Surplus

Given the incremental benefits of a policy or project and its incremental costs, the incremental net benefits can be obtained by subtraction. Alternatively, the incremental net benefits can be calculated using the concept of 'social surplus.' Most government policies affect consumers, producers, and government. The impact of a new policy on consumers can be measured by the change in 'consumer surplus,' the impact on producers can be measured by the change in 'producer surplus,' and the impact

on government can be measured by the change in 'government surplus.' Social surplus equals the sum of consumer surplus, producer surplus, and government surplus, where the latter should be adjusted by the marginal excess burden of taxation. The advantage of this approach is that it provides information about the distributional implications of a policy.

An individual's consumer surplus for a unit consumed is the difference between what the individual is willingness to pay for that unit and the amount he or she actually pays. Adding up the consumer surpluses for each of the units consumed gives the individual's (total) consumer surplus that results from participation in the market or experiencing services produced by the public sector. Graphically, the individual's consumer surplus is the area under the individual's demand curve but above the market price from zero units to the number of units actually purchased. Aggregate consumer surplus equals the sum of the individual consumer surpluses or, equivalently, it equals the area under the market demand curve but above the market price.

Analogously, the producer surplus equals the area above the market supply curve but below the price. If producers do not incur any incremental fixed costs as a result of a new policy, then the change in producer surplus equals the change in producers' profits. Government surplus equals net government revenue, which is usually negative because most projects are paid for by government.

Prediction and Valuation of Policy Impacts in Poorly Functioning Markets

The preceding section pertains to situations where the relevant market demand and supply curves are known. In practice, this condition is rarely met. Health and transportation policies, for example, affect morbidity and mortality (*see* Transportation, Supply, and Congestion). However, there is no well-functioning market for either of these 'goods' and consequently it is not easy to estimate the required supply or demand curves. The same problem pertains to 'environmental goods,' such as improvements in air quality. In such situations, analysts usually proceed in two steps: first, they predict the benefit and cost impacts and then they value (i.e., monetize) each impact (Boardman et al., 2011).

Prediction of Impacts

The analyst must either predict the impacts with the project and without the project (the counterfactual) or he or she must predict the incremental impacts of the project. For example, in order to estimate the costs and benefits of a new irrigation project, an analyst could predict the yield of crops and the environmental quality that would arise with the project and, for comparison, the yield of crops and the environmental quality that would arise without it. Alternatively, she may predict the change in the yield of crops and the change in environmental quality. Often, the latter approach is easier.

Whichever approach is adopted, analysts use a variety of methods to make predictions. The past is often the best guide. If an intervention saved so many lives when it was introduced in one country, analysts can use that information to predict how many lives it will save in another country. Of course, the prediction must take account of different circumstances, tastes, cultures, and behaviors. Relying on only a single previous study is risky because it may have been poorly conducted and it provides only one data point. More studies would enhance one's confidence. Predicting the impacts of new, unique projects with no previous direct evidence is especially difficult.

Valuation of Benefits Using Revealed Preference Methods

People may convey information about their willingness to pay for changes in some impacts by their action in other markets. Earlier we argued that changes in property values may reflect changes in commuting times. In other situations, changes in property values may reflect changes in the level of noise pollution or in the level of air pollution. Economists can use this information to derive a 'shadow price' for different types of pollution, that is, what the marginal cost would be in a well-functioning market.

People employed in jobs with high 'fatality risk' (i.e., a high chance of suffering a fatality) are generally paid more than people in jobs with low fatality risk. By examining the trade-off between higher salaries and higher fatality risk, economists can infer how much people are willing to pay for increased safety (i.e., for a reduction in fatality risk) (*see* Safety, Economics of; Value of Life, Economics of). In practice, salaries depend on many factors in addition to fatality risk. Analysts control for these and other factors, including selection bias, using the 'hedonic regression method.' The hedonic wage method is one of a number of revealed preference methods used to estimate the 'value of a statistical life' (Viscusi and Aldy, 2003).

Many impacts may require valuation in a CBA. The analyst is unlikely to have the time or other resources to conduct their own study to independently value each impact. Instead, analysts will seek out 'meta-analyses' of previous research or will use a 'plug in' value based on prior research or from some reputable source, a strategy called 'benefits transfer.' For example, the US Environmental Protection Agency (2013) recently estimated the cost of carbon (i.e., the benefit of reducing carbon dioxide emissions by 1 metric ton) at $46 in 2020, stated in 2011 dollars, and using a discount rate of 3%. This value can be used in numerous CBAs pertaining to health or the environment.

When existing shadow prices are used in a new context they must be adjusted to reflect the differences between that context and the context where the value was estimated. The value of a statistical life has a positive 'income elasticity': people are willing to pay more to save their life as their incomes rise. Consequently, people in rich countries are willing to pay more for safety improvements and for improvements in carbon dioxide reduction. Most estimates of the value of a statistical life are derived from the US, which has one of the richest populations in the world. These estimates should be modified for use in countries with lower income levels (Hammitt and Robinson, 2011). They should also be modified if relevant tastes and cultural values are different.

Valuation of Benefits Using Continent Valuation Methods

It would be ideal if analysts could elicit willingness-to-pay amounts directly from individuals through structured

conversations. If securing this information from all citizens were too costly, surveys of population samples could be used as the basis for estimating aggregate willingness to pay. This approach is called 'contingent valuation.' It can be used to value impacts that involve active use benefits. More importantly, it is often the only way to value passive use benefits. Contingent valuation is often used to value environmental impacts (Bateman and Willis, 2000) (*see* Environmental Economics). A blue ribbon panel convened by the US National Oceanic and Atmospheric Administration concluded that contingent valuation could be a reasonable basis for estimating passive use values in natural resource damage assessment (Arrow et al., 1993).

Nevertheless, the use of contingent valuation remains controversial. One source of concern is the cognitive demands that it places on respondents in terms of understanding the policy being valued. Unless respondents understand what is being valued, and believe their answers to be consequential in influencing the policy choice, they cannot be expected to give meaningful answers. Another source of concern is the fear that respondents will answer strategically in the sense of giving false answers that they believe will lead to a better outcome for themselves than would result from truthful answers. Both theory and evidence suggest that giving respondents referendum-type questions about public goods minimizes the dangers of strategic responses. That is, rather than directly asking a respondent to state her willingness to pay, she is given a random dollar amount and asked if she would vote for the policy if it would cost her that amount in higher taxes or increased costs for other goods. An estimate of mean or median willingness to pay for the sampled population can be inferred statistically from sample responses.

Valuation of Costs

The market price of an input provides a good measure of the opportunity cost of that input if it is purchased in a competitive market and the project does not alter the market price of the input. For example, the purchase cost of books bought for a local reading project would equal their opportunity cost. However, the opportunity cost of inputs purchased in noncompetitive markets may be larger, smaller, or equal to their market price. For example, the opportunity cost of the time of people compelled to serve on juries may be larger or smaller than the legally set payments they receive from the court.

A commonly encountered problem in CBA is the measurement of the opportunity cost of labor that would otherwise be unemployed. This cost depends on the value to society of whatever the workers would give up if they were employed. They might not consumer leisure, or they might not clean the house or look after children. The wage they receive is likely to overestimate their opportunity cost. Alternatively, zero would underestimate their opportunity cost. Rarely do analysts have enough information about the value of the forgone opportunities to estimate accurately the opportunity cost of unemployed labor so they usually use some fraction of the accounting cost as an approximation (Haveman and Krutilla, 1968).

Markets in developing countries are often more distorted than markets in developed countries. The labor markets are often segmented and labor mobility may be restricted. Official exchange rates may not reflect the true value of national currencies, and there may be both 'formal' and 'informal' sectors. In developing countries, analysts often compute shadow prices using the LMST method (Little and Mirrlees, 1974; Squire and van der Tak, 1975; Dinwiddy and Teal, 1996).

Sometimes the accounting cost of an input is zero. For example, a government project may not pay any rent because it occupies space owned by a branch of the government. However, the opportunity cost is not zero and may be very large.

Discounting Future Costs and Benefits

The benefits and costs generated by a public program often extend over long periods. Because people are impatient, they would rather consume now than in the future and, therefore, they value goods and services they consume in the future less than if they were consumed in the present. Also, money has a financial opportunity cost: people can invest now and earn a positive real return, which would allow them to consume more in the future. For both of these reasons, analysts discount future benefits and costs.

Markets for lending and borrowing funds (also known as capital markets) balance the preferences of lenders who require a payment for giving up use of their funds (hence, delaying consumption) and the preferences of borrowers who invest in projects with future payoffs. This balancing results in a market interest rate, denoted as r. In an ideal economy, this market interest rate would equal, for each and every individual, their 'marginal rate of substitution' between consumption this year and consumption next year, denoted as p. Since $r = p$, it would be the natural choice for the 'social discount rate' (SDR), that is, the rate to discount benefits and costs in CBA and other methods of government project evaluation. The 'present value' of some benefit received or cost incurred in year n, denoted X_n, would be given by $X_n / (1 + r)^n$. The present value of the net benefits of a policy equals the sum of these amounts over all impacts in all time periods. Maximizing the present value of the net benefits would maximize allocative efficiency.

In practice, however, capital markets are distorted by taxes on savings, externalities, transaction costs, credit rationing, and inconsistencies in individual behavior. When such distortions exist, the choice of the discount rate method becomes more complicated. In fact, it is one of the most controversial topics in CBA (Burgess and Zerbe, 2013; Moore et al., 2013b). There are two main approaches.

The 'social rate of time preference–shadow price of capital' approach begins with the assumption that society should act as if it is maximizing the utility of a representative individual whose utility depends on his or her consumption in each and every time period. From this assumption, it follows that the SDR should equal the 'pure rate of time preference,' which reflects impatience, plus the growth rate of per capita consumption multiplied by the elasticity of the marginal utility of consumption with respect to consumption. The latter term reflects society's preference for more equality in per capita consumption over time than would otherwise occur. Moore et al. (2013a) suggest that, according to this method, the real

SDR should be about 3.5%. However, if this approach were adopted, some public projects might displace some private investments that would yield a higher return on investment. In order to correct this potential problem, flows in or out of private investment should be weighted by the 'shadow price of capital.'

The alternative approach is called the 'social opportunity cost of capital' method. It is based on the view that government projects should have a return higher than alternative (private sector) projects. Unlike the social rate of time preference method, this method derives the value of the SDR based on observed market rates. Specifically, it computes the SDR as a weighted average of the pretax return on investment (reflecting the opportunity cost of private investment), the marginal cost of borrowing (reflecting the cost of incremental foreign funding), and the posttax return on investment (reflecting the opportunity cost of displaced consumption) (Burgess and Zerbe, 2011). The pretax return on investment has the most weight. Using this approach provides estimates of the real SDR of about 5–7%.

Fortunately for practitioners, the difference in the recommended rates are not nearly as large as they used to be in the 1970s, although the choice of the SDR can make a difference between recommending for or against a project, especially for investments with large up-front costs and benefits that extend many years into the future. The decision about what rate to use depends on how one thinks government projects are funded. The social opportunity cost of capital method assumes that government projects primarily displace private investment. In contrast, the shadow price of capital method assumes that government projects are primarily financed by taxes, which reduce consumption.

Many environmental projects have very long-term impacts (*see* Sustainable Development: An Economic Perspective). The impact of climate change policies, for example, may be reflected in events many years from now. Many policy effects may span multiple generations. In these situations, it is generally agreed that analysts should use 'time-declining' discount rates. Thus, for example, an impact that occurs in 200 years would be discounted at a lower rate than an impact that occurs in the 'near future,' say 20 years. One potential criticism of this practice is that it would result in 'time-inconsistent' (or 'hyperbolic') discount rates. However, uncertainty about the future values of the parameters underlying the SDR implies a time-declining schedule of SDRs with only the lowest possible rates applying in the very long term (Weitzman, 2001).

Accounting for Uncertainty

As CBA involves prediction, it can rarely be done with certainty. The standard approach for dealing with 'uncertainty' is to estimate 'expected net benefits.' Analysts convert the problem from one of uncertainty to one of 'risk' by assuming plausible distributions of benefits and costs. They then find the expected value of net benefits. Consider a project with certain opportunity costs of $15 million and uncertain benefits. If there were a 20% chance of obtaining $5 million in benefits and an 80% chance of obtaining $20 million in benefits, the expected benefits would be $17 million and expected net benefits would be $2 million. Under the assumption that society is risk neutral, the analyst can treat the expected values as if they were certain amounts and would recommend a project if it's expected net benefits were positive.

The calculation of expected net benefits, however, does not fully take account of individual preferences for risk. Individuals may not be willing to trade certain amounts of money for expected values of the same magnitude. In such cases, the appropriate measure of benefits is 'option price,' the individual's willingness to pay for the particular distribution of outcomes associated with a policy (Graham, 1981).

As individuals are generally risk averse, policies that reduce risk generally have option prices larger than expected benefits. The difference, 'option value,' is a premium individuals are willing to pay for the reduced risk. As option price can only be elicited through contingent valuation surveys, it is rarely estimated. Unfortunately, relatively little progress has been made in the theoretical determination of the magnitude or even sign of option value. Option value is likely to be reasonably small and expected net benefits is likely to be a reasonably good approximation of option price when it is possible to insure against the relevant risks, different people realize different outcomes from the project and each person is affected by a diversified portfolio of projects whose social returns have low correlations with each other.

The Maximum Expected Net Benefits Rule

Assuming that all of the costs and benefits of a policy have been correctly identified, measured, discounted, adjusted for uncertainty, and aggregated, positive expected net benefits indicate that the policy is potentially Pareto improving, i.e., will increase allocative efficiency. Where there are many alternative, mutually exclusive projects, the analyst should recommend the project with the largest expected net benefits. That project may or may not have the largest benefit–cost ratio. Because benefit–cost ratios vary with the size or scale of projects, they should generally not be used to select among mutually exclusive projects.

In the special case of completely independent projects, all those with positive net benefits should be selected. In this case, this rule corresponds to the rule of selecting all projects with benefit–cost ratios greater than one. If, in addition, government is financially constrained, it should allocate more money to projects with larger marginal net benefits per dollar. In fact, it should allocate money to projects so that the marginal net benefits of an additional dollar of all projects are equal (and greater than one). Of course, if these marginal net benefits per dollar were greater than one, allocative efficiency would be increased by relaxing the fiscal constraint (i.e., by raising taxes).

Sensitivity Analysis and Distributional CBA

Every CBA contains some predictions and some estimates. Impacts may not be predicted accurately and impacts may be valued incorrectly. There is some disagreement over the appropriate value of the SDR. It is common, therefore, for

analysts to test how sensitive their recommendations are to particular assumptions. This process, called 'sensitivity analysis,' typically involves changing the assumed values of a few key parameters to see how net benefits change. Some analysts perform 'Monte Carlo simulations' in which many parameters may vary simultaneously.

One way to incorporate equity into CBA is to attach different weights to different individuals. Thus, for example, disadvantaged children may be given a higher weight than the rest of society. Or, one might want to weight consumers more than producers if, for example, firms are partially foreign-owned. In practice, however, analysts rarely know how much weight should be given to each group. In such situations, it is useful to present the distributional consequences of a proposed policy in addition to the CBA based purely on efficiency. Such a display enables decision makers to perceive fully the distributive implications of the proposals being discussed.

Cost-Benefit and Cost-Effectiveness Analyses in Evaluation Research

Brian T Yates, Department of Psychology, American University, Washington, DC, USA

Abstract

Cost-benefit analysis (CBA) and cost-effectiveness analysis (CEA) are used increasingly in both clinical trials of health and human services, and in evaluations of programs to determine their future funding. Definitions of CBA and CEA are given and contrasted with each other and with requests for 'cost analyses' and 'efficiency' studies. The emerging importance of cost-utility analysis is noted as well. Emerging directions in cost-inclusive assessment are noted, including evaluating costs of using different services to add Quality-Adjusted Life Years and Disability-Adjusted Life Years – nonmonetary measures that can be almost as useful for comparing outcomes of diverse programs as monetary measures, i.e., program benefits. Advantages of conceptualizing 'costs' more broadly as the value of the specific types and amounts of resources used to provide services are explained. Ethical problems in cost-inclusive evaluation are highlighted, and possible solutions suggested. Viewing CBA and CEA as crucial parts of improvement-oriented operations research is recommended. Links for manuals and Web sites for cost-inclusive evaluation in health and human services are provided.

Definitions

Cost-benefit analysis (CBA) and cost-effectiveness analysis (CEA) are two related methods for social scientists and program evaluators to incorporate data on resource requirements of, and resources generated and saved by, social services. At their most basic, both forms of cost-inclusive evaluation compare the value of resources invested in an activity to the value of the outcomes of that activity (Yates, 2009). The activity being examined for cost-benefit or cost-effectiveness can be anything from introducing free health services in a remote village to global eradication of an illness. Persons and organizations can use findings from CBA and CEA to decide whether to engage in or continue an activity and how much time, money, and effort to devote to it. Using different stakeholder perspectives to define, measure, and compare costs, benefits, and effectiveness can result in different findings, different funding, and different impacts for individuals, communities, and human society.

As resource constraints increase, a health or human service tends to be funded only if total benefits of that service exceed total costs of that service by a substantial amount – and relatively soon. Conceptualizing services as human rights or entitlements can drive decision-makers to select the least costly activity, paying less attention to outcomes. This can be unwise: social scientists have developed reliable and valid means of measuring most program outcomes, and of comparing the monetary value of those outcomes over time to program costs over time.

Program Evaluation

Answering questions about how faithfully a program is being implemented, whether its goals are being achieved, and whether the resources devoted to program operations are being used in the most worthwhile manner, all can be considered forms of program evaluation (cf Posavac, 2011). Many research strategies can be used to answer these questions, ranging from expensive and possibly invasive randomized clinical trials to often less expensive but sometimes less valid quasiexperiments (American Evaluation Association, 2013; Shadish et al., 2001). Program evaluation often involves experts from diverse disciplines who apply quantitative and qualitative means of judging programs as they currently operate (*summative* program evaluation), and of improving programs so they operate better (*formative* program evaluation; cf Yates, 1996).

Goals, Effectiveness, Efficacy, and Efficiency

Evaluating the degree to which an activity's desired outcomes or *goals* are being achieved is a judgment of the *effectiveness* of the activity. Activities shown by research to be promising are bundled into programs designed to prevent or remediate problems. Researchers monitor the *fidelity* with which each activity is implemented by highly trained program provider. Persons receiving program services (*clients*) may be assigned randomly to either the program or various control conditions to allow effects of other events, of measurement itself, and of client expectations to be separated from the unique contributions of the program. Participants also may be screened so they have similar characteristics – sometimes so they have only the problem the program is designed to remediate, such as depression, and no other comorbidities, such as anxiety or diabetes. Under these controlled and, some would say, unrealistic conditions, the maximum effectiveness or *efficacy* of the program is measured. When implemented later by providers with varied training and more demands on their time, for clients with combinations of problems, and in programs that must not consume more resources than they will be reimbursed, the *effectiveness* of the program in the 'real-world' is evaluated. Often *effectiveness* is less than *efficacy*.

The 'efficiency' of a program can be distinguished from both its effectiveness and efficacy. In some contexts, 'efficiency' refers to how well the program uses those resources currently available in its environment. This usage resembles *cost-effectiveness* and *cost-benefit* (e.g., Marseille et al., 2004). Other meanings of 'efficiency' may include simple cost per student or cost per patient. Again, 'efficiency' does not have one widely accepted definition, although it appears in speeches about program costs about as often as, and sometimes interchangeably with, 'cost-benefit' and 'cost-effectiveness.' One even hears 'cost-efficiency.'

Actually, *cost*, *cost-benefit*, and *cost-effectiveness* all are terms with specific definitions.

Cost Analysis

An entreaty for 'cost-efficiency,' 'cost-benefit analysis,' or 'cost-effectiveness analysis' often is a request for greater attention to program costs and not a thorough analysis of relationships between costs and benefits or costs and effectiveness. In program evaluation, *costs* usually refer to the total monetary value of the many resources consumed by program activities. A *cost analysis* compares programs purely on their costs, often assuming that any differences in program benefits or effectiveness are minor or unmeasurable. If programs provide entitlements such as income support, aid for children, or health services, program outcomes may not even be measured. Evaluating programs according to their costs but not their outcomes does, of course, risk funding programs that cost the least but also deliver the least, to the extent that program outcomes are functions of the types and amounts of resources available to the program. It also is possible that more-costly programs deliver poorer outcomes than less-costly programs (e.g., Yates, 1994).

Usually *cost analysis* focuses on only the *monetary* value of activities performed by providers. Comprehensive cost analysis performed from the perspective of society considers donated resources such as time volunteered by interns and underpaid providers, and clients.

Benefit Analysis

In cost-inclusive evaluation, *benefits* do not refer to positive outcomes in general, but only monetary outcomes. Most providers of health and human services are trained to focus on changing key client processes and proximal outcomes rather than more distal outcomes. For example, a psychologist may implement activities within cognitive-behavioral therapy and attend primarily to the immediate results of those activities, such as whether the problematic thought patterns changed and anxiety diminished. Outcomes of greater interest to health insurers, employers, and family members might be reduced use of health services due to decreased need, less self-medication with alcohol and other drugs, increased days worked, improved productivity or profitability, and greater availability to provide child- or elder care. These outcomes are typically what programs are funded to achieve. They are either monetary or readily monetizable using methods detailed in monographs (e.g., Gold et al., 1996; Drummond et al., 2005; Yates, 1980, 1996, 1999). All are termed *benefits* and are summed to describe program outcomes to third parties, i.e., to entities other than the client and provider. These can include *negative benefits* such as increased use of health and other human services following treatment, which can be viewed as undesirable by third parties but as ideal by practitioners, clients, and consumer advocates.

Cost-Benefit Analysis

Once summed, the monetary value of activity outcomes can be compared to the total monetary value of resources contributed by providers, clients, and others because those outcomes and resources were measured in the same units. The resulting difference (benefits minus costs or *net benefit*) and ratio (benefits/costs) seem easy to understood and use when choosing among programs to fund (e.g., Yeh, 2009). Programs may differ in whether they are cost-beneficial or not, i.e., whether their net benefit exceeds 0 or their benefit/cost ratio exceeds 1. Programs also can differ in how *much* their benefits exceed costs, either in absolute or relative values, and how soon this can be expected to occur. Because 'benefits' precede 'costs' when describing formulas for both net benefit and benefit-cost ratios, cost-benefit analysis (CBA) might be more understandably termed *benefit-cost analysis* or BCA. The benefit can be seen as a *return* on investment, social or individual, and the amount and speed of that return relative to the value of resources spent is the *return on investment* or ROI. Returns on investment that occur several decades after resource expenditure, as is common in prevention and education programs, are not as valuable as the same returns occurring sooner. This difference is routinely quantified by adjusting temporally distant returns downward for their *net present value* using a *discount rate* to express the return that would have been achieved if the same resources had been invested in alternative activities. Several discount rates are used, resulting in not one but several 'bottom lines' when time to ROI (TROI) and total amount of ROI are reported.

Neglecting certain costs or ignoring particular benefits can, of course, alter indices of cost-benefit to support decisions that later prove to be incorrect. Also, some outcomes are difficult to convert into monetary units, especially in a manner that does not allow under- or overrepresentation due to subjective values of the evaluator or decision-maker. Moreover, some services are considered rights to which all persons are entitled regardless of whether they are or are not found to have benefits which exceed costs. These entitlements include, in many areas of our world, healthy air and water, adequate and nutritious food, opportunities for physical activity, reliable shelter, child- and elder care, protection from physical harm and property theft, comprehensive health care, access to information resources as provided by libraries and the Internet, universal education, opportunities for fulfilling employment, income maintenance when one is not employed, liberty, and happiness (cf United Nations, 2014).

Cost-Effectiveness Analysis (CEA)

When nonmonetary and nonmonetized outcomes are compared to monetary costs for a single program, simple differences or ratios do not yield the same simple decision aids as net benefit or benefit-cost ratios because outcomes are measured in different units than costs. Calculating the 'cost per' unit of nonmonetary outcome may not seem sensical at first unless two or more programs are being compared, but consider the potential usefulness of knowing the *cost per drug-free month* when comparing substance abuse treatment programs, or even the *cost per pound lost* when comparing weight-loss regimens. This is different than 'cost per patient-filled bed,' unless simply filling a bed is the outcome of interest. To be clear: 'Cost per student' would be a measure of cost only. 'Cost per student who graduated with scores exceeding minima required' would be a measure of cost-effectiveness.

Cost-Utility Analysis

An increasingly common form of cost-effectiveness analysis (CEA), *cost-utility analysis (CUA)*, uses nonmonetary measures of outcome that can be applied to many programs. Essentially, program outcomes are measured as not program-specific measures such as 'apples' or 'oranges,' but as more general 'fruits.' (Programs are, of course, free to also report outcomes on more specialized measures, e.g., 'apples,' 'oranges,' or 'lemons.'). *Well-being* is a commonly advocated outcome for which there are useful measures (cf Drummond et al., 2005). Critics deride well-being as too subjective and as difficult to measure with acceptable reliability and validity.

A cost-inclusive index more agreeable to many than net cost or benefit-cost is *cost per year of life saved*. Diverse programs can be compared in terms of years of life saved. In recognition that the subjective value of a year of life can be less if one is seriously ill and suffering, years of life saved usually are adjusted for *quality*. Accepted algorithms are used to calculate *quality-adjusted life years* (QALYs; cf Gold et al., 1996). Careful research can determine the change (hopefully improvement) in QALY produced by different medical or other interventions (e.g., Freed et al., 2007). Combining measures of gain in QALY with information on the costs of activities that seem to cause those gains results in estimates of the cost of adding a quality-adjusted year of life for patients, or *cost per QALY* (e.g., £/QALY). Similar metrics that include costs can be used to compare the cost-benefit of prevention versus treatment, and health interventions versus efforts to improve quality of life through education, the arts, income support, and more.

A related measure is years of life lost due to disability caused by health and mental health problems and premature death: *DALY*. The DALY combines findings regarding program effects on mortality and morbidity into a single variable: a combination that can facilitate higher-level decisions about funding of public health interventions. Costs of efforts to reduce disability and premature cost often are expressed as *cost per DALY* saved.

Schools of Thought and Leading Advocates

CBA and CEA can be viewed as methods of making difficult decisions in which some individuals gain resources or services at the expense of others. CBA and CEA promise a decision process that is fair because it attempts to weigh social investment against social gain objectively and quantitatively. Critics note that this logical positivist framework has been shown to generate decisions that are fundamentally subjective and that often benefit persons and organizations that have the largest monetary stake in the decision (cf Guba and Lincoln, 1989). The critical, constructivist position makes rejection of cost considerations easier for researchers, service providers, advocates, and consumers who would rather not include costs of services or their monetary consequences decisions about which services to fund and offer, or defund and stop.

Nevertheless, as long as there are limits on the availability, quality, and amount of resources needed to provide services and produce products, the amount of those resources needed for a social program will factor into any realistic decision-making. Evaluations and decisions based on at least the monetary value of those resources will continue to be made, informally at least. CBA and CEA can make the measures and biases of each stakeholder group explicit for all to see. The process by which those resources are valued and monetized can be transparent. In addition, CBA and CEA consider outcomes of human endeavors as well as their costs.

Some critics of human services seize upon program evaluation in general, and CBA and CEA in particular, as a means of challenging the worth of human services and especially entitlement programs. Providing treatment to substance abusers, for example, can be challenged as a waste of public funds. This position has been refuted by findings that substance abuse treatment can cause a subsequent *decrease* in use of expensive health and other human services (Ettner et al., 2005). Concern remains about the cost-benefit and cost-effectiveness of other services, such as free health services and income maintenance. Resolving these issues can be facilitated by cost-inclusive evaluations that are well beyond the scope of this article. Finally, many cost-effectiveness and cost-benefit analysts recognize that their findings should not be the sole criteria on which decisions should be based. Again, we all have fundamental rights which no evaluation should deny any of us.

Changes in Focus or Emphasis over Time

CBA can be viewed as having always been a normal part of most individuals' pragmatic decision-making, in which what is required by an enterprise is compared to what may come of that enterprise. In modern European history, the first formal proposal of CBA was made by Dupuit, a French engineer. While cost-inclusive evaluation in health, substance abuse, and criminal justice has proceeded quickly to approximate the complexity of CBA required to justify dams and other projects by the US Army Corps of Engineers in the 1930s (U.S. Flood Control Act), other human services are only now beginning to measure and compare costs and outcomes carefully and comprehensively. Mental health and substance abuse treatment have a surprisingly long history of advocating, training, and using CEA, and to a lesser degree CBA (e.g., Carter and Newman, 1976; Fishman, 1981; Sorensen and Phipps, 1975; Yates, 1977, 1978). Services for children and families have developed a series of manuals to help programs and researchers assess costs (Dickey et al., 1999; Calculating the Costs of Child Welfare Services Workshop, 2013), but efforts to assess cost-effectiveness and cost-benefits of these and many other human services have only thin histories of cost-inclusive evaluation (cf Levin and McEwan, 2001; Persaud, 2007; e.g., Yates, 2005; Yates et al., 1979).

Some state legislatures in the United States have used CBA to control the amount of funds consumed in health and other human services, especially those that might reduce future costs for criminal justice or health services (cf Pew Charitable Trusts, 2013). Best known are the CBA conducted by Steve Aos and colleagues in response to requests from the Washington State legislature (Washington State Institute for Public Policy, 2011).

As in other areas of program evaluation, 'thumbs up or thumbs down' evaluations have only begun to evolve into 'how can we make it (even) better?' evaluations. Because funding of programs increasingly depends on whether the program meets criteria such as a cost-benefit ratio that is well above 1.0, or a maximum cost per QALY (e.g., Towse, 2009), much expertise has been devoted to standardizing the measurement and calculation procedures. Starting with Gold et al. (1996) and continuing through Yates (1999) and Drummond et al. (2005), consensus is being achieved on more methods. The need for cost-inclusive evaluation has been recognized widely, resulting in an increasing number of submissions to professional journals of CBA and CEA in health and other human services (cf Herman et al., 2009; Yates, 1994).

Current and Emerging Directions in Theory and Research

Utility Assessment

A major advance in cost-inclusive evaluation has been the adoption of outcome measures that are not monetary, but that are standardized across diverse services, such as the QALY and DALY introduced earlier. These measures promise to evolve into a common metric of outcomes that will allow a great diversity of human services to be compared for cost-effectiveness.

Willingness-to-pay to obtain a service and willingness-to-accept withdrawal of a service have been advocated as a measure of the worth of a program since CBA was first formalized (cf Johansson, 1995). Part of the appeal is that this outcome is consumer-driven and could be inexpensive to measure. The willingness-to-pay approach to outcome assessment seems particularly oriented toward business models of social enterprises originating in unabashedly capitalist contexts. While consumers' willingness-to-pay for services and products may be a useful metric when the decision-maker is construed as highly rational and able to pay a range of prices, considerable efforts have been exerted by communications specialists in advertising and politics to distort consumer perceptions.

Willingness-to-pay seems a poor choice for valuing outcomes when consumers seek or are prescribed services precisely because their recent choices do not seem entirely rational, as may be the case for substance abuse, mental health, and criminal justice services. Not having sufficient monetary resources to consider investing in services that may not benefit the consumer for years or decades has led many families to educate only some of their children, a choice that reflects willingness-to-pay but seems a poor choice for society in the long run. Asking economically disempowered consumers to 'imagine' they had a certain amount of resources to invest in services may not generate the rational decisions anticipated, but is likely to uncover deep frustration about economic hardships.

BCA Using Nonmonetary Units

As noted earlier, the primary advantage of CBA over CEA is that costs 'input' and outcomes 'output' are measured in the same units. This allows costs to be subtracted from outcomes to calculate net benefit. It also allows calculation of the *ratio* of outcomes to costs. Costs and benefits of different activities within a program can be assessed in the same nonmonetary units, using similar rating scales for *psychological cost* and *psychological benefit* (cf Yates, 1978). The result provided clinically useful information on client perceptions of which activities were best and worst in a weight-loss program. Similar nonmonetary CBA could be used in group decision-making to allow explication, quantification, and comparison of different program activities consumers and providers perceived to be least difficult and most helpful.

Evidence-Based Practices

Although preferences in training as well as funding have emerged for activities that careful research has shown to produce the outcomes they target, information on the costs of those *evidence-based practices* is rarely reported. The only evidence that seems to matter is nonmonetary effectiveness, and neither benefit nor cost. Many activities, done often and well enough by highly trained professionals working intensively and individually with clients in controlled settings, can be shown to meet criteria for specific outcomes. Calls for including costs and benefits among the evidence for specific practices have gone largely unanswered to date (Yates, 2012a).

For replicability alone, it would seem important to include in descriptions of evidence-based practices careful specification of the types and amounts of each of the key resources needed to implement such a practice. Many human service fields could benefit from reporting the resources needed for a specific evidence-based practice so as to allow researchers and practitioners to estimate the costs of those resources in current monetary values and in their settings (Yates, 1996). Including monetary outcomes, i.e., benefits, when measured, as well as common indices such as QALY and DALY added or saved, could advance the adoption and funding of promising practices.

Requiring inclusion of information on service resources consumed, and their costs, also could encourage researchers to not stop once they have found evidence that a program works. The next step in helping a practice become practical may be to then remove activities that are less responsible for program outcomes, leaving only those that are necessary. This 'efficiency services research,' as it might be called, also could determine the intensity of activities needed to achieve outcomes – for example, whether biweekly rather than weekly meetings were sufficient, and whether trained paraprofessionals rather than psychologists and physician's assistants rather than physicians could implement the essential activities.

Of course, one can also ask for evidence that inclusion of costs in evaluation research is itself effective, and whether it helps to maintain and improve service outcomes. It would be hypocritical not to also ask, is CEA cost-effective? … Is CBA cost-beneficial? These issues of meta-cost-inclusive evaluation research have only begun to be broached empirically (cf Herman et al., 2009; Yates and Taub, 2003).

Methodological Issues and Problems

Costs and Outcomes: Biases in Comprehensive Measurement and Monetization

A persistent and widespread problem in cost-inclusive evaluations is careful measurement of both costs *and* outcomes in the same study and in a standard manner (Siegel et al., 1996). Adding monetary outcomes to reports, and contrasting them with monetary costs, has led to major improvements in use of cost-inclusive evaluation. Most cost-inclusive evaluations and research reports focus on measuring, monetizing, and analyzing either resources invested or outcomes produced but rarely both with equal thoroughness.

Unfortunately, although greater attention has been devoted in the past decade to monetizing outcomes of human services such as substance abuse treatment and prevention of criminal behavior, including careful adjustments of outcomes for quality of research design, costs of such services have been accepted largely at face value. Costs not only need to be adjusted for changes in monetary value over time, such as inflation or deflation, but also can vary between urban and rural regions and can depend on whether the program is offered under the auspices of a larger institution or is a 'stand-alone' operation.

Costs: Monetization of Volunteered and Donated Resources

If costs are undermeasured, programs may seem to be more cost-beneficial, cost-effective, or to have greater cost-utility than is actually the case (Yates, 2012b). Because funding flows more to programs whose outcomes are reported to exceed costs to greater extents, there are strong incentives to measure benefits more comprehensively than costs.

Efforts have been made to standardize measurement of costs using principles of accounting and economics (e.g., Caffray and Chatterji, 2009). French's work is the best known (e.g., French, 2003; McCollister et al., 2009). Paper-and-pencil, computerized, and structured interviews seem to generate more reliable cost data than other methods (cf Zarkin et al., 2004).

Budgets and even accounting records can be poor sources for data on how funds were actually spent, however. Most cost measures used in contemporary CBA, CEA, and CUA neglect entirely what is perhaps the most necessary and widely used resource of all: the time of volunteer providers, and of the clients and family members who transport themselves and others to and from service sites, plus costs associated with transportation vehicles. Accounting records rarely include amounts and estimated values of these 'invisible' but necessary resources.

Some researchers have included measures of volunteered and donated resources (e.g., Yates et al., 2011), and resources devoted to treatment by clients as well (e.g., McCollister et al., 2009). These studies have found substantially different relationships between costs and outcomes when these oft-ignored resources are monetized. For example, cost-inclusive evaluations of consumer-operated services found that the monetary value of volunteered and donated resources exceeded the monetary budget of some consumer-operated human services (Yates et al., 2011). Fears that the cost of these programs would be exaggerated relative to programs that did not include volunteered and donated resources prompted. Yates and colleague Freed to report volunteered and donated resources separately from 'cash costs,' allaying some program's concerns and defusing resistance to collection of resource data.

Costs: Itemization in Reporting to Allow Generalization by Readers

Many articles and manuscripts describe in only a summary manner how cost and benefit data were collected. Reporting of cost evaluation methodology often is so minimal that, if same were done for nonmonetary outcomes, reviewers would reject it immediately. If cost- and benefit-assessment methods were reported in detail sufficient to allow replication by other researchers, cost-inclusive assessments could be more useful to readers and researchers in other countries and at future times. Costs and benefits should be itemized when reported, and quantified with their 'native units,' e.g., hours, square meters, and improvement in days employed, rather than just 'dollars invested' and 'dollars generated and saved.' In addition to reporting the total cost of a treatment program, the specific resources used should also be specified (e.g., X hours per week of direct services by a social worker, for instance) along with the pay rate (salary + benefits) in effect at the time data were collected (cf Sava et al., 2009).

This would allow decision-makers in other monetary systems operating a decade or more after publication of research findings to estimate the costs of each resource used and the value of each benefit generated. Without this, an intervention that has superior cost-benefit or cost-effectiveness to another intervention in one economy may be overgeneralized to be superior in other economies, which have such different pay rates as to reverse which intervention is more cost-beneficial and more cost-effective (e.g., Sava et al., 2009; cf Yates, 2011). Similar itemization of benefits would allow adjustment and potential similar reversals of cost-benefit findings for countries that apply different charges for emergency room, inpatient, and outpatient services.

Outcomes: Monetization of Lifetime Earnings Can Exacerbate Discrimination

Monetization of program outcomes often includes not only savings in future health and criminal justice services that will not be required because of program impact, but also increments in future earnings that result from training, education, or longevity enhancement. This income + benefits calculation is common in evaluations of the worth of a college education as well as estimation of DALY generated by some health programs. If some genders, ethnicities, or age groups use more expensive health or criminal justice services, savings in use of those services would be larger for, and favor focusing efforts on, those particular genders, ethnicities, or age groups.

That may seem fair, and certainly monetizing the expected enhancement of lifetime earnings acknowledges the importance of employment and entrepreneurship. This same approach to monetizing outcomes also could perpetuate or worsen historical discrimination that, for example, pays males more than females, some ethnic groups more than others, and

certain age groups more than others. Increments in lifetime earnings usually favor efforts to enhance income of younger individuals because they have more years of life to accumulate larger totals of improved earnings. Some readers may observe that ageist, sexist, and racist preferences simply reflect the values that society has already placed on the worth of different individuals' lives. Others may react to this issue by rejecting cost-inclusive evaluations entirely. It seems possible, however, that adjustments could be made to wage rates so that the same rate was used for all ages, genders, races. The youth preference inherent in measures of lifetime earnings could be reduced by calculating benefits to include (1) the commonly observed diminution of intervention effects over years of life, (2) savings in services to the aging that may result from their continued employment, and (3) monetary valuation of volunteer activities including child care and mentoring by the aging.

Costs and Outcomes: Statistical Models Capture Uncertainty, but Cost-Inclusive Indices Seldom Do

Even if they include volunteered and donated resources, and benefits assessed from multiple perspectives, cost-inclusive evaluations may report only total costs and total benefits for a program. This highly efficient method does not reflect the dramatic variability of response to program activities between individual clients whether those are persons, families, communities, nations, or regions of the world. Expressing that variability can be problematic, in that it introduces uncertainty and another statistic next to what was a rather neat single number: the benefit-cost or cost-effectiveness ratio. High variability that deviates from the typical bell-shaped curve of the 'normal' distribution, and which does not disappear even with large samples, seems all too typical of health and other human services. This interindividual and intersite variability seldom is reported by researchers or recalled by funders when using cost-inclusive indices to make funding decisions.

Even worse, small differences between mean or median costs, benefits, and net benefit for competing programs are too often interpreted as 'real' because of the dollar or pound signs involved, when the uncertainty in costs and benefits introduces sufficient variability as to render statistical tests of these apparent differences profoundly nonsignificant, or at least the differences in their effect sizes trivial.

Uncertainty of cost-benefit and cost-effectiveness can, of course, be expressed with confidence intervals, and its effects can be examined in analyses that simulate cost and outcome variability. One comparison of special interest that is rarely reported is against a net benefit of 0, and a benefit-cost ratio of 1.00. In the author's experience, some apparently substantial mean and median net benefits and promising benefit-cost ratios prove to be statistically or realistically the same as 0 and 1, respectively!

Benefit-Cost and Cost-Effectiveness Ratios Do Not Describe Relationships Over a Range of Values

A long-recognized but seldom solved problem with ratios that include costs is that they are expressions, which discard information on both costs and outcomes and provide only an expression of the relationship between those, and often just in one specific context. For example, Program A might have cost $100 000 per year and have generated $200 000 in outcomes. It would have a net benefit of $100 000 and a benefit-cost ratio of 2:1. Program B might address the same sort of problem but cost only $50 000 with $150 000 in outcomes. The net benefit is still $100 000 but the benefit-cost ratio is 3:1. Is Program B better than Program A? Maybe. But suppose Program B was now funded for $100 000 rather than $50 000. Could we expect that the same benefit-cost ratio of 3:1 would hold at the higher level of funding? Not necessarily. Typically there are diminishing returns on investments in a given program and a given technology, and even on investments in progressively more impactful technologies (cf Yates, 1978). Ratios of benefit/cost, effectiveness/cost, or cost/QALY are but transient slopes at a particular cost value of a potentially complex and even nonmonotonic cost-outcome function at that one moment of measurement (Yates, 1996).

Maximizing Cost-Benefit, Cost-Effectiveness, and Cost-Utility

Operations research has long been used in military and business settings to maximize outcomes, such as product deliveries, within resource constraints. Operations researchers first construct mathematical models that quantify the contribution to overall outcomes made by each activity within the program. These activity-specific cost-effectiveness or cost-benefit indices are part of this model. The amount of each type of resource used in each activity also is captured in the model, along with the total amount of each resource type that is available in the context in which the program operates. Linear programming then manipulates this resource-activity-process-outcome (RAPO) model to either maximize overall outcome within the resource constraints, or minimize the overall cost of achieving a targeted overall outcome.

Cost-inclusive evaluators have long understood that CEA and CBA can be preliminary stages of operations research (Yates, 1980, 1996). Sufficiently detailed models have only recently been applied to determine the most cost-effective solutions to complex and socially significant health problems such as HIV prevention and treatment (cf Lin et al., 2012). Yates and colleagues (Yates, 1997) have attempted to isolate, measure, and quantify relationships between (1) *resources* consumed by a program, (2) the *activities* that program uses to engage clients so that (3) specific biological, psychological, and social *processes* are instigated, enhanced, diminished, or eliminated such that specific (4) nonmonetary and monetary *outcomes* are achieved, both proximally and distally (cf Yates, 1999). This model promises to facilitate application of linear programming and other operations research solutions to problems of program optimization. It has also facilitated understanding of program failures (Yates, 2002).

Social Return on Investment (SROI): CBA Anew

The SROI approach to improving society is used to fund those health, education, and other efforts that are most likely to yield the best return for society. This form of CBA can be used by private and public agencies at local, national, and international levels to decide how to best allocate their limited resources.

Ideally, SROI analyses identify not only the time to return on investment but also use measures that funders have agreed are valid in a global context. Ideally, SROI allows the same funds to be used repeatedly as monetary resources are converted to societal resources that also have monetary value. The later could include traditional benefit measures such as improved productivity and reduced use of health care, both due to the decreased in physical or mental dysfunction and engendered by enhanced well-being and creativity. Questions can be raised about how soon and how completely these and other social resources can be recognized as monetary resources available for new investments. Arguably, private and public entities should allow and fund all efforts that can be shown to have returns that, after adjustment for any delays, exceed by a confident amount the investment require.

Of course, errors and biases in measurement of benefits and costs noted earlier can substantially distort SROI decisions – a problem that proponents of SROI address by advocating involvement of all stakeholder perspectives, careful monetization, and validation of findings. Eschewing the subjective and measuring only what is 'material' is a principle that risks making decisions that damage health while increasing capital. Fortunately, SROI specialists are both aware of this danger and working on solutions. This is, perhaps, the most novel and promising application of CBA and CEA in contemporary settings.

Abstract

Scholars and mental health professionals have argued that racial–cultural issues are obstacles for those seeking help. When available, cross-cultural counseling has focused on misunderstanding client health beliefs and cultural customs, practitioners' historical, social, and political unfamiliarity with discrimination, professional cultures, biased theoretical models, and failure to create realistic understandings of members of racial–cultural groups in the USA. Recognizing the importance of meeting the needs for all who seek mental health services, cross-cultural scholars and educators have been providing direction in cross-cultural psychology research, practice, and training. Competency guidelines and ethical and professional mandates have come from these efforts. Unfortunately, emanating from a cultural pluralism perspective, cross-cultural psychology has often resulted in overgeneralized and homogenized group stereotypes without attention to within-group variation and individual differences. A transition from cross-cultural toward socially constructivist multicultural psychology has been gaining momentum that shifts learning from cognitively perceived culture-specific group norms to an integrated cognitive-affective racial–cultural identity perspective that includes social, historical, and political frameworks. Understanding personal racial and cultural identities and developing self-acceptance as the means for respectfully and competently working with people from all racial–cultural groups has become the primary and necessary prerequisites for developing multicultural competence in the twenty-first century.

Competency guidelines and ethical and professional mandates have come from these efforts. Unfortunately, emanating from a cultural pluralism perspective, cross-cultural psychology has often resulted in overgeneralized and homogenized group stereotypes without attention to within-group variation and individual differences. A transition from cross-cultural toward socially constructivist multicultural psychology has been gaining momentum that shifts learning from cognitively perceived culture-specific group norms to an integrated cognitive-affective racial–cultural identity perspective that includes social, historical, and political frameworks. Understanding personal racial and cultural identities and developing self-acceptance as the means for respectfully and competently working with people from all racial–cultural groups has become the primary and necessary prerequisites for developing multicultural competence in the twenty-first century.

Introduction

Scholars and mental health professionals have argued that racial–cultural issues have been obstacles for those seeking help (Sue and Sue, 1999). When counseling has been available, the focus has often been placed upon failures to create realistic understanding of members of racial–cultural groups in the United States, practitioners' unfamiliarity with historical, social, and political discrimination and oppression (Guthrie, 1998), narrow professional cultures, and biased theoretical models (Carter, 1995).

In many regards, scholars, educators, and practitioners have been focusing upon changing population demographics as a driving force necessitating multicultural inclusion. For example, the US Bureau of the Census data (1990) has shown significant increases in the number of Blacks, American Indians, Asian/Pacific Islanders, and Latinos. Between 1970 and 1990, the Latino population increased 145%, the Asian/Pacific Islander population by 375% with 22.3 million Latinos and 7.2 million Asian/Pacific Islanders now living in the USA. Currently one in three US Americans has been either born outside of the USA or are members of visible racial–cultural groups. Given the present rate of immigration as well as fertility rates, researchers at the Bureau of Immigration have predicted that by the year 2040 Whites will only comprise 62% of the total US population.

Recognizing the importance of meeting the needs for all seeking mental health services, scholars and educators have developed competency guidelines and ethical mandates for integrating multicultural perspectives into psychology research, practice, and training (American Psychological Association, 1991; Sue et al., 1982, 1992, 1998), educational programs (Carter, 1995; Ridley et al., 1994), and evaluation instruments (Pope-Davis and Dings, 1995).

Culture

What is culture? Culture at its core understands human behavior through causes and effects *and/or* content and

processes. While cultural content is focused on knowledge about learned and acquired beliefs, art, morals, customs, and habits, cultural processes attend to the process and perpetuation of pattern transmission. Thus, psychosocial cultural perspectives are socially transmitted attitudes and behaviors emerging from interpersonal interactions transmitted generationally, not through biological inheritance but by formal and informal methods of teaching and demonstration. Thus, culture can include historical dimensions emphasizing traditions, normative dimensions focusing upon unique and shared experiences, psychological dimensions including adjustment, learning and group behaviors, structural dimensions attending to the composition of and interrelated patterns in organizations, and genetic dimensions focusing on the origins of culture as interactive adaptive processes between groups and their environment. Broadly speaking, culture has bound groups of people by common explicit (e.g., tangible artifacts, clothing, food, festivals, and behaviors readily observed by outsiders) and/or implicit (e.g., intangible conscious and unconscious values), assumptions, attitudes, beliefs, and feelings and has endured over time and space. Additionally, while people may be identified with one or more groups, the intensity and resilience of belongingness can vary with the interaction of self-investment and degree of group acceptance.

How people's racial–cultural assumptions shape the way in which culture is embraced, rejected, and ignored has been described in Carter's (1995) classification system. In the *Universal* paradigm, shared similarities are affirmed as universal human experiences and differences as secondary intragroup variations. In the *Ubiquitous* paradigm, socially derived circumstances constitute cultural groups. From this perspective, people embrace one or more socially derived cultural group affiliations. Unlike the Universal paradigm, the Ubiquitous paradigm acknowledges and accentuates differences by promoting cultural sensitivity to increase people's awareness of variation. Influenced by anthropology, the *Traditional* paradigm equates culture with geography (e.g., country) and adaptive socialization (e.g., birth, upbringing). As cultural membership circumscribes personality development by experiencing 'cultures' through exposure and cultural informants, culture is understood as personal circumstances superseded by the dominant culture. In the *Race-based* paradigm, culture is a function of transcending racialized experiences. Becoming aware of the effects of racism, oppression, and promoting racial identity development, culture is understood by how race and racism influence power and authority in the USA. In the fifth *Pan-National* paradigm, culture is constructed as how racial group affiliation and the distribution of power influence global issues.

Cultural Pluralism and the Tyranny of the 'Shoulds'

Historically, group relations between White Anglo and all other racial–cultural groups in the USA have influenced psychological, social, and cultural adjustment for members of dominant (e.g., mainly White Anglo-Saxon) and subordinate cultural (e.g., visible racial–cultural) groups. For example, from the mid-1700s to the early 1880s, the melting pot concept (Zangwill, 1910) assumed all entering US inhabitants would willingly relinquish indigenous heritages and adopt existing White Anglo-Saxon cultural norms. From the late 1880s to the mid-1950s, this biologically blended melting pot became '*Americanized*' (Fairchild, 1926). Through Americanization, the ideology of *cultural pluralism* or *cultural unity* advocated including visible racial–cultural groups into 'mainstream' American culture. Symbolic appreciation for diversity, especially from other civilizations beside White-European societies through congressional legislation and Supreme Court decisions in the 1960s and 1970s furthered the cultural pluralist movement. However, while White European immigrants were expected to assimilate dominant White Anglo-Saxon cultural norms, visible racial–cultural groups were still excluded and institutionally segregated.

Thus, cultural pluralism ideology was contradictory to the realities of the American 'melting pot.' While preserving cultural and social heritages as a means to creating a new society, economic, political, and educational separatism for visible racial–cultural groups was creating a 'tyranny of the shoulds' – idealized images and standards imposed upon visible racial–cultural people by the dominant society resulting in the suppression of the 'true self' (Horney, 1950). Despite conformist trends throughout the nineteenth century, voices of dissent and the 'tyranny of the shoulds' was heard in the words of W.E.B. Dubois as:

> …a peculiar sensation, this double consciousness, this sense of always looking at one's self through the eyes of others, of measuring one's soul by the tape of the world that looks on in amused contempt and pity. One ever feels his two-ness – an American, a Negro; two souls, two thoughts, two unreconciled strivings; two warring ideals in one dark body, whose dogged strength alone keeps it from being torn asunder.
>
> 1989, p. 3

At some level, cultural pluralism may have enabled visible racial–cultural people to exist in threatening environments. However, the consequences of vigilance against repressive environments also created unnecessary personal and group self-doubt, alienation, and isolation from resources and support, thus limiting a person's ability to achieve their full potential.

Cultural Pluralism and Cross-Cultural Psychology

While the expressions such as 'cross-cultural,' 'diversity,' 'multicultural,' and 'cultural pluralism' have been used interchangeably, these terms have generally referred to people who are members of visible racial–cultural groups (e.g., American Indians, Blacks, Asians, Pacific Islanders, Latinos, etc.). Recognizing the health disparities of these visible racial–cultural groups, the cross-cultural psychology movement has been focused upon improving mental health services for members of these groups. Thus, cross-cultural psychology presumed that "cross-cultural counseling problems were most likely to occur when there was a low degree of client–counselor assumed similarity…[where] the practitioner is…a member of the majority group and the client is a minority group member…[and] include[s]…counselor/therapist and client… minority individuals, but represent[ing] different minority groups ([B]lack-Hispanic, Asian-American-American Indian)" (Sue et al., p. 47). By appreciating group differences,

cross-cultural psychologists believed that understanding racial–cultural group specific knowledge (e.g., values, customs, communication patterns) would eliminate racial–cultural mental health disparities. For example, misunderstandings arising from cultural variations in values and language were suggested as antecedents to early psychotherapy terminations at rates greater than 50% as compared with 30% for White clients (Sue and Sue, 1999).

Recognizing that the majority of mental health educators and practitioners are White, professional organizations developed guidelines endorsing cross-cultural culture-specific heritage education about specific visible racial–cultural groups (e.g., Blacks, American Indians, Asian and Pacific Islanders, Latinos) in hopes that sensitizing White practitioners to issues of 'culturally different' people, practitioners would become more effective counselors (American Psychological Association, 1991; Sue et al., 1982, 1992). For example, a plethora of information exists about group-specific racial–cultural knowledge about self-expression, norms, family structures, and values for 'special populations' (e.g., restraint of emotions and hierarchical relationships for Asian American clients, extended family and religion for Latino and Black clients and harmony and cooperation among American Indians). (It should be noted that these categories have been recently expanded to include Whites, socioeconomic status, ethnicity, religion, gender, age, etc. and effects of institutional racism, classism, and sexism (Sue and Sue, 1999).)

Thus, cross-cultural educational strategies have virtually used the 'othered'-focused (Sue and Sue, 1999) or universal (Fischer et al., 1998, p. 561) perspectives when teaching about cultural issues. If cultural pluralism and cross-cultural psychology have been effective in equity and inclusion of underserved visible racial–cultural groups, why does racial–cultural separatism continue to exist?

Several reasons can account for this ongoing separatist phenomenon. Overall, cultural pluralism has not provided meaningful principles about psychological well-being. Beyond obvious axioms such as all humans have language, social systems, emotions, and values and cultural norms, identification of group understanding perceived specific racial–cultural groups by group comparisons has neglected existing within-group variation. The results have been simplistic caricatures about service delivery, cultural norms, and group homogeneity. Consequently, using a social constructivist approach, multicultural psychologists have begun developing more inclusive, affective, and intrapsychic approaches to applied mental health.

Moving from Cross-Cultural to Multicultural Psychology

Understanding people from a multicultural perspective has meant simultaneously recognizing individual and group identities. From this perspective, culture accounts for internal and external personal and social realities by becoming distinct from biological and geographical heritage. In this regard, the importance of racial–cultural self-exploration of understanding explicit content knowledge and implicit affective processes has been most illustrative in the clinical bias literature where scholars have shown mental health professionals' susceptibility to clinical bias (Oakes et al., 1994). Given issues of professional and personal bias, applied psychology and other mental health training programs have been remiss when addressing how personal assumptions influence professional development. Lacking has been a counselor-focused framework incorporating a multiculturally inclusive perspective. By challenging people's beliefs and assumptions about who they are as cultural people, mental health professionals can more realistically contextualize how social, historical, and political processes have influenced their personal and professional development.

While the enumerations of attributes for cross-cultural competencies (Sue et al., 1982) were expanded from 11 to 31 in 1992 (Sue et al., 1992), the 1998 multicultural competency guidelines (Sue et al., 1998) have taken a fundamental shift toward being more culturally inclusive by focusing upon issues of within-group variation (e.g., counselor *and* client racial–cultural identity development into counseling relationships, interventions, and processes) and proposing greater latitude in defining professional roles and responsibilities. Here, multicultural unlike cross-cultural psychology has suggested mere intellectual understanding of visible racial–cultural groups' norms does not meaningfully translate into adequate or sufficient counseling skills.

Thus, the movement from cross-cultural to multicultural psychology has involved a fundamental shift of cognitive learning about (e.g., between-group differences) visible racial–cultural groups to an integrated cognitive-affective racial–cultural identity (within-group/individual variation) orientation. Thus, clarifying ones' own racial and cultural identities, developing a sense of comfort and self-acceptance within a social, historical, and political framework, and respectfully relating and functioning with all racial–cultural groups have become essential prerequisites for developing multicultural competence (Carter, 1995; Sue et al., 1998).

Multicultural Psychology and Racial–Cultural Identity Development

People throughout time have been challenged to understand their sense of self and life experiences in unifying ways. As critical tools for cultural understanding, racial–cultural identity development models have been considered "one of the most promising approaches to the field of multicultural counseling/therapy" (Sue and Sue, 1999, p. 123). By incorporating sociopolitical contexts, racial identity theories have provided a structure of how to understand life experiences, perceptions, attitudes, and behaviors of one's own and other racial–cultural groups, identity formation and intragroup variation.

Diagnostically, racial–cultural identity models also have clinical utility by framing how individuals' experiences of counseling are influenced by their racial–cultural identity and not simply linked to presumed racial–cultural group affiliations (Carter, 1995).

Racial–cultural identity attitude theories are dynamic identity models representing developmental ego differentiation and have existed for Blacks, other visible racial–cultural people (e.g., Asian, Latino, women), and Whites since the early 1970s (Sue and Sue, 1999). Racial identity attitudes are the psychological consequences of racial socialization.

Whereas people are socialized in racialized environments, racial–cultural ego identity development is the psychological reaction to the benefits and consequences of racial–cultural social systems. Involving simultaneous perspectives of oneself in relation to members of dominant and subordinate groups, people with less developed racial–cultural ego identity statuses hold more simplistic and unexamined notions about race and race relations while greater differentiated racial–cultural ego identity statuses are based on more accurate and examined personal and group information and experiences. Thus, a person's presumed racial–cultural phenotype does not preclude racial–cultural orientation. Rather, a person's overall psychological self that has been validated, denied, or ignored influences the manner in which racial identity has been integrated into one's personality and psychological well-being. By exploring the psychological aspects of how feelings, thoughts, and behaviors people have about their own and other's race, a more realistic understanding of *who* a person rather than *what* a person is becomes possible.

Racial Identity Theory

Based upon internal racial identification levels, racial identity models have provided a framework for understanding intragroup socioracial psychological perspectives. According to Black racial identity theory (and more broadly, People of Color Identity Theory), Black people develop from (1) overvaluing and idealizing White cultural norms and internalizing negative stereotypes of Blacks (Preencounter); (2) feeling confusion as they try to understand their previously held beliefs of White superiority and Black inferiority (Encounter); (3) affirming 'Blackness' and denigrating 'Whiteness' by idealizing African cultural heritage and withdrawing from White society (Immersion); (4) accepting strengths and weaknesses of Black people and incorporating a more affirming and realistic Black identity (Emersion); (5) intellectually assessing and responding to Whites (internalization); and (6) integrating a positive Black identity while maintaining a balanced perspective of 'Whiteness' motivated by personal preferences rather than racial group self-denial (Integrative Awareness) (Carter, 1995).

In White racial identity theory, identity development involves the abandonment of racism and the development of a nonracist White identity by moving from (1) being unaware of their own racial group and ignoring the race of others (Contact); (2) becoming aware of the saliency of Whiteness, feeling guilty over personal internal standards and societal norms about race and overidentifying with Blacks (Disintegration); (3) rejecting Blacks and over idealizing Whiteness (Reintegration); (4) intellectualizing rather than emotionally understanding race (Pseudoindependence); (5) exploring biases and redefining Whiteness by trying to change Whites instead of Blacks (Immersion/Emersion); and (6) emotionally and intellectually internalizing a positive White identity through appreciation for and respect of racial differences and similarities (Autonomy) (Carter, 1995).

Overall, for visible racial–cultural people, as members of less powerful sociocultural groups, the primary socioracial identity issue in developing racial–cultural identity means overcoming internalized negative stereotypes associated with their racial–cultural group affiliation. For Whites, as members of the dominant sociocultural group, racial–cultural identity development means overcoming entitled stereotyping, learning self-value and appreciation as a White person. Therefore, in efforts to serve as racial–cultural change agents, all people must seek and promote racial–cultural affirmation – the experience of having various facets of their racial–cultural identities validated for themselves and by others. Thus, the strength of racial–cultural identity models has relied upon their dynamic nature of understanding within-group racial–cultural variation within a social, historical, and political context as well as their diagnostic value for informing counseling processes and outcomes.

Whether its sociopolitical forces versus poor psychological functioning, racial–cultural issues are silent or powerful environmental and psychological realities in a person's development. By examining how racial–cultural issues influence psychological phenomena, therapists can help clients discover how their racial–cultural ego identity forms a filter whose thoughts, feelings, and behaviors organize perceptions and interpretations of thoughts, emotions, and psychological life. To this end, racial–cultural identity models provide a framework understanding personal racial–cultural intrapsychic phenomena within and between people.

Conclusions

Since the 1970s, scholars, educators, and applied mental health professionals have become increasingly aware that for the needs of all clients to be met, multicultural psychology is a needed and essential change for the profession (American Psychological Association [APA], 1991). However, since the original cross-cultural counseling competencies position paper (Sue et al., 1982) to the latest multicultural competences (Sue et al., 1998), educators' ambivalence toward programmatic multicultural education has continued through decreasing multicultural-related courses in counselor preparation programs (Hollis and Wantz, 1994), lack of comprehensive training models (Ridley et al., 1994), and professionals who continue to perceive themselves as having limited multicultural counseling competence providing mental health services (Allison et al., 1994).

As intellectual knowing does not necessarily translate into sufficient multicultural counseling competence, multicultural psychology in the twenty-first century must mean looking beyond the cross-cultural 'tyranny of shoulds' of cultural groups' differences toward racial–cultural self-reflection. As mental health professionals' worldviews are neither neutral nor culture-free; questions posed, studies designed, and results interpreted will be inherently influenced by their racial–cultural perspectives.

As Gordon (1999) so aptly states:

> I like to remind people who cannot recognize it that I am an African-American male, born in the United States in the 20th century, and that these things influence me and what I do. They influence the way I think about things. When I identify a problem, to investigate, I bring my African-American, 20th century, male person to bear on it. That person is likely to be somewhat different from some of my colleagues who do not share my particular background and

> identity….each of us bring to our work may be different. Most important is that those perspectives may influence our respective findings as well as our interpretations–even though we may like to think of findings as being objective (p. 150).

Thus, cognitively and affectively understanding ones' own racial and cultural identities and developing a sense of comfort and self-acceptance are essential prerequisites for developing multicultural competence. Accordingly, cognitive-affective reflective learning of personal and social identities has been shown to be a powerful and effective method of developing multicultural counseling competence (Carter, 1995).

For example, an ecological person-process training framework has been successful in allowing trainees to gain multicultural counseling competence (Tomlinson-Clarke and Ota Wang, 1999). Allowing examination of *who* a person is, this model has emphasized how intra-/intergroup processes influence personal and social racial–cultural identity development. Here, people have been conceptualized within interlocking dynamic systems of: personal individual interactions (microsystem); institutions directly influencing individuals (mesosystem); institutional policies (exosystem); and the overall zeitgeist (Tomlinson-Clarke and Ota Wang, 1999).

Unfortunately, while everyone has potential to develop multicultural competence, sociocultural environments have often imposed barriers of *conformity*, *prejudice*, and *oppression*, limiting essential cognitive and racial–cultural flexibility. Moreover, to varying degrees, people have been overtly or covertly subjected to these obstructions. For example, in *conformity* – the prevalence of expected societal, institutional, or self-imposed mythical ideals (e.g., White, blonde, blue-eyed people are smarter than those who have darker complexions) have often resulted in feelings of inferiority for those who do not fit these ideals and of superiority for those who do. Beyond limiting, these mythical ideals have also prevented others from recognizing the value of diversity. In *prejudice* – those who hold the power in society and in institutions have denied equity to people who are different from them by conveying messages of 'you cannot be successful unless your phenotype, attitudes, and behaviors are similar to ours.' Because prejudice promotes group and cultural superiority, its destructive forces have artificially separated racial–cultural groups. And with *oppression*, this barrier has been socially and personally destructive due to mythical prescriptions for visible racial–cultural people to be *what they are not* while exploiting them for *being who they are* as means for keeping them from true full participation in society.
